Injection size: 20 μ L for *System suitability solution*; and 100 μ L for *Standard solutions* and *Sample solution*

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Plate count: NLT 80% of the value that is certified by the column manufacturer for new columns, determining the plate count for the ethylene glycol peak, *System suitability solution*

Resolution: NLT 1.7 between the PEG standards, *Standard solution*. [NOTE—The resolution between the PEG standard with a molecular weight of 1,000,000 Da and its adjacent PEG standard should be NLT 1.0 if 1.7 cannot be met.]

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine elution peak maxima and corresponding retention volumes (elution volume), V_p , for the ten

PEG standards, corresponding to the specified molecular weight, M_p , at the peak maximum of the standards.

Molecular weight calibration: Analyze each polyethylene glycol standard, and use a suitable gel-permeation chromatography or size-exclusion chromatography (GPC/SEC) software, or an equivalent data handling system, to compute the data and calibration. Plot $\log M_p$ for each standard in the *Standard solutions* versus its retention volume, V_p , in mL, at each standard peak maximum, and construct the best polynomial line fitting the ten points.

Data analysis for sample: [NOTE—Based on the PEG molecular weight calibration curve, calculate the molecular weight and molecular weight distribution of Chitosan using the slice by slice method.]

Analyze the Chitosan sample by identifying retention volumes V_a and V_b corresponding to the beginning and end of the Chitosan chromatogram. The baseline between V_a and V_b is assumed to be linear. [NOTE—Draw a straight line between V_a and V_b .] Data analysis is based on a suitable GPC/SEC computer software or a real-time data acquisition system with either off-line or on-line data processing that is able to provide a means of determining chromatographic peak heights or integrated area segments as prescribed intervals under the SEC chromatogram and handling and reporting the data. The following describes the data processes which can either be computed by the GPC/SEC software or by an equivalent data processing system. Upon acquisition, handle the data under the Chitosan elution peak in discrete segments A_i , integrated area slices, or as digitized chromatogram heights H_i by recording the vertical displacements between the chromatogram trace and the baseline at elution volume, V_i , over designated intervals. A minimum of 40 area segments or heights are required. Obtain the corresponding value of M_i for Chitosan based on its elution volume, V_i , from the molecular weight calibration curve obtained in *Molecular weight calibration*.

Calculate the number-, and weight-average molecular weights, M_n and M_w , in g/mol, respectively, using the following formulas.

$$M_n = \frac{\sum_{i=1}^N A_i}{\sum_{i=1}^N \left(\frac{A_i}{M_i} \right)}$$

$$M_w = \frac{\sum_{i=1}^N (A_i \cdot M_i)}{\sum_{i=1}^N A_i}$$

If the elution volume internal ΔV_i , for instance, $V_2 - V_1 = V_3 - V_2$, etc, is constant; parameters A_i and M_i are the chromatographic peak slice area and Chitosan molecular weight associated with the elution volume, V_i ; and N is the number of data points obtained from the chromatogram between V_a and V_b ($N \geq 40$). [NOTE—If N is sufficiently large, the use of area segments A_i or peak heights H_i will yield equivalent results.]

Calculate the molecular weight distribution or polydispersity for Chitosan using the following expression:

$$\text{Result} = M_w/M_n$$

¹¹ Suitable polyethylene glycol molecular weight standards are available as ReadyCal kits from Polymer Standards Service (PSS), www.polymer.de.

Acceptance criteria: The values of apparent weight-average molecular weight and polydispersity are NLT 85% and NMT 115% of their respective values stated on the label.

- **LOSS ON DRYING** (731): Dry 1.0 g in an oven at 100°–105° for 7 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in light-resistant and well-closed containers in a dry place, and store at a temperature below 30°.
- **LABELING:** Label it to indicate its apparent weight-average molecular weight, M_w , and polydispersity (M_w/M_n). Where Chitosan is intended for use in the manufacture of wound dressings, it is so labeled. Where Chitosan must be subjected to further processing during the preparation of wound dressings, it is so labeled. Label to indicate the natural source from which Chitosan is derived.
- **USP REFERENCE STANDARDS** (11)
USP Chitosan RS
USP Endotoxin RS

Chlorobutanol

$C_4H_7Cl_3O$	177.46
$C_4H_7Cl_3O \cdot \frac{1}{2}H_2O$	186.46
2-Propanol, 1,1,1-trichloro-2-methyl-; 1,1,1-Trichloro-2-methyl-2-propanol [57-15-8]. Hemihydrate [6001-64-5].	

DEFINITION

Chlorobutanol is anhydrous or contains NMT one-half molecule of water of hydration. It contains NLT 98.0% and NMT 100.5% of chlorobutanol ($C_4H_7Cl_3O$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.**

Sample solution: 5 mg/mL, freshly prepared solution

Analysis: To 5 mL of the *Sample solution* add 1 mL of 1 N sodium hydroxide, then slowly add 3 mL of iodine TS.

Acceptance criteria: A yellow precipitate of iodoform, recognizable by its odor, appears.

ASSAY

• PROCEDURE

Denatured alcohol: 10% of isopropyl alcohol in alcohol
Potassium hydroxide solution: Prepare fresh just before use. Transfer 58 g of potassium hydroxide to a 1000-mL flask. Add 100 mL of water to dissolve, then cool the solution. Dilute with *Denatured alcohol* to volume.

Sample: 100 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Electrode: Silver-billet combination electrode, consisting of a metallic silver indicator electrode and a double junction reference electrode that allows use of a nonchloride filling solution (such as ammonium nitrate solution) for determining chloride, or equivalent

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Potentiometric

Analysis: Transfer the *Sample* to a glass-stoppered, flat-bottomed boiling flask. Add 50 mL of *Potassium hydrox-*

ide solution, attach the flask to a reflux condenser, and reflux for 1 h. Allow the flask to cool while still attached to the condenser, then add 100 mL of water, using a portion of the water to rinse the condenser and its tip. Add 15 mL of nitric acid while stirring. Titrate with *Titrant*. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 5.915 mg of chlorobutanol ($C_4H_7Cl_3O$).

Acceptance criteria: 98.0%–100.5% on the anhydrous basis

IMPURITIES

• CHLORIDE

Control solution: 0.50 mL of 0.020 N hydrochloric acid in a mixture of 25 mL of diluted alcohol and 1 mL of nitric acid

Sample solution: 0.50 g of Chlorobutanol in a mixture of 25 mL of diluted alcohol and 1 mL of nitric acid

Analysis: To the *Control solution* and *Sample solution* add 2 mL of silver nitrate TS.

Acceptance criteria: 0.07%; any turbidity produced in the *Sample solution* is NMT that produced in the *Control solution*.

SPECIFIC TESTS

- **WATER DETERMINATION, Method I** (921): NMT 1.0% (anhydrous form) and NMT 6.0% (hydrous form)

• REACTION

Sample: 0.5 g

Analysis: Shake the *Sample* thoroughly with 25 mL of water.

Acceptance criteria: The water remains neutral to litmus.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate whether it is anhydrous or hydrous.
- **USP REFERENCE STANDARDS** (11)
USP Chlorobutanol RS

Chlorocresol

C_7H_7ClO	142.58
Phenol, 4-chloro-3-methyl-; 4-Chloro- <i>m</i> -cresol [59-50-7].	

DEFINITION

Chlorocresol contains NLT 99.0% and NMT 101.0% of C_7H_7ClO (4-chloro-3-methylphenol).

IDENTIFICATION

• A.

Sample solution: Dissolve 40 mg of Chlorocresol in 10 mL of water.

Analysis: Add 1 drop of ferric chloride TS to the *Sample solution*.

Acceptance criteria: A blue color develops.

• B.

Sample: 50 mg

Analysis: Transfer the *Sample* to a crucible, add 500 mg of anhydrous sodium carbonate, and mix. Heat the mixture until fused. Cool, add 5 mL of water, and boil. Acidify with 1 mL of nitric acid, filter, and add 1 mL of silver nitrate TS to the filtrate.

Acceptance criteria: A white precipitate is formed.

ASSAY

• PROCEDURE

Sample: 70 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to an iodine flask, add 30 mL of glacial acetic acid, 25.0 mL of 0.1 N bromine VS, 10 mL of potassium bromide solution (150 mg/mL), and 10 mL of hydrochloric acid.

Immediately insert the stopper, and allow to stand for 15 min, protected from light. Quickly add 10 mL of potassium iodide solution (100 mg/mL) and 100 mL of water, taking precautions against the escape of bromine vapor. Immediately insert the stopper, and shake the mixture thoroughly. Remove the stopper, and rinse it and the neck of the flask with a small quantity of water so that the washing flows into the flask. Add 1 mL of chloroform, and shake the mixture thoroughly.

Titrate the liberated iodine with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination. Each mL of 0.1 N bromine VS is equivalent to 3.565 mg of C₇H₇ClO (4-chloro-3-methylphenol).

Acceptance criteria: 99.0%–101.0%

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE** (741): 63°–66°

• **LIMIT OF NONVOLATILE RESIDUE**

Sample: 1.0 g

Analysis: Heat the *Sample* in a tared crucible on a steam bath until it has evaporated, and dry the residue at 105° for 1 h.

Acceptance criteria: NMT 0.1%

• **COMPLETENESS OF SOLUTION**

Sample: 1 g

Analysis: Transfer the *Sample* to a test tube, add 0.4 mL of alcohol, and shake.

Acceptance criteria: The solution is complete.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Chocolate

DEFINITION

Chocolate is a powder prepared from the roasted, cured kernels of the ripe seed of *Theobroma cacao* L. (Fam. Sterculiaceae). Chocolate yields NLT 10.0% and NMT 22.0% of nonvolatile ether-soluble extractive.

COMPOSITION

• **CONTENT OF NONVOLATILE ETHER-SOLUBLE EXTRACTIVE**

Sample: 10 g of Chocolate

Analysis: Extract the *Sample* with anhydrous ethyl ether in a continuous-extraction apparatus for 8 h. Allow the ether solution to evaporate spontaneously in a suitable tared container, dry at 105° for 1 h, and weigh the nonvolatile ether-soluble extractive. [NOTE—Retain the ether-insoluble residue for the test for *Botanic Characteristics*, *Total Ash*, *Acid-Insoluble Ash*, and *Crude Fiber*.]

Acceptance criteria: 10.0%–22.0%

CONTAMINANTS

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total bacterial count does

not exceed 5×10^3 cfu/g, and it meets the requirements of the tests for absence of *Escherichia coli*, a 10-g specimen being used.

SPECIFIC TESTS

• **BOTANIC CHARACTERISTICS**

Microscopic: It shows numerous broken parenchyma cells of the cotyledons containing a reddish brown or purplish brown to yellowish orange pigment; numerous starch grains; oil globules; aleurone grains; and occasionally acicular or prismatic crystals of fat. The starch grains are simple and two- to three-compound, the single grains up to 15 μ m in diameter, and they stain slowly with iodine TS. The ether-insoluble residue retained from the *Content of Nonvolatile Ether-Soluble Extractive* shows few or no fragments of cocoa shells and no cereal starch grains.

• **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561)

Sample: Use the ether-insoluble residue of *Content of Nonvolatile Ether-Soluble Extractive*.

Acceptance criteria: NMT 8.0%

• **ARTICLES OF BOTANICAL ORIGIN, Acid-Insoluble Ash** (561)

Sample: Use the ether-insoluble residue of *Content of Nonvolatile Ether-Soluble Extractive*.

Acceptance criteria: NMT 0.4%

• **ARTICLES OF BOTANICAL ORIGIN, Crude Fiber** (561)

Sample: Use the ether-insoluble residue of *Content of Nonvolatile Ether-Soluble Extractive*.

Acceptance criteria: NMT 7.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Chocolate Syrup

DEFINITION

Prepare Chocolate Syrup as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Chocolate	180 g
Sucrose	600 g
Liquid Glucose	180 g
Glycerin	50 mL
Sodium Chloride	2 g
Vanillin	0.2 g
Sodium Benzoate	1 g
Purified Water, a sufficient quantity to make	1000 mL

Mix *Chocolate* and *Sucrose*, and to this mixture gradually add a solution of *Liquid Glucose*, *Glycerin*, *Sodium Chloride*, *Vanillin*, and *Sodium Benzoate* in 325 mL of hot *Purified Water*. Bring the entire mixture to a boil, and maintain at boiling temperature for 3 min. Allow to cool to room temperature, and add sufficient *Purified Water* to make the product measure 1000 mL.

[NOTE—Chocolate containing NMT 12% of nonvolatile, ether-soluble extractive ("fat") yields a Syrup having a minimum tendency to separate. "Breakfast Chocolate" contains over 22% of "fat".]

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight containers, and avoid exposure to excessive heat.

Cholesterol

$C_{27}H_{46}O$ 386.65
 Cholest-5-en-3-ol, (3 β)-;
 Cholest-5-en-3 β -ol [57-88-5].

DEFINITION

Cholesterol is a steroid alcohol used as an emulsifying agent.

IDENTIFICATION

- **A.**
Sample solution: 10 mg in 1 mL of chloroform
Analysis: To the *Sample solution* add 1 mL of sulfuric acid.
Acceptance criteria: The chloroform acquires a blood-red color, and the sulfuric acid shows a green fluorescence.
- **B.**
Sample: 5 mg
Analysis: Dissolve the *Sample* in 2 mL of chloroform, add 1 mL of acetic anhydride, and follow with 1 drop of sulfuric acid.
Acceptance criteria: A pink color is produced, and it rapidly changes to red, then to blue, and finally to a brilliant green.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 147°–150°
- **OPTICAL ROTATION, Specific Rotation** (781S)
Sample solution: 20 mg/mL, undried, in dioxane
Acceptance criteria: –34° to –38°
- **ACIDITY**
Sample: 1.0 g
Analysis: Dissolve the *Sample* in 10 mL of ether in a small flask, add 10.0 mL of 0.10 N sodium hydroxide, and shake for about 1 min. Heat gently to expel the ether, and then boil for 5 min. Cool, dilute with 10 mL of water, add phenolphthalein TS, and titrate with 0.10 N sulfuric acid until the pink color just disappears, stirring the solution vigorously throughout the titration. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*).
Acceptance criteria: The difference between the number of mL of 0.10 N sulfuric acid consumed in the blank and the number of mL consumed in the *Sample* is NMT 0.3 mL.
- **LOSS ON DRYING** (731)
Analysis: Dry under vacuum at 60° for 4 h.
Acceptance criteria: NMT 0.3%
- **SOLUBILITY IN ALCOHOL**
Sample: 500 mg
Analysis: Dissolve the *Sample* in 50 mL of warm alcohol in a stoppered flask or cylinder, and allow to stand at room temperature for 2 h.
Acceptance criteria: No deposit or turbidity is formed.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.

Anhydrous Citric Acid—see *Anhydrous Citric Acid General Monographs*

Citric Acid Monohydrate—see *Citric Acid Monohydrate General Monographs*

Clove Oil

DEFINITION

Clove Oil is the volatile oil distilled with steam from the dried flower buds of *Syzygium aromaticum* (L.) Merr. and L. M. Perry (Fam. Myrtaceae). It contains NLT 85.0% of total phenolic substances, chiefly eugenol ($C_{10}H_{12}O_2$).

ASSAY

PROCEDURE

Sample: 10 mL of Clove Oil

Analysis: Pipet the *Sample* into a suitable cassia flask, the neck of which is graduated from 0–6 mL at intervals of 0.1 mL. Add 75 mL of 1 N potassium hydroxide, and shake the mixture for 5 min. Heat for 10 min in boiling water, shaking the flask at least 3 times during the heating. Remove the flask from the bath, and cool to room temperature. When the liquids have separated completely, add sufficient 1 N potassium hydroxide to raise the lower level of the oily layer so that it is within the graduated portion of the neck. Measure the volume of the oily layer after standing for 18 h.

Acceptance criteria: NMT 1.5 mL, indicating the presence of NLT 85.0%, by volume, of total phenolic substances in the Oil

IMPURITIES

- **HEAVY METALS, Method II** (231): NMT 40 μ g/g
- **LIMIT OF PHENOL**

Sample: 1 mL of Clove Oil

Analysis: Shake the *Sample* with 20 mL of hot water: the water shows not more than a scarcely perceptible acid reaction with blue litmus paper. Cool the mixture, pass the water layer through a wetted filter, and treat the clear filtrate with 1 drop of ferric chloride TS.

Acceptance criteria: The mixture exhibits only a transient, grayish-green color, but not a blue or violet color.

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 1.038–1.060
- **OPTICAL ROTATION, Angular Rotation** (781A): It is optically inactive or slightly levorotatory. The angular rotation is not greater than –1.5°.
- **REFRACTIVE INDEX** (831): 1.527–1.535 at 20°
- **SOLUBILITY IN 70% ALCOHOL:** One volume dissolves in 2 volumes of 70% alcohol.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-filled, tight containers, and avoid exposure to excessive heat.
- **LABELING:** The label states the Latin binomial name and, following the official name, the part of the plant source from which the article was derived.

Cocoa Butter

DEFINITION

Cocoa Butter is the fat obtained from the seed of *Theobroma cacao* L. (Fam. Sterculiaceae).

SPECIFIC TESTS

• FATTY ACID COMPOSITION

Sample solution: Place 100–150 mg of Cocoa Butter in a 50-mL round-bottom flask, and add 4 mL of 0.5 N sodium hydroxide solution, prepared in methanol. Add a few boiling chips to the flask, connect the round-bottom flask to a condenser, and boil the mixture under total reflux until the fat globules go into solution. Add 5.0 mL of a 2.0 M borontrifluoride in methanol solution to the boiling mixture via the condenser, and continue boiling for 2 min. Add 2–5 mL of chromatographic *n*-heptane to the boiling mixture via the condenser, and boil for another min. Remove the flask from the source of heat, and remove the reflux condenser. Add saturated sodium chloride solution, and swirl the flask gently. Add more of the saturated sodium chloride solution to bring the liquid level into the neck of the round-bottom flask. Transfer 1 mL of the organic layer into a glass-stoppered test tube, add some anhydrous sodium sulfate to remove the last traces of water, and filter. Use the filtrate.

System suitability solution: 1 mg/mL each of methyl stearate and methyl oleate, in *n*-heptane

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 15-m fused-silica capillary; 0.25-μm stationary phase G19 coating

Temperature

Detector: 250°

Injection port: 250°

Column: See Table 1.

[NOTE—The components of interest elute during the temperature program. The final hold at a temperature of 240° serves only to facilitate elution of higher boiling components.]

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
180	10	240	5

Carrier gas: Helium

Linear velocity: 48 cm/s

Injection size: 0.1 μL

Injection type: Split

Split ratio: 60:1

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for stearate and oleate are about 0.97 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the stearate and oleate peaks

Relative standard deviation: NMT 5.0%

Analysis

Sample: *Sample solution*

Measure the areas for the peaks of the methyl esters of the fatty acids. [NOTE—The relative retention times for palmitate, stearate, oleate, linoleate, linolenate (if present), and arachidate are about 1.0, 1.55, 1.60, 1.72, 1.89, and 2.30, respectively.]

Calculate the percentage of each fatty acid methyl ester in the portion of Cocoa Butter taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = response of each peak

r_T = sum of the responses of all of the peaks

Acceptance criteria: See Table 2.

Table 2

Fatty Acid Methyl Ester	Relative Retention Time	Percentage (%)
Palmitate	1.0	23–30
Stearate	1.55	31–37
Oleate	1.60	31–38
Linoleate	1.72	1.6–4.8
Linolenate (if present)	1.89	0–1.5
Arachidate	2.30	0–1.5

• MELTING RANGE

Analysis: Melt the material to be tested at a temperature of 50°–60°. Place 50 g of the melted material in a beaker, and cool in a water bath at 25°. Stir continuously until it assumes a pasty consistency, taking care to avoid the inclusion of air bubbles. Place the beaker in a water bath maintained at a temperature of 32°–33°. Continue stirring until the specimen reaches the temperature of the water bath and changes to a liquid cream (about 30 min). Pour the contents into another beaker, and allow it to solidify at room temperature for at least 2 h. Press one side of a U-shaped capillary tube, 1.5 mm in diameter and 80 mm in length with a distance of 10 mm between both capillaries, into the solidified specimen. Using a very fine metal rod, push the column down to 10 mm before the bend of the U-tube. Then attach the other arm of the U-tube to a precision thermometer (having 0.1° graduations) by suitable means, with the U-tube bend at the level of the thermometer bulb. Insert the thermometer into a water bath so that the upper edge of the material is at least 20 mm below the surface, and heat as directed under *Melting Range or Temperature* <741>, *Class I* except, within 5° of the expected melting temperature, regulate the rate of the temperature rise so that it does not exceed 0.2°/min.

Acceptance criteria: The slip point (temperature at which the column visibly flows toward the bend in the tube) is 30°–34°. The clear melting point (clarity via magnifying glass) is 31°–35°.

• **REFRACTIVE INDEX** <831>: 1.454–1.459 at 40°

• **FATS AND FIXED OILS, Free Fatty Acids** <401>: The free fatty acids in 10.0 g of it require for neutralization NMT 5.0 mL of 0.10 N sodium hydroxide (1.4% as oleic acid).

• **FATS AND FIXED OILS, Iodine Value** <401>: 33–42

• **FATS AND FIXED OILS, Saponification Value** <401>: 188–198

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Coconut Oil

Coconut oil [8001-31-8].

DEFINITION

Coconut Oil is the refined fixed oil of the seeds of *Cocos nucifera* L. (Fam. Palmae).

IDENTIFICATION

- **A.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* (401).

IMPURITIES

- **ARSENIC**, *Method II* (211): NMT 0.5 µg/g

• **ALKALINE IMPURITIES**

Sample: 10 mL of Coconut Oil

Analysis: Mix 10 mL of freshly distilled acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. Neutralize the solution to a green color if necessary with 0.01 N hydrochloric acid or 0.01 N sodium hydroxide. Add the *Sample*, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow.

Acceptance criteria: NMT 0.1 mL of 0.01 N hydrochloric acid VS is required.

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 0.5, determined on 20.0 g
- **FATS AND FIXED OILS**, *Fatty Acid Composition* (401): Coconut Oil exhibits the composition profile of fatty acids, shown in *Table 1*.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
6	0	≤1.5
8	0	5.0–11.0
10	0	4.0–9.0
12	0	40.0–50.0
14	0	15.0–20.0
16	0	7.0–12.0
18	0	1.5–5.0
20	0	≤0.2
16	1	≤1.0
18	1	4.0–10.0
18	2	1.0–3.0
18	3	≤0.2
20	1	≤0.2

- **FATS AND FIXED OILS**, *Peroxide Value* (401): NMT 5.0
- **FATS AND FIXED OILS**, *Unsaponifiable Matter* (401): NMT 1.0%
- **MELTING RANGE OR TEMPERATURE** (741): 23°–26°
- **WATER DETERMINATION**, *Method I* (921): NMT 0.1%, 50 mL of chloroform being used as the solvent instead of 35–40 mL of methanol

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant, well-filled containers. No storage requirement specified.

Hydrogenated Coconut Oil

Hydrogenated coconut oil [84836-98-6].

DEFINITION

Hydrogenated Coconut Oil is the product obtained by refining and hydrogenating the oil obtained from the seeds of *Cocos nucifera* L. (Fam. Palmae).

IDENTIFICATION

- **A.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* (401).
- **B.** It meets the requirements in *Specific Tests for Melting Range or Temperature* (741).

IMPURITIES

- **RESIDUE ON IGNITION** (281)

Sample: 5 g

Acceptance criteria: NMT 0.1%

- **HEAVY METALS**, *Method II* (231): NMT 10 µg/g

• **LIMIT OF NICKEL**

Nickel standard solution: Immediately before use, prepare the equivalent of 0.2 µg/mL of nickel by diluting 10 mL of nickel standard solution TS with water to 500 mL.

Sample solution: Weigh 5.0 g of Hydrogenated Coconut Oil into a previously tared platinum or silica crucible. Cautiously heat the substance, and introduce into it a wick formed from twisted, ashless filter paper. Ignite the wick. When the substance ignites, stop heating. After combustion, ignite in a muffle furnace at about 600°. Continue the incineration until a white ash is obtained. After cooling, with the aid of two 2-mL portions of diluted hydrochloric acid, transfer the residue to a 25-mL volumetric flask, add 0.3 mL of nitric acid, and dilute with water to volume.

Standard solutions: Into four separate identical 10-mL volumetric flasks, introduce respectively 0, 1.0, 2.0, and 4.0 mL of *Nickel standard solution*. To each flask add a 2.0-mL portion of the *Sample solution*, and dilute with water to volume to obtain four *Standard solutions* containing an added quantity of nickel of 0, 0.2, 0.4, and 0.8 µg, respectively.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer, equipped with a graphite furnace

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Analysis

Samples: *Standard solutions*

Concomitantly determine the absorbances of the *Standard solutions* at least three times each. Record the average of the steady readings for each of the *Standard solutions*. Plot the absorbances of the *Standard solutions* versus the added quantity, in µg, of nickel. Extrapolate the line joining the points on the graph until it meets the quantity axis. The distance between this point and the intersection of the axes represents the quantity of nickel, in µg, in the 2-mL portion of the *Sample solution*.

Calculate the content of nickel in the portion of the sample taken:

$$\text{Result} = [V \times (A/V_A)]/W$$

V = volume of the *Sample solution*, 25 mL

A = nickel, as determined above

V_A = volume of the *Sample solution* added to the *Standard solutions*, 2 mL

W = weight of Hydrogenated Coconut Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 1 µg/g

• **ALKALINE IMPURITIES**

Sample: 2.0 g

Analysis: Dissolve the *Sample* by gently heating in a mixture of 1.5 mL of alcohol and 3.0 mL of toluene. Add 0.05 mL of bromophenol blue TS, and titrate with 0.01 N hydrochloric acid VS to a yellow endpoint.

Acceptance criteria: NMT 0.4 mL of 0.01 N hydrochloric acid VS is required.

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 30°–38°
- **FATS AND FIXED OILS**, *Acid Value*, *Method II* (401): NMT 2.0
- **FATS AND FIXED OILS**, *Fatty Acid Composition* (401): Hydrogenated Coconut Oil exhibits the following composition profile of fatty acids in *Table 1*.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
6	0	≤1.5
8	0	5.0–9.0
10	0	4.0–9.0
12	0	44.0–52.0
14	0	15.0–20.0
16	0	8.0–11.0
18	0	8.0–14.0
20	0	≤0.2
>20	0	≤0.5
16	1	≤1.0
18	1	≤1.5
18	2	≤0.5
18	3	≤0.2
20	1	≤0.2

- **FATS AND FIXED OILS, Peroxide Value** <401>: NMT 5.0
- **FATS AND FIXED OILS, Unsaponifiable Matter** <401>: NMT 0.8%
- **LOSS ON DRYING** <731>
Analysis: Dry a sample at 105° for 4 h.
Acceptance criteria: NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at a temperature not exceeding 55°.

Copovidone

Acetic acid ethenyl ester polymer with 1-ethenyl-2-pyrrolidone;
1-Vinyl-2-pyrrolidone polymer with vinyl acetate [25086-89-9].

DEFINITION

Copovidone is a copolymer of 1-vinyl-2-pyrrolidone and vinyl acetate in the mass proportion of 3:2. The nominal K-value of copovidone as stated in the labeling is NLT 90.0% and NMT 110.0%.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B.**

Sample solution: 20 mg/mL

Analysis: To 5 mL of the *Sample solution*, add a few drops of iodine TS.

Acceptance criteria: A deep red color is produced.

ASSAY

- **PROCEDURE 1: CONTENT OF COPOLYMERIZED VINYL ACETATE**
Analysis: Determine the saponification value as directed under *Fats and Fixed Oils* <401>, *Saponification Value*. Calculate the percentage of copolymerized vinyl acetate in the portion of Copovidone taken:

$$\text{Result} = 0.1 \times (M_{r1}/M_{r2}) \times S$$

M_{r1} = molecular weight of vinyl acetate, 86.09

M_{r2} = molecular weight of potassium hydroxide, 56.11

S = saponification value

Acceptance criteria: 35.3%–41.4% of the copolymerized vinyl acetate component, calculated on the dried basis

- **PROCEDURE 2: NITROGEN DETERMINATION, Method II** <461>

Analysis: Proceed as directed using 0.1 g of Copovidone. In the procedure, use 5 g of a powdered mixture of potassium sulfate, cupric sulfate, and titanium dioxide (33:1:1) instead of potassium sulfate and cupric sulfate (10:1); omit the use of hydrogen peroxide; and heat until the solution has a clear, yellow-green color and the sides of the flask are free from carbonaceous material. Then heat for a further 45 min; add 20 mL of water, instead of 70 mL, after the second heating; and use bromocresol green–methyl red TS instead of methyl red–methylene blue TS. Titrate the distillate with 0.05 N sulfuric acid VS until the color of the solution changes from green through pale grayish blue to pale grayish red-purple.

Acceptance criteria: 7.0%–8.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS** <231>

Sample solution: 100-mg/mL solution of Copovidone in water. [NOTE—Add Copovidone to water in small portions with constant stirring.]

Dilute standard lead solution: *Standard Lead Solution* in water (1 in 5)

Standard solution: *Sample solution* and *Dilute standard lead solution* (1:5)

Blank solution: *Sample solution* and water (1:5)

Analysis: To 12 mL each of the *Sample solution*, *Standard solution*, and *Blank solution*, add 2 mL of pH 3.5 *Acetate Buffer*. Mix and add to 1.2 mL of thioacetamide–glycerin base TS. Mix immediately. Examine the solutions after 2 min. [NOTE—If the result is difficult to judge, filter the solutions through a suitable membrane filter of nominal 0.45-μm pore size. Carry out the filtration slowly and uniformly, applying moderate and constant pressure to the piston. Compare the spots on the filters obtained with the different solutions.]

System suitability: The reference solution shows a slight brown color compared to the *Blank solution*.

Acceptance criteria: Any brown color in the *Sample solution* is not more intense than that in the *Standard solution* (NMT 20 ppm).

- **LIMIT OF ALDEHYDES**

Solution A: 17.4 mg/mL of monobasic potassium phosphate, adjusted if necessary, with 1 N potassium hydroxide to a pH of 9.0

Solution B: Transfer a quantity of lyophilized aldehyde dehydrogenase equivalent to 70 units to a glass vial, and dissolve in 10.0 mL of water. [NOTE—This solution is stable for 8 h at 4°.]

Solution C: 40 mg of nicotinamide adenine dinucleotide in 10 mL of *Solution A*, in a glass vial. [NOTE—This solution is stable for 4 weeks at 4°.]

Blank solution: Water

Standard solution: Transfer 2 mL of water at 4° to a glass weighing bottle, and weigh. Add 100 mg of freshly distilled acetaldehyde, and weigh. Transfer this solution to a 100-mL volumetric flask. Rinse the weighing bottle with several portions of water at 4°, and transfer each rinsing to the 100-mL volumetric flask. Dilute the solution in the 100-mL volumetric flask with water at 4° to volume. Store at 4° for 20 h. Transfer 1 mL of this solution to a 100-mL volumetric flask, and dilute with *Solution A* to volume.

Sample solution: 10 mg/mL of Copovidone in *Solution A*, in a 100-mL volumetric flask. Insert a stopper into

the flask, heat at 60° for 1 h, and cool to room temperature.

Analysis: Pipet 0.5 mL each of the *Standard solution*, *Sample solution*, and *Blank solution* into separate 1-cm cells. Add 2.5 mL of *Solution A* and 0.2 mL of *Solution C* to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 2–3 min at 22 ± 2°. Determine the absorbances of the solutions at a wavelength of 340 nm. Add 0.05 mL of *Solution B* to each cell. Cover the cells to exclude oxygen. Mix by inversion, and allow to stand for 5 min at 22 ± 2°. Determine the absorbances of the solutions at a wavelength of 340 nm. Calculate the percentage of aldehydes, expressed as acetaldehyde, in the portion of Copovidone taken:

$$\text{Result} = \frac{[(A_{U2} - A_{U1}) - (A_{B2} - A_{B1})] / [(A_{S2} - A_{S1}) - (A_{B2} - A_{B1})]}{(C/W)} \times 10$$

A_{U2} = absorbance of the solution from the *Sample solution*, after the addition of *Solution B*

A_{U1} = absorbance of the solution from the *Sample solution*, before the addition of *Solution B*

A_{B2} = absorbance of the solution from the *Blank solution*, after the addition of *Solution B*

A_{B1} = absorbance of the solution from the *Blank solution*, before the addition of *Solution B*

A_{S2} = absorbance of the solution from the *Standard solution*, after the addition of *Solution B*

A_{S1} = absorbance of the solution from the *Standard solution*, before the addition of *Solution B*

C = concentration of acetaldehyde in the *Standard solution* (mg/mL)

W = weight, calculated on the dried basis, of Copovidone taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.05%

• LIMIT OF HYDRAZINE

Standard solution: 9 µg/mL of salicylaldazine and 10 mg/mL of salicylaldehyde in toluene

Sample solution: Transfer the equivalent of 2.5 g of dried Copovidone to a 50-mL centrifuge tube, add 25 mL of water, and mix to dissolve. Add 500 µL of a 50-mg/mL solution of salicylaldehyde in methanol, adjust the solution with 0.25 N sulfuric acid to a pH of about 2, swirl, and heat in a water bath at 60° for 15 min. Allow to cool, add 2.0 mL of toluene, insert a stopper in the tube, shake vigorously for 2 min, and centrifuge. Use the clear upper toluene layer.

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of dimethylsilanized chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Acetonitrile and water (17:3)

Analysis

Samples: *Standard solution* and *Sample solution*
Proceed as directed in the chapter. Allow the spots to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Locate the spots on the plate by examination under UV light at a wavelength of 365 nm: salicylaldazine appears as a fluorescent spot having an R_f value of about 0.6–0.7, and the fluorescence of any salicylaldazine spot from the *Sample solution* is not more intense than that produced by the spot from the *Standard solution*.

Acceptance criteria: NMT 1 ppm

• LIMIT OF PEROXIDES

Copovidone solution: 40 mg/mL of Copovidone in water calculated on the dried basis

Sample solution: Transfer 25.0 mL of *Copovidone solution* to a 50-mL beaker, and add 2 mL of titanium

trichloride–sulfuric acid TS. Allow to stand for 30 min at room temperature.

Blank solution: Transfer 25.0 mL of *Copovidone solution* to a 50-mL beaker, and add 2 mL of 13% sulfuric acid.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: UV-Vis

Analytical wavelength: 405 nm

Cell: 1 cm

Blank: *Blank solution*

Analysis: Determine the absorbance of the *Sample solution*.

Acceptance criteria: The absorbance is NMT 0.35 (corresponding to NMT 0.04%, expressed as hydrogen peroxide).

• LIMIT OF MONOMERS (1-VINYL-2-PYRROLIDONE, VINYL ACETATE, AND 2-PYRROLIDONE)

Solution A: Water, acetonitrile, and methanol (90:5:5)

Solution B: Water, acetonitrile, and methanol (50:45:5)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
26	80	20
27	0	100
36	0	100
38	100	0

Standard stock solution: 0.50 mg/mL of 1-vinyl-2-pyrrolidone, 0.50 mg/mL of vinyl acetate, and 3.0 mg/mL of 2-pyrrolidone in methanol

Standard solution: *Standard stock solution* in *Solution A* (1 in 2000)

Sample solution: Dissolve 250 mg of Copovidone in 1 mL of methanol, mix ultrasonically, dilute with water to 10 mL. If necessary, filter to remove undissolved particles.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm and 235 nm

Column

Guard: 4.0-mm × 2.5-cm; packing L1

Analytical: 4.0-mm × 25-cm; 5-µm packing L1

Column temperature: 30°

Injection size: 10 µL

Flow rate: 1.0 mL/min

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between the 2-pyrrolidone and vinyl acetate peaks, and NLT 2.0 between the vinyl acetate and 1-vinyl-2-pyrrolidone peaks. [NOTE—According to the above operating conditions, the order of elution is 2-pyrrolidone, vinyl acetate, and 1-vinyl-2-pyrrolidone.]

Relative standard deviation: NMT 2.0% for each analyte, on replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—After each injection of the *Sample solution* wash the polymeric material of Copovidone from the guard column by passing the *Mobile phase* through the column backwards for 30 min at the same flow rate.]

Calculate the content of 1-vinyl-2-pyrrolidone in the portion of Copovidone taken:

$$\text{Result} = (A_{TA}/A_{SA}) \times (C_{SA}/C_T) \times 100$$

- A_{TA} = 1-vinyl-2-pyrrolidone peak response from the *Sample solution*
 A_{SA} = 1-vinyl-2-pyrrolidone peak response from the *Standard solution*
 C_{SA} = concentration of 1-vinyl-2-pyrrolidone in the *Standard solution* (mg/mL)
 C_T = concentration of Copovidone in the *Sample solution* on the dried basis (mg/mL)

Calculate the content of vinyl acetate in the portion of Copovidone taken:

$$\text{Result} = (A_{TB}/A_{SB}) \times (C_{SB}/C_T) \times 100$$

- A_{TB} = vinyl acetate peak response from the *Sample solution*
 A_{SB} = vinyl acetate peak response from the *Standard solution*
 C_{SB} = concentration of vinyl acetate in the *Standard solution* (mg/mL)
 C_T = concentration of Copovidone in the *Sample solution* on the dried basis (mg/mL)
 Calculate the content of 2-pyrrolidinone in the portion of Copovidone taken:

$$\text{Result} = (A_{TC}/A_{SC}) \times (C_{SC}/C_T) \times 100$$

- A_{TC} = 2-pyrrolidone peak response from the *Sample solution*
 A_{SC} = 2-pyrrolidone peak response from the *Standard solution*
 C_{SC} = concentration of 2-pyrrolidone in the *Standard solution* (mg/mL)
 C_T = concentration of Copovidone in the *Sample solution* on the dried basis (mg/mL)

Acceptance criteria: NMT 0.001% of 1-vinyl-2-pyrrolidone, NMT 0.001% of vinyl acetate, and NMT 0.5% of 2-pyrrolidone

SPECIFIC TESTS

- LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 5.0% of its weight.

- CLARITY AND COLOR OF SOLUTION**

Sample: 1.0 g

Analysis: Dissolve the *Sample* in 10 mL of water.

Acceptance criteria: The solution is clear or slightly opalescent and colorless to pale yellow or pale red.

- K-VALUE**

Sample solution: Transfer a quantity of undried Copovidone, equivalent to 1.0 g on the dried basis, to a 100-mL volumetric flask, and dissolve in and dilute with water to volume. Allow to stand for 1 h.

Analysis: Determine the viscosity, using a capillary-tube viscometer (see *Viscosity—Capillary Viscometer Methods* (911)), of this solution at 25 ± 0.2°.

Calculate the relative K-value of Copovidone:

$$\text{Result} = \left[\sqrt{300c \log z + (c + 1.5c \log z)^2} + 1.5c \log z - c \right] / (0.15c + 0.003c^2) \times (100/K_U)$$

- c = weight on the dried basis, of the specimen tested in each 100.0 mL of solution (g)
 z = viscosity of the *Sample solution* relative to that of water
 K_U = nominal K-value stated on the label

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.

- LABELING:** Label it to indicate its nominal K-value.
- USP REFERENCE STANDARDS** (11)
USP Copovidone RS

Coriander Oil

DEFINITION

Coriander Oil is the volatile oil obtained by steam distillation from the dried ripe fruit of *Coriandrum sativum* L. (Fam. Apiaceae).

IMPURITIES

- HEAVY METALS, Method II** (231): NMT 40 ppm

SPECIFIC TESTS

- SPECIFIC GRAVITY** (841): Between 0.863 and 0.875
- OPTICAL ROTATION, Angular Rotation** (781A): Between +8° and +15°
- REFRACTIVE INDEX** (831): Between 1.462 and 1.472 at 20°
- SOLUBILITY IN 70% ALCOHOL:** One volume dissolves in 3 volumes of 70% alcohol.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, protect from light, and store at controlled room temperature. Avoid exposure to excessive heat.
- LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived.

Corn Oil

[8001-30-7].

DEFINITION

Corn Oil is the refined fixed oil obtained from the embryo of *Zea mays* Linné (Fam. Gramineae).

IDENTIFICATION

- A.** It meets the requirements of the test for *Fats and Fixed Oils* (401), *Fatty Acid Composition*.

IMPURITIES

- ALKALINE IMPURITIES**

Sample: 10 mL of Corn Oil

Analysis: Mix 10 mL of acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. Neutralize the solution to a green color if necessary with 0.01 N hydrochloric acid or 0.01 N sodium hydroxide. Add the *Sample*, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow.

Acceptance criteria: NMT 0.1 mL of 0.01 N hydrochloric acid is required.

- HEAVY METALS, Method II** (231): NMT 10 ppm

SPECIFIC TESTS

- FATS AND FIXED OILS, Acid Value** (401): NMT 0.2
- FATS AND FIXED OILS, Fatty Acid Composition** (401): Corn Oil exhibits the composition profile of fatty acids in Table 1.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
<14	0	≤0.1
14	0	≤0.1
16	0	8.6–16.5

Table 1 (Continued)

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
16	1	≤0.5
18	0	1.0–3.3
18	1	20.0–42.2
18	2	39.4–62.0
18	3	0.5–1.5
20	0	≤0.8
20	1	≤0.5
22	0	≤0.3
22	1	≤0.1
24	0	≤0.4

- **FATS AND FIXED OILS, Peroxide Value** (401): NMT 10.0
- **FATS AND FIXED OILS, Sterol Composition** (401): The sterol fraction of the Corn Oil contains NMT 0.3% of brassicasterol.
- **FATS AND FIXED OILS, Unsaponifiable Matter** (401): NMT 1.5%
- **WATER DETERMINATION, Method I** (921): NMT 0.1%. Use a mixture of equal volumes of decanol and anhydrous methanol as the solvent.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.
- **LABELING:** Where Corn Oil is intended for use in the manufacture of injectable dosage forms, it is so labeled.
- **OTHER REQUIREMENTS:** For Corn Oil intended for use in injectable dosage forms, specified in *Labeling*, the requirements for *Acid Value*, *Peroxide Value*, *Unsaponifiable Matter*, and *Water in Other Vehicles under Injections* (1), *Ingredients* must be met.

Corn Syrup

[8029-43-4].

DEFINITION

Corn Syrup is an aqueous solution of saccharides obtained by partial hydrolysis of edible corn starch by food grade acids and/or enzymes. It contains NLT 20.0% reducing sugar content (dextrose equivalent) expressed as D-glucose, calculated on the dried basis.

IDENTIFICATION

- **A.**
Analysis: Add a few drops of a solution of Syrup (1 in 20) to 5 mL of hot, alkaline cupric tartrate TS.
Acceptance criteria: A copious, red precipitate of cuprous oxide is formed.

ASSAY• **REDUCING SUGARS (DEXTROSE EQUIVALENT)**

Apparatus: Mount a ring support on a ring stand 1–2 inches above a gas burner, and mount a second ring 6–7 inches above the first. Place 6-inch open-wire gauze on the lower ring to support a 250-mL conical flask, and place a 4-inch watch glass with a center hole on the upper ring to deflect heat. Attach a 25-mL buret to the ring stand so that the tip just passes through the watch glass centered above the flask. Place an indirectly lighted white surface behind the assembly for observing the endpoint.

Standard solution: 6 mg/mL of USP Dextrose RS

Sample solution: 10 mg/mL of Corn Syrup

Analysis: Transfer 25.0-mL portions of alkaline cupric tartrate TS to each of two flasks, and boil. Immediately place one flask on the wire gauze of the *Apparatus*, and adjust the burner so that the boiling point is reached in

about 2 min. Titrate with the *Standard solution* to within 0.5 mL of the anticipated endpoint. Heat the flask, with swirling, boil moderately for 2 min, and add 2 drops of methylene blue solution (1 in 100). Immediately add 2 drops of the *Standard solution* from the buret, and bring to a boil. Allow the cuprous oxide to settle slightly, and observe the color of the supernatant. Complete the titration within 1 min by adding the *Standard solution* dropwise, and boil after each addition to the disappearance of the blue color, as determined by viewing against a white background in daylight or under equivalent illumination. If more than 0.5 mL of the titrant is required after the addition of the indicator, repeat the titration, adding the necessary volume of titrant before adding the indicator. Bring the contents of the second flask to a boil, and similarly titrate with the *Sample solution*.

Calculate the percentage of reducing sugars as D-glucose, calculated on the dried basis, in the portion of Corn Syrup taken:

$$\text{Result} = (C_S/C_U) \times (V_S/V_U) \times [1/(0.01 \times A)] \times 100$$

C_S = concentration of USP Dextrose RS in the *Standard solution* (mg/mL)

C_U = concentration of Corn Syrup in the *Sample solution* (mg/mL)

V_S = titrated volume of the *Standard solution* (mL)

V_U = titrated volume of the *Sample solution* (mL)

A = percentage of dry solids in Corn Syrup measured by the refractive index

Acceptance criteria: NLT 20.0% reducing sugar content on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%, determined on 20 g of Corn Syrup
- **HEAVY METALS, Method II** (231): NMT 5 ppm
- **LIMIT OF LEAD**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. For digestion, use acid-cleaned, high-density polyethylene, polypropylene, polytetrafluoroethylene, or quartz tubes. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in borosilicate glass containers. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 min and rinsing with deionized water. Store final diluted solutions in acid-cleaned plastic or polytetrafluoroethylene tubes or bottles.]

Modifier solution: 200 mg/mL of magnesium nitrate. Just before use, transfer 1.0 mL of this solution to a 10-mL volumetric flask, and dilute with 5% nitric acid to volume.

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* (231), to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, dilute with 5% nitric acid to volume, and mix. This solution contains 0.1 µg/mL of lead.

Standard solutions: Transfer portions of *Standard stock solution* to four suitable containers, and dilute with 5% nitric acid to obtain *Standard solutions* having lead concentrations of 100, 50, 25, and 10 ng/mL, respectively.

Sample solution: [NOTE—Perform this procedure in a fume hood.] Transfer 1.5 g of Corn Syrup to a digestion tube, and add 0.75 mL of nitric acid to the tube. Warm the solution slowly (to avoid spattering) to 90°–95°. Heat until all brown vapors have dissipated and any rust-colored tint has disappeared from the tube (20–30 min). Cool, add 0.5 mL of 50% hydrogen peroxide,

dropwise, to the solution, heat to 90°–95° for 5 min, and cool. Add a second 0.5-mL portion of 50% hydrogen peroxide dropwise to the solution, and heat to 90°–100° until clear (5–10 min). Cool and transfer the solution to a 10-mL volumetric flask. Rinse the digestion tube with 5% nitric acid, add the rinse to the volumetric flask, dilute with 5% nitric acid to volume, and mix.

Standard blank: 5% nitric acid

Sample blank: Transfer 1.5 g of water to a digestion tube, and proceed as directed for the *Sample solution*, beginning with “add 0.75 mL of nitric acid”.

Instrumental conditions

Mode: Graphite furnace atomic absorption with pyrolytically coated graphite tubes and adequate means of background correction

Lamp: A lead hollow-cathode lamp

Analytical wavelength: Lead emission line of 283.3 nm

Furnace program: See *Table 1*. [NOTE—The temperature program may be modified to obtain optimum furnace temperatures.]

Table 1

Step	Dry	Ash	Purge	Atomize
Temperature (°)	200	750	Cool down, and purge the air from the furnace 20	1800
Ramp time (s)	20	40	—	0
Hold time (s)	30	40	60	10
Argon flow rate (mL/min)	300	300	300	Argon gas flow stopped

Injection volume: 20 µL

Analysis

[NOTE—Use peak area measurements for all quantitations.]

Samples: Add 5 µL of the *Modifier solution* to 20 µL each of the *Standard solutions*, the *Sample solution*, the *Standard blank*, and the *Sample blank*, and mix.

Separately inject equal volumes (about 20 µL) of the *Samples* into the instrument for analysis.

Using the *Standard blank* to set the instrument to zero, determine the integrated absorbances of the *Standard solutions*. Plot the integrated absorbances of the *Standard solutions* versus their contents of lead, in ng/mL, and draw the line best fitting the four points to determine the calibration curve. Similarly determine the integrated absorbances of the *Sample solution* and the *Sample blank*. Correct the absorbance value of the *Sample solution* by subtracting from it the absorbance value obtained from the *Sample blank*.

Calculate the concentration, in ppm (µg/g), of lead in the portion of Corn Syrup taken:

$$\text{Result} = (C_L \times V/W) \times F$$

C_L = concentration of lead in the *Sample solution*, as determined from the calibration curve (ng/mL)

V = volume of the *Sample solution*, 10 mL

W = weight of Corn Syrup taken to prepare the *Sample solution* (g)

F = conversion factor, 10^{-3} µg/ng

Acceptance criteria: 0.5 ppm (µg/g)

• **LIMIT OF SULFUR DIOXIDE**

Starch indicator solution: Mix 10 g of soluble starch with 50 mL of cold water, transfer to 1000 mL of boiling water, stir until completely dissolved, cool, and add 1 g of salicylic acid preservative. [NOTE—Discard this solution after 1 month.]

Sample: 100 g

Blank: 200 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.005 N iodine VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 250-mL conical flask, add 100 mL of water, and mix. Cool to 5°–10°. While stirring with a magnetic stirrer, add 10 mL of cold (5°–10°) 1.5 N sodium hydroxide. Stir for an additional 20 s, and add 10 mL of *Starch indicator solution*. Add 10 mL of cold (5°–10°) 2.0 N sulfuric acid, and titrate immediately with *Titrant* until a light blue color persists for 1 min. Perform a blank determination, and make any necessary correction.

Calculate the concentration, in ppm (µg/g), of sulfur dioxide (SO₂) in the *Sample* taken:

$$\text{Result} = [(V_S - V_B) \times N \times F_1/W] \times F_2$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F_1 = equivalency factor, 32.0 mg/mEq

W = *Sample* weight (g)

F_2 = conversion factor, 10^3 µg/mg

Acceptance criteria: NMT 40 ppm (µg/g)

• **ABSENCE OF SOLUBLE STARCH**

Analysis: Dissolve 1 g in 10 mL of water, and add 1 drop of iodine TS.

Acceptance criteria: A yellow color indicates the absence of soluble starch.

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR**

SPECIFIED MICROORGANISMS (62): The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeast count does not exceed 10^2 cfu/g.

• **TOTAL SOLIDS**

Instrumental conditions

(See *Refractive Index* (831).)

Mode: Refractometer equipped with a jacket for water circulation or some other mechanism for maintaining the sample at $20 \pm 0.1^\circ$ or $45 \pm 0.1^\circ$

Before proceeding with measurements, ensure that the sample and the prism have reached the equilibrium temperature and that the instrument has been properly checked and calibrated against a standard provided by the manufacturer.

Analysis: Measure the refractive index of Corn Syrup, and convert the value to approximate percent solids value using *Table 2* and *Table 3*. [NOTE—*Table 2* covers the approximate total solids levels of these products in commerce. If the ash or dextrose equivalent of the sample differs from that of the product in *Table 2*, use *Table 3* for the ash and dextrose equivalent correction.]

Table 2. Reference for Converting the Refractive Index to Approximate Percent Solids

Acceptance criteria: The total solids value is NLT 70.0%.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.
- **LABELING:** Label it to indicate its nominal dextrose equivalent. Label it also to indicate the presence of sulfur dioxide if the residual concentration is greater than 10 ppm (µg/g).
- **USP REFERENCE STANDARDS** <11>
USP Dextrose RS

High Fructose Corn Syrup**DEFINITION**

High Fructose Corn Syrup is a sweet, nutritive saccharide mixture prepared as a clear, aqueous solution from high-dextrose-equivalent corn starch hydrolysate by the partial enzymatic conversion of dextrose to fructose, using an insoluble glucose isomerase enzyme preparation that complies with 21 CFR 184.1372. It is available in two types, 42% and 55%, based on fructose content. High Fructose Corn Syrup 42% contains NLT 97.0% of total saccharides, expressed as a percentage of total solids, of which NLT 92.0% consists of monosaccharides (fructose and dextrose), including NLT 41.5% and NMT 44.8% of fructose, and NMT 8.0% consists of other saccharides. High Fructose Corn Syrup 55% contains NLT 95.0% of total saccharides, expressed as a percentage of total solids, of which NLT 95.0% consists of monosaccharides (fructose and

dextrose), including NLT 54.5% and NMT 56.5% of fructose, and NMT 5.0% consists of other saccharides.

IDENTIFICATION

• A.

Analysis: Add a few drops of a solution (1 in 10) of Syrup to 5 mL of hot, alkaline cupric tartrate TS.

Acceptance criteria: A copious, red precipitate of cuprous oxide is formed (distinction from sucrose).

ASSAY

• PROCEDURE

Mobile phase: Water

Standard solution: Prepare a solution in water containing a total of 10% saccharide solids of USP Dextrose RS, USP Fructose RS, and USP Maltose Monohydrate RS, in which the USP Dextrose RS and USP Fructose RS percentage concentrations are in the same ratio as those in the *Sample solution*, based on the labeled nominal fructose percentage for the Syrup under test.

Calculate the percentage of USP Maltose Monohydrate RS:

$$\text{Result} = 100 - (F + D)$$

F = labeled nominal fructose percentage for the Syrup under test

D = difference between the specified minimum percentage concentration of total monosaccharides for the Syrup and *F*

Sample solution: Dilute a known weight of Syrup, determined from the results of the test for *Total Solids* and on the nominal total saccharides content, with water to a total saccharides concentration of 10% (w/v), and mix.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm × 30-cm; packing L19

Temperature

Detector: 45°

Column: 85°

Flow rate: 0.6 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for maltose, dextrose, and fructose are about 0.83, 1.0, and 1.32, respectively.]

Suitability requirements

Resolution: NLT 1.2 between maltose and dextrose

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of fructose and of dextrose in the portion of Syrup taken:

$$\text{Result} = (r_U/r_S) \times C_S \times \{V_A/[W_S \times (0.01 \times S_1) \times (0.01 \times S_2)]\} \times 100$$

r_U = peak area of fructose or dextrose from the *Sample solution*

r_S = peak area of fructose or dextrose from the *Standard solution*

C_S = concentration of USP Fructose RS or USP Dextrose RS in the *Standard solution* (mg/mL)

V_A = volume of the *Sample solution* (mL)

W_S = weight of Syrup taken to prepare the *Sample solution* (mg)

S₁ = percentage of total saccharides in the Syrup as specified on the label

S₂ = percentage of total solids in the Syrup as determined in the test for *Total Solids*

Calculate the percentage of other saccharides, expressed in terms of maltose, in the portion of Syrup taken:

$$\text{Result} = (r_U/r_S) \times C_S \times \{V_A/[W_S \times (0.01 \times S_1) \times (0.01 \times S_2)]\} \times 100$$

r_U = sum of all peak areas from the *Sample solution*, except those of fructose and dextrose

r_S = peak area of maltose from the *Standard solution*

C_S = concentration of USP Maltose Monohydrate RS in the *Standard solution* (mg/mL)

V_A = volume of the *Sample solution* (mL)

W_S = weight of Syrup taken to prepare the *Sample solution* (mg)

S₁ = percentage of total saccharides in the Syrup as specified on the label

S₂ = percentage of total solids in the Syrup as determined in the test for *Total Solids*

Acceptance criteria

For High Fructose Corn Syrup 42%

Total saccharides: NLT 97.0%, expressed as a percentage of total solids. Total saccharides contain monosaccharides and other saccharides as follows.

Monosaccharides: NLT 92.0% (fructose and dextrose)

Fructose: 41.5%–44.8%

Other saccharides: NMT 8.0%

For High Fructose Corn Syrup 55%

Total saccharides: NLT 95.0%, expressed as a percentage of total solids. Total saccharides contain monosaccharides and other saccharides as follows.

Monosaccharides: NLT 95.0% (fructose and dextrose)

Fructose: 54.5%–56.5%

Other saccharides: NMT 5.0%

IMPURITIES

• **RESIDUE ON IGNITION** <281>: NMT 0.05%

• **HEAVY METALS**, *Method II* <231>: NMT 5 ppm, using an ignition temperature of 500°

• LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. For digestion, use acid-cleaned, high-density polyethylene, polypropylene, polytet, or quartz tubes. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in borosilicate glass containers. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 min and rinsing with deionized water. Store final diluted solutions in acid-cleaned plastic or polytet tubes or bottles.]

Modifier solution: 200 mg/mL of magnesium nitrate. Just before use, transfer 1.0 mL of this solution to a 10-mL volumetric flask, and dilute with 5% nitric acid to volume.

Standard stock solution: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* <231>, to a 100-mL volumetric flask, add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, dilute with 5% nitric acid to volume, and mix. This solution contains 0.1 µg/mL of lead.

Standard solutions: Transfer portions of *Standard stock solution* to four suitable containers, and dilute with 5% nitric acid to obtain *Standard solutions* having lead concentrations of 100, 50, 25, and 10 ng/mL, respectively.

Sample solution: [NOTE—Perform this procedure in a fume hood.] Transfer 1.5 g of Syrup to two digestion tubes, labeled “Sample solution” and “Temperature monitor solution”, and add 0.75 mL of nitric acid to

each tube. Warm both solutions slowly to 90°–95° to avoid spattering. Heat until all brown vapors have dissipated and any rust-colored tint is gone from the tube labeled "Sample solution" (20–30 min). Cool, add 0.5 mL of 50% hydrogen peroxide dropwise to both solutions, heat to 90°–95° for 5 min, and cool. Add a second 0.5-mL portion of 50% hydrogen peroxide dropwise to each solution, and heat to 90°–100° for 5–10 min until the tube labeled "Sample solution" is clear. Cool, and transfer the *Sample solution* to a 10-mL volumetric flask. Rinse the tube labeled "Sample solution" with 5% nitric acid, add the rinsing to the volumetric flask, dilute with 5% nitric acid to volume, and mix.

Standard blank: 5% nitric acid

Sample blank: Transfer 1.5 g of water to a digestion tube, and proceed as directed for the *Sample solution*, beginning with "add 0.75 mL of nitric acid".

Instrumental conditions

Mode: Graphite furnace atomic absorption with pyrolytically coated graphite tubes and adequate means of background correction

Lamp: A lead hollow-cathode

Analytical wavelength: Lead emission line of 283.3 nm

Furnace program: See Table 1. [NOTE—The temperature program may be modified to obtain optimum furnace temperatures.]

Table 1

Step	Dry	Ash	Purge	Atomize
Temperature (°)	200	750	Cool down, and purge the air from the furnace 20	1800
Ramp time (s)	20	40	—	0
Hold time (s)	30	40	60	10
Argon flow rate (mL/min)	300	300	300	Argon gas flow stopped

Injection volume: 20 µL

Analysis

[NOTE—Use peak area measurements for all quantitations.]

Samples: Add 5 µL of the *Modifier solution* to 20 µL each of the *Standard solutions*, the *Sample solution*, the *Standard blank*, and the *Sample blank*, and mix.

Separately inject equal volumes (about 20 µL) of the *Samples* into the instrument for analysis.

Using the *Standard blank* to set the instrument to zero, determine the integrated absorbances of the *Standard solutions*. Plot the integrated absorbances of the *Standard solutions* versus their contents of lead, in ng/mL, and draw the line best fitting the four points to determine the calibration curve. Similarly determine the integrated absorbances of the *Sample solution* and the *Sample blank*. Correct the absorbance value of the *Sample solution* by subtracting from it the absorbance value obtained from the *Sample blank*.

Calculate the concentration of lead, in ppm (µg/g), in the portion of Syrup taken:

$$\text{Result} = (V \times C_L / W) \times F$$

V = volume of the *Sample solution*, 10 mL

C_L = concentration of lead in the *Sample solution*, as determined from the calibration curve (ng/mL)

W = weight of Syrup taken to prepare the *Sample solution* (g)

F = conversion factor, 10^{-3} µg/ng

Acceptance criteria: NMT 0.1 ppm (µg/g)

• LIMIT OF SULFUR DIOXIDE

Starch indicator solution: Mix 10 g of soluble starch with 50 mL of cold water. Transfer to 1000 mL of boiling water, stir until completely dissolved, cool, and add 1 g of salicylic acid preservative. [NOTE—Discard the solution after 1 month.]

Sample: 100 g

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.005 N iodine VS

Blank: 200 mL of water

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 250-mL conical flask, add 100 mL of water, and mix. Cool to 5°–10°. While stirring with a magnetic stirrer, add 10 mL of cold (5°–10°) 1.5 N sodium hydroxide. Stir for an additional 20 s, and add 10 mL of *Starch indicator solution*. Add 10 mL of cold (5°–10°) 2.0 N sulfuric acid, and titrate immediately with *Titrant* until a light blue color persists for 1 min. Perform a blank determination, and make any necessary correction.

Calculate the concentration, in ppm (µg/g), of sulfur dioxide (SO₂) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F_1] / W\} \times F_2$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F_1 = equivalency factor, 32.0 mg/mEq

W = *Sample* weight (g)

F_2 = conversion factor, 10^3 µg/mg

Acceptance criteria: NMT 30 ppm

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeast count does not exceed 10^2 cfu/g.
- **TOTAL SOLIDS:** Determine the refractive index of the Syrup at 20° or 45° (see *Refractive Index* (831)). Use Table 2 for calculating the percentage of dry substance (percentage of total solids on a weight/weight basis).

Table 2

Fructose Content (%)	Dry Substance (DS) (%)	Refractive Index at 20°	Refractive Index at 45°
42	70.5	1.4632	1.4577
—	71.0	1.4643	1.4589
—	72.0	1.4667	1.4612
—	73.0	1.4691	1.4635
55	76.5	1.4774	1.4716
—	77.0	1.4786	1.4728
—	78.0	1.4811	1.4752
—	79.0	1.4835	1.4776

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirement specified.
- **LABELING:** Label it to state, as part of the official title, the nominal percentage of fructose, based on the specified minimum percentage concentration of total saccharides. Label it to indicate the presence of sulfur dioxide if the residual concentration is greater than 10 ppm (µg/g).

USP Dextrose RS
USP Fructose RS
USP Maltose Monohydrate RS

Corn Syrup Solids

DEFINITION

Corn Syrup Solids (Dried Glucose Syrup) is a dried mixture of saccharides obtained by partial hydrolysis of edible corn starch by food grade acids and/or enzymes. It contains NLT 20.0% reducing sugar content (dextrose equivalent) expressed as D-glucose, calculated on the dried basis.

IDENTIFICATION

- **A.**
Sample solution: 50 mg/mL
Analysis: Add a few drops of the *Sample solution* to 5 mL of hot, alkaline cupric tartrate TS.
Acceptance criteria: A copious, red precipitate of cuprous oxide is formed (distinction from sucrose).

ASSAY

• REDUCING SUGARS (DEXTROSE EQUIVALENT)

Apparatus: Mount a ring support on a ring stand 1–2 inches above a gas burner, and mount a second ring 6–7 inches above the first. Place 6-inch open-wire gauze on the lower ring to support a 250-mL conical flask, and place a 4-inch watch glass with a center hole on the upper ring to deflect heat. Attach a 25-mL buret to the ring stand so that the tip just passes through the watch glass centered above the flask. Place an indirectly lighted white surface behind the assembly for observing the endpoint.

Standard solution: 6 mg/mL of USP Dextrose RS

Sample solution: Transfer 4 g of Corn Syrup Solids to a 500-mL volumetric flask, and dilute with water to volume.

Analysis: Transfer 25.0-mL portions of alkaline cupric tartrate TS to each of two flasks, and boil. Immediately place one flask on the wire gauze of the *Apparatus*, and adjust the burner so that the boiling point will be reached in 2 min. Titrate with the *Standard solution* to within 0.5 mL of the anticipated endpoint. Heat the flask with swirling, boil moderately for 2 min, and add 2 drops of a 10-mg/mL methylene blue solution. Immediately add 2 drops of the *Standard solution* from the buret, and bring to a boil. Allow the cuprous oxide to settle slightly, and observe the color of the supernatant. Complete the titration within 1 min by adding the *Standard solution* dropwise, and boiling after each addition to the disappearance of the blue color, as determined by viewing against a white background in daylight or under equivalent illumination. If more than 0.5 mL of the titrant is required after the addition of the indicator, repeat the titration, adding the necessary volume of titrant before adding the indicator. Bring the contents of the second flask to a boil, and similarly titrate with the *Sample solution*.

Calculate the percentage of reducing sugars as D-glucose, calculated on the dried basis, in the portion of Corn Syrup Solids taken:

$$\text{Result} = (C_S/C_U) \times (V_S/V_U) \times [1/(0.01 \times A)] \times 100$$

- C_S = concentration of USP Dextrose RS in the *Standard solution* (mg/mL)
 C_U = concentration of Corn Syrup Solids taken to prepare the *Sample solution* (mg/mL)
 V_S = titrated volumes of the *Standard solution* (mL)

- V_U = titrated volumes of the *Sample solution* (mL)
 A = percentage of dry solids in Corn Syrup Solids, as determined in the test for *Total Solids*

Acceptance criteria: NLT 20.0% reducing sugar content (dextrose equivalent) expressed as D-glucose on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%
- **HEAVY METALS**, *Method II* (231): NMT 5 µg/g, using an ignition temperature of 500°

• LIMIT OF SULFUR DIOXIDE

Starch indicator solution: Mix 10 g of soluble starch with 50 mL of cold water. Transfer to 1000 mL of boiling water, and stir until completely dissolved. Cool, and add 1 g of salicylic acid preservative. [NOTE—Discard the solution after 1 month.]

Sample: 78 g

Blank: 200 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.005 N iodine VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 250-mL conical flask. Dilute with 122 mL of water, and mix to dissolve. Cool to 5°–10°. While stirring with a magnetic stirrer, add 10 mL of cold 1.5 N sodium hydroxide (5°–10°). Stir for an additional 20 s, and add 10 mL of *Starch indicator solution*. Add 10 mL of cold 2.0 N sulfuric acid (5°–10°), and titrate immediately with *Titrant* until a light blue color persists for 1 min. Perform a blank determination, and make any necessary correction.

Calculate the amount of sulfur dioxide (SO₂) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F_1] \times F_2\} / W$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F_1 = equivalency factor, 32.0 mg/mEq

F_2 = conversion factor, 10³ µg/mg

W = *Sample* weight (g)

Acceptance criteria: NMT 40 µg/g

• LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. For digestion, use acid-cleaned, high-density polyethylene, polypropylene, polytetrafluoroethylene, or quartz tubes. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in borosilicate glass containers. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 min and rinsing with deionized water. Store final diluted solutions in acid-cleaned plastic or polytetrafluoroethylene tubes or bottles.]

Modifier solution: 200 mg/mL of magnesium nitrate. Just before use, transfer 1.0 mL of this solution to a 10-mL volumetric flask, and dilute with 5% nitric acid to volume.

Standard solutions: Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* (231), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with 5% nitric acid to volume. This solution contains 0.1 µg/mL of lead. Transfer portions of this solution to four suitable containers, and dilute with 5% nitric acid to obtain *Standard solutions* having lead concentrations of 100, 50, 25, and 10 µg/mL.

Sample solution

[NOTE—Perform this procedure in a fume hood.]

Transfer 1.2 g of Corn Syrup Solids to two digestion tubes labeled sample solution and temperature monitor solution, and add 0.75 mL of nitric acid to each tube. Warm both solutions slowly to 90°–95° to avoid spattering. Heat until all brown vapors have dissipated and any rust-colored tint is gone from the tube labeled *Sample solution* (20–30 min). Cool, then add 0.5 mL of 50% hydrogen peroxide dropwise to both solutions, and heat to between 90° and 95° for 5 min. Cool, then add a second 0.5-mL portion of 50% hydrogen peroxide dropwise to each solution, and heat to 90°–100° until clear (5–10 min). Cool, and transfer the solution labeled *Sample solution* to a 10-mL volumetric flask. Rinse the *Sample solution* digestion tube with 5% nitric acid, add the rinse to the volumetric flask, and dilute with 5% nitric acid to volume.

Standard blank: 5% nitric acid

Sample blank: Transfer 1.5 g of water to a digestion tube, and proceed as directed for the *Sample solution*, beginning with “add 0.75 mL of nitric acid”.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with pyrolytically coated graphite tubes and adequate means of background correction

Analytical wavelength: 283.3 nm

Injection volume: 20 µL

Temperature: Maintain the drying temperature of the furnace at 200° for 30 s after a 20-s ramp time using an argon gas flow of 300 mL/min. Maintain the ashing temperature at 750° for 40 s after a 40-s ramp time using an airflow of about 300 mL/min. Cool down, and purge the air from the furnace for 60 s using a 20° set temperature and an argon gas flow of about 300 mL/min. Maintain the atomization temperature at 1800° for 10 s after a 0-s ramp time with the argon gas flow stopped. [NOTE—The temperature program may be modified to obtain optimum furnace temperatures.]

Analysis

Samples: *Standard solutions*, *Sample solution*, *Standard blank*, *Sample blank*

Add 5 µL of the *Modifier solution* to 20 µL each of the *Standard solutions*, the *Sample solution*, the *Standard blank*, and the *Sample blank*, and mix. Separately inject each into the atomic absorption spectrophotometer.

Using the *Standard blank* to set the instrument to zero, determine the integrated absorbances of the *Standard solutions*. Plot the integrated absorbances of the *Standard solutions* versus their contents of lead, and draw the line best fitting the four points to determine the calibration curve. Similarly, determine the integrated absorbances of the *Sample solution* and the *Sample blank*. Correct the absorbance value of the *Sample solution* with the *Sample blank*.

Calculate the concentration of lead in the portion of Corn Syrup Solids taken:

$$\text{Result} = (V \times C/W) \times F$$

V = volume of the *Sample solution*, 10 mL

C = concentration of lead in the *Sample solution*, as determined from the calibration curve (ng/mL)

W = weight of Corn Syrup Solids taken to prepare the *Sample solution* (g)

F = conversion factor, 10⁻³ µg/ng

Acceptance criteria: NMT 0.5 µg/g

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10³ cfu/g, and the total

combined yeasts and molds count does not exceed 10² cfu/g.

- **STARCH**

Sample solution: 100 mg/mL

Analysis: Add 1 drop of iodine TS to 10 mL of the *Sample solution*.

Acceptance criteria: A yellow color indicates the absence of soluble starch.

- **TOTAL SOLIDS**

Analysis: To determine the water content, proceed as directed in *Water Determination* (921), *Method 1a*, except use a weighed amount of Corn Syrup Solids, W_U , for the *Test Preparation*. In *Standardization of the Reagent*, proceed as directed, except use the formula for significant amounts of water (1% or more). [NOTE—Pure methanol can make the detector overly sensitive, particularly at low ppm levels of water, causing it to deflect to dryness and slowly recover with each addition of reagent. This slows down the titration and may allow the system to actually pick up ambient moisture during the resulting long titration. Adding chloroform or a similar nonconducting solvent will retard this sensitivity and can improve the analysis.] In the *Procedure* calculating the water content in the *Test Preparation*, use $W_W = S \times F$.

Calculate the percentage of total solids in the portion of the *Test Preparation* taken:

$$\text{Result} = (W_U - W_W)/W_U \times 100$$

W_U = weight of Corn Syrup Solids for the *Test Preparation* (mg)

W_W = weight of water determined (mg)

Acceptance criteria: NLT 90.0% when the reducing sugar content is NLT 88.0%; NLT 93.0% when the reducing sugar content is 20.0%–88.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tightly closed containers, and store in a cool, dry place.
- **LABELING:** Label it to indicate its nominal dextrose equivalent. Label it also to indicate the presence of sulfur dioxide if the residual concentration is greater than 10 µg/g.
- **USP REFERENCE STANDARDS** (11)
USP Dextrose RS

Cottonseed Oil

[8001-29-4].

DEFINITION

Cottonseed Oil is the refined fixed oil obtained from the seed of cultivated plants of various varieties of *Gossypium hirsutum* Linné or of other species of *Gossypium* (Fam. Malvaceae). It may contain suitable antioxidants.

IDENTIFICATION

- **A.** Cottonseed Oil exhibits the composition profile of fatty acids, as determined in the general test chapter *Fats and Fixed Oils* (401), *Fatty Acid Composition*. See *Table 1*.

Table 1

Carbon-Chain Length	No. of Double Bonds	Percentage (%)
<14	0 or 1	≤0.2
14	0	0.3–1.0
16	0	18.0–26.4
16	1	≤1.2
18	0	2.1–3.3

Table 1 (Continued)

Carbon-Chain Length	No. of Double Bonds	Percentage (%)
18	1	14.0–21.7
18	2	46.7–58.3
18	3	≤1.0
20	0	≤1.0
20	1	≤0.5
22	0	≤0.6
22	1	≤0.5
24	0	≤0.5

IMPURITIES• **ALKALINE IMPURITIES**

Sample: 10 mL of Cottonseed Oil

Analysis: Mix 10 mL of acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. If necessary, neutralize the solution to a green color with 0.01 N hydrochloric acid or 0.01 N sodium hydroxide. Add the *Sample*, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow.

Acceptance criteria: NMT 0.1 mL of 0.01 N hydrochloric acid is required.

• **HEAVY METALS, Method II <231>:** NMT 10 ppm**SPECIFIC TESTS**

- **FATS AND FIXED OILS, Acid Value <401>:** NMT 0.2
- **FATS AND FIXED OILS, Peroxide Value <401>:** NMT 10.0
- **FATS AND FIXED OILS, Unsaponifiable Matter <401>:** NMT 1.5%
- **WATER DETERMINATION, Method Ic <921>:** NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.
- **LABELING:** Label it to indicate the name and quantity of any added antioxidants. Where Cottonseed Oil is intended for use in the manufacture of injectable dosage forms, it is so labeled.
- **OTHER REQUIREMENTS:** For Cottonseed Oil intended for use in injectable dosage forms, which is specified in the *Labeling* section, the requirements in the subsection *Other Vehicles* in the section *Ingredients under Injections* <1> must be met.

Hydrogenated Cottonseed Oil**DEFINITION**

Hydrogenated Cottonseed Oil is the product obtained by refining and hydrogenating oil obtained from seeds of cultivated plants of various varieties of *Gossypium hirsutum* L. or of other species of *Gossypium* (Fam. Malvaceae). The product consists mainly of triglycerides of palmitic and stearic acids.

IDENTIFICATION

- **A.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* <401>.
- **B.** It meets the requirements in *Specific Tests for Melting Range or Temperature, Class II* <741>.

IMPURITIES• **LIMIT OF NICKEL**

Solution A: Immediately before use, dilute 10 mL of nickel standard solution TS with water to 500 mL. This solution contains the equivalent of 0.2 µg/g of nickel.

Sample solution: Weigh 5.0 g of Hydrogenated Cottonseed Oil into a previously tared platinum or silica crucible. Cautiously heat, and introduce into the sub-

stance a wick formed from twisted ashless filter paper. Ignite the wick. When the substance ignites, stop heating. After combustion, ignite in a muffle furnace at 600°. Continue the incineration until white ash is obtained. After cooling, transfer the residue, with the aid of two 2-mL portions of diluted hydrochloric acid, to a 25-mL volumetric flask, add 0.3 mL of nitric acid, and dilute with water to volume.

Standard solutions: Into three identical 10-mL volumetric flasks, introduce respectively 1.0, 2.0, and 4.0 mL of *Solution A*. To each flask add a 2.0-mL portion of the *Sample solution*, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry, equipped with a graphite furnace

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Analysis: Concomitantly determine the absorbances of the *Sample solution* and each of the *Standard solutions* at least three times each, and record the average of the steady readings. Plot the absorbances of the *Sample solution* and the *Standard solutions* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution*.

Acceptance criteria: NMT 1 µg/g

• **ALKALINE IMPURITIES**

Sample solution: Dissolve by gentle heating 2.0 g of Hydrogenated Cottonseed Oil in a mixture of 1.5 mL of alcohol and 3.0 mL of toluene.

Analysis: To the *Sample solution* add 0.05 mL of bromophenol blue TS, and titrate with 0.01 N hydrochloric acid to a yellow endpoint.

Acceptance criteria: NMT 0.4 mL of 0.01 N hydrochloric acid is required.

SPECIFIC TESTS

- **FATS AND FIXED OILS, Fatty Acid Composition <401>:** Hydrogenated Cottonseed Oil exhibits the composition profile of fatty acids in *Table 1*, as determined in the chapter.

Table 1

Carbon-Chain Length	No. of Double Bonds	Percentage (%)
<14	0	≤0.2
14	0	≤1.0
16	0	19–26
18	0	68–80
20	0	≤1.0
22	0	≤1.0
24	0	≤0.5
18	1	≤4.0
18	2	≤1.0

- **MELTING RANGE OR TEMPERATURE, Class II <741>:** 57°–70°

- **FATS AND FIXED OILS, Acid Value (Free Fatty Acids) <401>**

Sample: 10 g

Analysis: Dissolve the *Sample* in 50 mL of a hot mixture of neutralized alcohol and toluene (1:1), add 0.5 mL of phenolphthalein TS, and titrate with 0.1 N potassium hydroxide VS to produce a permanent, faint pink color.

Acceptance criteria: NMT 0.5

- **FATS AND FIXED OILS, Peroxide Value <401>:** NMT 5.0

- **FATS AND FIXED OILS, Unsaponifiable Matter <401>:** NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No storage requirements are specified.

Creatinine

C₄H₇N₃O

113.12

DEFINITION

Creatinine contains NLT 98.5% and NMT 102.0% of C₄H₇N₃O, as Creatinine, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

ASSAY

• PROCEDURE

Sample: 40 mg of Creatinine

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Indicator electrode: Glass

Reference electrode: Silver–silver chloride

Reference electrode solution: Saturated lithium perchlorate and silver chloride in glacial acetic acid

Analysis: Dissolve the *Sample* in 10 mL of glacial acetic acid. Titrate the *Sample* with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction.

Calculate the percentage of creatinine (C₄H₇N₃O) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = volume of the *Titrant* consumed by the *Sample* (mL)

B = volume of the *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 113.12 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 98.5%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%
- **HEAVY METALS**, *Method I* (231): 10 ppm

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 3.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Creatinine RS

Cresol

C₇H₈O

Phenol, methyl-;
Cresol [1319-77-3].

108.14

DEFINITION

Cresol is a mixture of isomeric cresols obtained from coal tar or from petroleum.

IDENTIFICATION

• A.

Sample solution: A saturated solution

Analysis: To the *Sample solution* add a few drops of ferric chloride TS.

Acceptance criteria: A bluish-violet color is produced.

IMPURITIES

• LIMIT OF PHENOL

Solution A: Bubble air through nitric acid until the acid is colorless, then mix 1 volume of the acid with 4 volumes of water.

Standard solution: Dissolve 1 g of phenol in 100 mL of water, and determine the actual C₆H₆O concentration as follows. Pipet 4 mL of the solution into an iodine flask, add 30.0 mL of 0.1 N bromine VS, then add 5 mL of hydrochloric acid, and immediately insert the stopper. Shake the flask repeatedly for 30 min, and allow to stand for 15 min. Add quickly 5 mL of a 200-mg/mL potassium iodide solution, taking precautions to prevent the escape of bromine vapor, and at once insert the stopper into the flask. Shake thoroughly, remove the stopper, and rinse it and the neck of the flask with a small quantity of water so that the washings flow into the flask. Add 1 mL of chloroform, shake the mixture, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination. Each mL of 0.1 N bromine is equivalent to 1.569 mg of C₆H₆O. Dilute a suitable volume of the solution with water to obtain a concentration of 250 µg/mL of C₆H₆O.

Sample solution: Place 2.5 g of Cresol in a 250-mL volumetric flask, add 10 mL of sodium hydroxide solution (100 mg/mL), and dilute with water to volume. Pipet 5 mL of this solution into a 200-mL volumetric flask, add 45 mL of water and 1 drop of methyl orange TS, neutralize with *Solution A* added dropwise, and then dilute with water to volume.

Analysis: Pipet 5.0 mL of the neutralized *Sample solution* into each of two 20- × 180-mm test tubes, graduated at the 25-mL mark, and pipet 5.0 mL of the *Standard solution* into each of two similar test tubes. To the contents of each tube add 5 mL of Millon's Reagent, allowing it to flow down the inner wall of the tube. Place the tubes simultaneously in a boiling water bath provided with a rack so that the tubes do not touch the bottom of the bath, and maintain the bath at boiling temperature for 30 min, accurately timed. At once remove the tubes from the bath, cool them immediately and thoroughly by placing them in a bath of cold water for NLT 10 min, and add 5 mL of *Solution A* to each tube. Add 3 mL of a 2% formaldehyde solution to one of each pair of tubes, add water to fill all tubes to volume, shake thoroughly, and allow to stand for 16 h, during which time the added formaldehyde imparts a yellow color while the contents of the other two tubes acquire an orange-red color.

Pipet 20 mL from each of the two tubes containing the *Standard solution* into separate 100-mL volumetric flasks, add 5 mL of *Solution A*, and then add water to volume. Transfer the solutions to burets marked *B1* and *B2*, representing, respectively, the solution not treated and the solution treated with formaldehyde.

Pipet 10 mL from each of the two tubes containing the *Sample solution* into separate 50-mL color-comparison tubes marked *N1* and *N2*, representing, respectively, the solution treated with formaldehyde and the solution not treated with formaldehyde.

Add to tube *N1* the orange-red colored solution from buret *B1*, and add to tube *N2* an equal volume of the yellow-colored solution from buret *B2*, until the colors in tubes *N1* and *N2* match when observed in a colorimeter.

Calculate the percentage of phenol (C_6H_6O) in the portion of the sample taken:

$$\text{Result} = V/W \times 5$$

V = volume of the *Standard solution* taken from buret *B1* (mL)

W = weight of Cresol taken (g)

Acceptance criteria: NMT 5.0%

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 1.030–1.038
- **DISTILLING RANGE, Method II** (721): NLT 90% distills between 195° and 205°.
- **HYDROCARBONS**

Sample solution: 1 in 60

Standard solution: To 58 mL of water add 1.5 mL of 0.02 N sulfuric acid and 1 mL of barium chloride solution (100 mg/mL).

Analysis: Compare the turbidity of the *Sample solution* against the *Standard solution* after the *Standard solution* has been shaken and allowed to stand for 5 min.

Acceptance criteria: The *Sample solution* shows no more turbidity than the *Standard solution*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Croscarmellose Sodium

DEFINITION

Croscarmellose Sodium is the sodium salt of a cross-linked, partly *O*-(carboxymethylated) cellulose.

IDENTIFICATION

- **A.** Mix 1 g with 100 mL of methylene blue solution (1 in 250,000), stir the mixture, and allow it to settle. The Croscarmellose Sodium absorbs the methylene blue and settles as a blue, fibrous mass.
- **B.** Mix 1 g with 50 mL of water. Transfer 1 mL of the mixture to a small test tube, and add 1 mL of water and 5 drops of 1-naphthol TS. Incline the test tube, and carefully add 2 mL of sulfuric acid down the side so that it forms a lower layer: a reddish-violet color develops at the interface.
- **C.** A portion of the mixture of Croscarmellose Sodium with water, prepared as directed in *Identification test B*, meets the requirements of the flame test for *Identification Tests—General* (191), *Sodium*.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): 14.0%–28.0%, calculated on the dried basis. Use 1.0 g for the test, and use sufficient sulfuric acid to moisten the entire residue after the initial charring step, and additional sulfuric acid if an excessive amount of carbonaceous material remains after the initial complete volatilization of white fumes.
- **HEAVY METALS, Method II** (231): 10 ppm
- **SODIUM CHLORIDE** and **SODIUM GLYCOLATE**

Sodium chloride

Sample: 5 g of Croscarmellose Sodium

Analysis: Transfer the *Sample* to a 250-mL beaker.

Add 50 mL of water and 5 mL of 30% hydrogen peroxide, and heat on a steam bath for 20 min, stirring occasionally to ensure hydration. Cool, and add 100 mL of water and 10 mL of nitric acid. Titrate with 0.05 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-based indicator electrode and a double-junction reference electrode containing 10% potassium nitrate filling solution in the outer jacket and a standard filling solution in the in-

ner jacket, and stirring constantly (see *Titrimetry* (541)).

Calculate the percentage of sodium chloride in the specimen taken:

$$\text{Result} = (F \times V \times N)/[(100 - b) \times W]$$

F = equivalence factor for sodium chloride, 584.4

V = volume of the silver nitrate (mL)

N = normality of the silver nitrate

b = percentage of *Loss on Drying*, determined separately

W = weight of the specimen (g)

Sodium glycolate

Sample solution: Transfer 500 mg to a 100-mL beaker. Moisten thoroughly with 5 mL of glacial acetic acid, followed by 5 mL of water, and stir with a glass rod to ensure proper hydration (usually about 15 min). Slowly add 50 mL of acetone while stirring, then add 1 g of sodium chloride, and stir for several min to ensure complete precipitation of the carboxymethylcellulose. Filter through a soft, open-textured paper, previously wetted with a small amount of acetone, and collect the filtrate in a 100-mL volumetric flask. Use an additional 30 mL of acetone to facilitate the transfer of the solids and to wash the filter cake, then dilute with acetone to volume, and mix.

Standard stock solution: Transfer 100 mg of glycolic acid, previously dried in a desiccator at room temperature overnight, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

[NOTE—Use this solution within 30 days.]

Standard solution A: Transfer 1.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, then add 5 mL of glacial acetic acid. Dilute with acetone to volume, and mix.

Standard solution B: Transfer 2.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, then add 5 mL of glacial acetic acid. Dilute with acetone to volume, and mix.

Standard solution C: Transfer 3.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, then add 5 mL of glacial acetic acid. Dilute with acetone to volume, and mix.

Standard solution D: Transfer 4.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, then add 5 mL of glacial acetic acid. Dilute with acetone to volume, and mix.

Analysis

Samples: *Sample solution*, *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Standard solution D*

Transfer 2.0 mL of the *Sample solution* and 2.0 mL of each *Standard solution* to separate 25-mL volumetric flasks, and prepare a blank flask containing 2.0 mL of a solution containing 5% each of glacial acetic acid and water in acetone. Place the uncovered flasks in a boiling water bath for 20 min to remove the acetone. Remove from the bath, and cool. Add to each flask 5.0 mL of 2,7-dihydroxynaphthalene TS, mix, add an additional 15 mL, and again mix. Cover the mouth of each flask with a small piece of aluminum foil. Place the flasks upright in a boiling water bath for 20 min, then remove from the bath, cool, dilute with sulfuric acid to volume, and mix.

Determine the absorbance of each solution at 540 nm, with a suitable spectrophotometer, against the blank, and prepare a standard curve using the absorbances obtained from the *Standard solutions*. Calculate the percentage of sodium glycolate in the specimen taken:

$$\text{Result} = (F \times W_1)/[(100 - b) \times W_2]$$

- F = factor converting glycolic acid to sodium glycolate, 12.9
 W_1 = weight of glycolic acid in the specimen (mg), determined from the standard curve and the absorbance of the *Sample solution*
 b = percentage of *Loss on Drying*, determined separately
 W_2 = weight of the specimen taken (g)

Acceptance criteria: The sum of the percentages of sodium chloride and sodium glycolate is NMT 0.5%.

SPECIFIC TESTS

• CONTENT OF WATER-SOLUBLE MATERIAL

Analysis: Disperse 10 g in 800 mL of water, and stir for 1 min every 10 min during the first 30 min. Allow to stand for an additional h, or centrifuge, if necessary. Decant 200 mL of the aqueous slurry onto a rapid-filtering filter paper in a vacuum filtration funnel, apply vacuum, and collect about 150 mL of the filtrate. Pour the filtrate into a tared 250-mL beaker, weigh, and calculate the weight, in g, of the filtrate, W_3 , by difference. Concentrate on a hot plate to a small volume, but not to dryness; dry at 105° for 4 h; again weigh; and calculate the weight, in g, of residue W_1 , by difference.

Calculate the percentage of water-soluble material in the specimen, on the dried basis, taken:

$$\text{Result} = [100 \times W_1 \times (800 + W_2)] / \{W_2 \times W_3 \times [1 - (0.01 \times b)]\}$$

- W_1 = weight of residue by difference (g)
 W_2 = weight of the specimen taken (g)
 W_3 = weight of the filtrate by difference (g)
 b = percentage *Loss on Drying* of the specimen taken

Acceptance criteria: NMT 10.0%

• DEGREE OF SUBSTITUTION

Sample: 1 g

Analysis: Transfer the *Sample* to a glass-stoppered, 500-mL conical flask. Add 300 mL of sodium chloride solution (1 in 10), then add 25.0 mL of 0.1 N sodium hydroxide VS. Insert the stopper, and allow to stand for 5 min with intermittent shaking. Add 5 drops of *m*-cresol purple TS, and from a buret add 15 mL of 0.1 N hydrochloric acid VS. Insert the stopper in the flask, and shake. If the solution is violet, add 0.1 N hydrochloric acid VS in 1-mL portions until the solution becomes yellow, shaking after each addition. Titrate with 0.1 N sodium hydroxide VS to a violet endpoint. Calculate the net number of milliequivalents, M, of base required for the neutralization of 1 g of Croscarmellose Sodium, on the dried basis.

Calculate the degree of acid carboxymethyl substitution, A:

$$\text{Result} = 1150 \times M / [7102 - (412 \times M) - (80 \times C)]$$

- M = milliequivalents
 C = percentage of *Residue on Ignition* of the Croscarmellose Sodium as determined in the test for *Residue on Ignition*

Calculate the degree of sodium carboxymethyl substitution, S:

$$\text{Result} = [162 + (58 \times A)] \times C / [7102 - (80 \times C)]$$

- A = degree of acid carboxymethyl substitution, as determined above
 C = percentage of *Residue on Ignition* of the Croscarmellose Sodium as determined in the test for *Residue on Ignition*

The degree of substitution is the sum of A + S.

Acceptance criteria: The degree of substitution is 0.60–0.85, on the dried basis

- **LOSS ON DRYING** (731): Dry a sample at 105° for 6 h: it loses NMT 10.0% of its weight.
- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g. It meets the requirements of the tests for absence of *Escherichia coli*.
- **pH** (791): The pH of the dispersion is 5.0–7.0. Mix 1 g with 100 mL of water for 5 min.
- **SETTLING VOLUME**
Analysis: To 75 mL of water in a 100-mL graduated cylinder, add 1.5 g of it in 0.5-g portions, shaking vigorously after each addition. Add water to make 100 mL, shake again until all of the powder is homogeneously distributed, and allow to stand for 4 h. Note the volume of the settled mass.
Acceptance criteria: The volume of the settled mass is 10.0–30.0 mL

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

Crospovidone

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

(C_6H_9NO)_n
 1-Ethenyl-2-pyrrolidinone homopolymer;
 1-Vinyl-2-pyrrolidinone homopolymer [9003-39-8].

DEFINITION

Crospovidone is a water-insoluble synthetic cross-linked homopolymer of *N*-vinyl-2-pyrrolidinone. It contains NLT 11.0% and NMT 12.8% of nitrogen (N), calculated on the dried basis. Two types of Crospovidone are available, depending on the particle size: Type A and Type B.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): Previously dried in a vacuum at 105° for 1 h.♦
- **B.**
Sample: 1 g
Analysis: Suspend the *Sample* in 10 mL of water, add 0.1 mL of 0.1 N iodine, and shake for 30 s. Add 1 mL of starch TS, and shake.
Acceptance criteria: No blue color develops.
- **C.** To 10 mL of water add 0.1 g and shake. A suspension is formed, and no clear solution is obtained within 15 min.
- **D.**
Sample: 20 g of the dried substance
Analysis: Clean and dry the analytical sieves used in the analysis by washing the sieves in hot water. Allow to dry overnight in a drying cabinet at 105°. Place the *Sample* in a 1000-mL conical flask, add 500 mL of water, and shake the suspension for 30 min. Pour the suspension through a 63-μm analytical sieve, previously tared, and rinse the sieve with water until the filtrate is clear. Dry the sieve and sample residue at 105° for 5 h in a drying cabinet without circulating air. Cool in a desiccator for 30 min, and weigh.

Calculate the percentage sieving residue fraction of sample particles having a diameter of more than 63 μm :

$$\text{Result} = [(m_1 - m_3) \times 100] / m_2$$

m_1 = mass of the sieve and sample residue, after drying for 5 h (g)

m_3 = mass of the sieve (g)

m_2 = initial mass of the sample, calculated on a dried basis (g)

Acceptance criteria: If the sieving residue fraction is more than 15%, the substance is classified as Type A; if the sieving residue fraction is NMT 15%, the substance is classified as Type B.

ASSAY

• NITROGEN DETERMINATION, Method II (461)

Sample: 0.1 g

Analysis: Proceed as directed, using the *Sample*. In the *Procedure*, omit the use of hydrogen peroxide, and use 5 g of a powdered mixture of potassium sulfate, cupric sulfate, and titanium dioxide (33:1:1), instead of potassium sulfate and cupric sulfate (10:1). Heat until a clear, light green solution is obtained. Heat for an additional 45 min, and proceed as directed for *Procedure*, beginning with "Cautiously add to the digestion mixture 70 mL of water".

Acceptance criteria: 11.0%–12.8% on the dried basis

IMPURITIES

• RESIDUE ON IGNITION (281): NMT 0.1%, determined on 1.0 g

• HEAVY METALS, Method II (231): NMT 10 ppm

• PEROXIDES

Sample suspension A: [NOTE—Use for Type A.] 40 mg/mL in water. To 25 mL of this suspension add 2 mL of titanium trichloride-sulfuric acid TS. Allow to stand for 30 min, and filter.

Sample suspension B: [NOTE—Use for Type B.] 16 mg/mL in water. To 25 mL of this suspension add 2 mL of titanium trichloride-sulfuric acid TS. Allow to stand for 30 min, and filter.

Compensation liquid A: [NOTE—Use for Type A.] 40 mg/mL in water. Filter, take 25 mL, and add 2 mL of a 13% solution of sulfuric acid.

Compensation liquid B: [NOTE—Use for Type B.] 16 mg/mL in water. Filter, take 25 mL, and add 2 mL of a 13% solution of sulfuric acid.

Analysis: Measure the absorbance of the filtrate at 405 nm against the appropriate compensation liquid.

Acceptance criteria: NMT 0.35. For Type A, this corresponds to NMT 400 ppm expressed as H_2O_2 ; for Type B, this corresponds to NMT 1000 ppm expressed as H_2O_2 .

• VINYLPIRROLIDINONE

Mobile phase: Acetonitrile and water (1:9)

Sample solution: 25 mg/mL of suspension in methanol. Shake for 60 min. Leave the bulk to settle, and pass through a filter of 0.2- μm pore size.

Reference stock solution A: 5 μg /mL of vinylpyrrolidinone in methanol

Reference stock solution B: 100 μg /mL of vinylpyrrolidinone and 5 mg/mL of vinyl acetate in methanol

Reference solution A: A 1-in-20 solution of *Reference stock solution A* in *Mobile phase*

Reference solution B: A 1-in-100 solution of *Reference stock solution B* in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV

Analytical wavelength: 235 nm

Precolumn: 4-mm \times 2.5-cm; 5- μm packing L1

Column: 4-mm \times 25-cm; 5- μm packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection size: 50 μL . [NOTE—After each injection of the *Sample solution*, wash the precolumn by passing the *Mobile phase* backwards, at the same flow rate as applied in the test, for 30 min.]

System suitability

Samples: *Reference solution A* and *Reference solution B*

Suitability requirements

Resolution: NLT 2.0 between vinylpyrrolidinone and vinyl acetate, *Reference solution B*

Relative standard deviation: NMT 2.0% for 6 injections, *Reference solution A*

Analysis

Samples: *Sample solution* and *Reference solution A*

Record the chromatograms, and measure the responses for the vinylpyrrolidinone peak.

Acceptance criteria: The area of the peak from the *Sample solution* is NMT the area of the principal peak from *Reference solution A* (NMT 10 ppm).

SPECIFIC TESTS

• LOSS ON DRYING (731): Dry 0.5 g at 105° to constant weight: it loses NMT 5.0% of its weight.

• WATER-SOLUBLE SUBSTANCES

Sample: 25.0 g

Analysis: Transfer the *Sample* to a 400-mL beaker, add 200 mL of water, and stir on a magnetic stirrer, using a 5-cm stirring bar, for 1 h. Transfer to a 250-mL volumetric flask with the aid of 25 mL of water. Add water to volume. Allow the bulk of the solids to settle. Pass 100 mL of the relatively clear supernatant through a membrane filter of 0.45- μm pore size, protected against clogging by superimposing a membrane filter of 3- μm pore size. While filtering, stir the solution above the filter manually or with a mechanical stirrer, taking care not to physically damage the membrane filter. Transfer 50.0 mL of the clear filtrate to a tared 100-mL beaker, evaporate to dryness, and dry at 110° for 3 h.

Acceptance criteria: The weight of the residue does not exceed 75 mg (1.5%).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The label states the type (Type A or Type B).
- **USP REFERENCE STANDARDS (11)**
USP Crospovidone RS.

Gamma Cyclodextrin

($\text{C}_6\text{H}_{10}\text{O}_5$)₈
Cyclooctaamylose;
Cyclomaltooctaoase [17465-86-0].

1297.12

DEFINITION

Gamma Cyclodextrin is composed of 8 alpha-(1–4) linked D-glycopyranosyl units. It contains NLT 98.0% and NMT 102.0% of cyclooctaamylose ($C_6H_{10}O_5$)₈, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C.** It meets the requirements of the test for *Specific Rotation*.

ASSAY**PROCEDURE**

Mobile phase: Methanol and water (7:93)

System suitability solution: Prepare an aqueous solution containing 0.5 mg/mL each of USP Alpha Cyclodextrin RS, USP Beta Cyclodextrin RS, and USP Gamma Cyclodextrin RS.

Standard solution: 1.0 mg/mL of USP Gamma Cyclodextrin RS

Sample stock solution: Transfer 250 mg of Gamma Cyclodextrin to a 25-mL volumetric flask, and dissolve in water, with the aid of heat if necessary. Cool, and dilute with water to volume.

Sample solution: 1.0 mg/mL of Gamma Cyclodextrin, prepared from the *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 4.6-mm × 15-cm; 5-μm packing L1

Temperature

Detector: 40°

Column: 30°

Flow rate: 1.5 mL/min

Injection size: 50 μL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for gamma cyclodextrin, alfadex, and betadex are 0.8, 1.0, and 1.9, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the gamma cyclodextrin and alfadex peaks

Tailing factors: 0.8–2.0 for the three cyclodextrins

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of gamma cyclodextrin [($C_6H_{10}O_5$)₈] in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL) corrected for water found in *Specific Tests*, *Loss on Drying*

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%, determined on a 1.0-g specimen

- **HEAVY METALS**, *Method II* (231): NMT 5 ppm

RELATED COMPOUNDS

Mobile phase, System suitability solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: Transfer 5.0 mL of *System suitability solution* into a 50-mL volumetric flask, and dilute with water to volume.

Sample solution: Use the *Sample stock solution*, prepared as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: For the *Sample solution*, the areas of any peaks corresponding to alfadex (alpha cyclodextrin) or to betadex (beta cyclodextrin) are not greater than the area of the corresponding peaks in the chromatogram of the *Standard solution* (0.5%); and the sum of the areas of all the peaks, excluding the principal peak, the peaks corresponding to alfadex or to betadex, and artifact peaks, is not greater than the area of the peak corresponding to gamma cyclodextrin in the chromatogram of the *Standard solution* (0.5%).

REDUCING SUBSTANCES

Dextrose standard solution: 10.0 mg/mL of USP Dextrose RS, calculated on the anhydrous basis

Analysis: Transfer a quantity of Gamma Cyclodextrin, equivalent to 1.0 g on the dried basis, to a 500-mL conical flask. Dissolve in 10 mL of water, and add 25 mL of alkaline cupric citrate TS2. Cover the flask with aluminum foil, and boil the solution for 5 min. Cool in an ice bath to room temperature. Add 25 mL of 0.6 N acetic acid, 10 mL of 3 N hydrochloric acid, and 10 mL of 0.1 N iodine solution. [NOTE—The addition of these solutions must be in the order given.]

Titrate the solution with 0.1 N sodium thiosulfate VS, and determine the endpoint potentiometrically. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*). Calculate the difference in volumes required. Create a calibration curve by similarly titrating 0.25, 0.5, 0.75, and 1.0 mL of *Dextrose standard solution*. Plot the amount, in mg, of dextrose in each titrated *Dextrose standard solution* versus the volume consumed, in mL, of 0.1 N sodium thiosulfate VS in the titration, and draw a straight line through the four points. From the line so obtained and the volume of 0.1 N sodium thiosulfate VS required in the titration of Gamma Cyclodextrin, determine the weight, W , in mg, of the reducing substances as dextrose in the portion of Gamma Cyclodextrin taken.

Calculate the percentage of the reducing substances in the portion of Gamma Cyclodextrin taken:

$$\text{Result} = (W/W_C) \times F \times 100$$

W = weight of the reducing substances as dextrose in the portion of Gamma Cyclodextrin taken (mg)

W_C = weight of Gamma Cyclodextrin taken (g)

F = conversion factor, 10^{-3} g/mg

Acceptance criteria: NMT 0.5%

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g.

COLOR AND CLARITY OF SOLUTION

Sample solution: Transfer a quantity of Gamma Cyclodextrin, equivalent to 2.5 g on the dried basis, into a 25-mL volumetric flask, dissolve in and dilute with water that has been previously boiled and cooled to room temperature to volume, and mix.

Analysis: Determine the absorbance of the *Sample solution* in a 1-cm cell at 420 nm, with a suitable spectrophotometer, after correcting for the blank.

Acceptance criteria: At 420 nm, the absorbance is not greater than 0.20, and the solution is clear.

- **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 11.0% of its weight.

- **OPTICAL ROTATION, Specific Rotation (781S)**
Sample solution: 10 mg/mL
Analysis: Proceed as directed in the chapter.
Acceptance criteria: +174° to +180°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.
- **USP REFERENCE STANDARDS (11)**
 USP Alpha Cyclodextrin RS
 USP Beta Cyclodextrin RS
 USP Dextrose RS
 USP Gamma Cyclodextrin RS

Cyclomethicone

(C₂H₆OSi)_n
 Cyclopolydimethylsiloxane;
 Cyclomethicone [69430-24-6].

DEFINITION

Cyclomethicone is a fully methylated cyclic siloxane containing repeating units of [-(CH₃)₂SiO-]_n in which *n* is 4, 5, or 6, or a mixture of them. It contains NLT 98.0% of (C₂H₆OSi)_n, calculated as the sum of cyclomethicone 4, cyclomethicone 5, and cyclomethicone 6, and NLT 95.0% and NMT 105.0% of the labeled amount of any one or more of the individual cyclomethicone components.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197S)**
Sample: Use neat liquids.
Acceptance criteria: The IR absorption spectrum exhibits maxima only at the same wavelengths as that of a similar preparation of USP Cyclomethicone 4 RS, USP Cyclomethicone 5 RS, or USP Cyclomethicone 6 RS.

ASSAY

- **PROCEDURE**
Standard solution A: USP Cyclomethicone 4 RS
Standard solution B: USP Cyclomethicone 5 RS
Standard solution C: USP Cyclomethicone 6 RS
Sample solution: Cyclomethicone
Chromatographic system
 (See *Chromatography* (621), *System Suitability*).
Mode: GC
Detector: Thermal conductivity
Column: 3.66-m × 3-mm; packed with 20% liquid phase G1 on 60- to 80-mesh packing S1A
Temperatures
Injection port: 300°
Detector: 350°
Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
125	8	320	—

Carrier gas: Helium
Flow rate: 20 mL/min
Injection volume: 1 µL

Analysis

Samples: Standard solution A, Standard solution B, Standard solution C, and Sample solution
 Calculate the percentage of cyclomethicone 4, cyclomethicone 5, and cyclomethicone 6 by dividing 100 times the response of each peak at the retention time of the corresponding reference standard by the sum of all of the responses in the chromatogram. The percentages obtained from duplicate injections agree to within 1.0%.

Calculate the percentage purity by adding the percentages of cyclomethicone 4, cyclomethicone 5, and cyclomethicone 6.

Acceptance criteria

Sum of cyclomethicone 4, cyclomethicone 5, and cyclomethicone 6: NLT 98.0% of (C₂H₆OSi)_n
Labeled amount: 95.0%–105.0% of the labeled amount of any one or more of the individual cyclomethicone components

IMPURITIES

- **LIMIT OF NONVOLATILE RESIDUE**

Sample: 2.0 g

Analysis: Transfer the *Sample* into an open, tared aluminum dish, and evaporate in a circulating air oven at 150° for 2 h. Allow to cool in a desiccator, and weigh.

Acceptance criteria: NMT 3.0 mg, corresponding to NMT 0.15% (w/w)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to state, as part of the official title, the *n*-value of the Cyclomethicone. Where it is a mixture of 2 or 3 such cyclic siloxanes, the label states the *n*-value and percentage of each in the mixture.
- **USP REFERENCE STANDARDS (11)**
 USP Cyclomethicone 4 RS
 USP Cyclomethicone 5 RS
 USP Cyclomethicone 6 RS

Dehydroacetic Acid

C₈H₈O₄ 168.15
 Keto form: 2*H*-Pyran-2,4(3*H*)-dione, 3-acetyl-6-methyl-; 3-Acetyl-6-methyl-2*H*-pyran-2,4(3*H*)-dione [520-45-6].
 Enol form: 2*H*-Pyran-2-one, 3-acetyl-4-hydroxy-6-methyl-; 3-Acetyl-4-hydroxy-6-methyl-2*H*-pyran-2-one [771-03-9].

DEFINITION

Dehydroacetic Acid contains NLT 98.0% and NMT 100.5% of dehydroacetic acid (C₈H₈O₄), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

ASSAY

- **PROCEDURE**
Sample: 500 mg
Blank: 75 mL of neutralized alcohol
Titrimetric system
 (See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* into a 250-mL conical flask, dissolve it in 75 mL of neutralized alcohol, and add phenolphthalein TS. Titrate with *Titrant* to a pink endpoint that persists for NLT 30 s. Perform a blank determination.

Calculate the percentage of dehydroacetic acid ($C_8H_8O_4$) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F] / W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 168.2 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 98.0%–100.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS**, *Method II* <231>: NMT 10 µg/g

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, *Class I* <741>: 109°–111°
- **LOSS ON DRYING** <731>
Analysis: Dry a sample at 80° for 4 h.
Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.
- **USP REFERENCE STANDARDS** <11>
 USP Dehydroacetic Acid RS

Denatonium Benzoate

$C_{28}H_{34}N_2O_3 \cdot H_2O$ 464.60

$C_{28}H_{34}N_2O_3$ 446.59

Benzenemethanaminium, *N*-[2-[(2,6-dimethylphenyl)amino]-2-oxoethyl]-*N,N*-diethyl-, benzoate, monohydrate;
 Benzyldiethyl[(2,6-xylylcarbonyl)methyl] ammonium benzoate monohydrate [86398-53-0].
 Anhydrous [3734-33-6].

DEFINITION

Denatonium Benzoate, dried at 105° for 2 h, contains one molecule of water of hydration or is anhydrous. When dried at 105° for 2 h, it contains NLT 99.5% and NMT 101.0% of denatonium benzoate ($C_{28}H_{34}N_2O_3$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B. ULTRAVIOLET ABSORPTION** <197U>
Analytical wavelength: 263 nm
Sample solution: 100 µg/mL
Medium: Water
Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.
- **C.**
Sample: 150 mg
Analysis: Dissolve the *Sample* in 10 mL of water, and add 15 mL of trinitrophenol TS.

Acceptance criteria: A yellow precipitate is formed.

D.

Sample: 100 mg

Analysis: Dissolve the *Sample* in 10 mL of water, and add 20 mL of 2 N sulfuric acid and 15 mL of ammonium reineckate TS. Mix, filter through a sintered-glass crucible using gentle suction, and wash thoroughly with water. Remove as much water as possible with suction, and then dry in an oven at 105° for 1 h.

Acceptance criteria: The denatonium reineckate so obtained melts at about 170° (see *Melting Range or Temperature* <741>).

ASSAY

PROCEDURE

Sample: 900 mg, previously dried

Blank: 50 mL of glacial acetic acid

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 50 mL of glacial acetic acid, and add 1 drop of crystal violet TS. Titrate with *Titrant* to a green endpoint. Perform a blank determination, and make any necessary correction.

Calculate the percentage of denatonium benzoate ($C_{28}H_{34}N_2O_3$) in the portion of sample taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F] / W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 446.6 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 99.5%–101.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **CHLORIDE AND SULFATE**, *Chloride* <221>
Standard solution: 0.10 mL of 0.020 N hydrochloric acid
Sample solution: Dissolve 350 mg in 9 mL of water, add 1 mL of nitric acid, and filter.
Analysis: Use 1.0 mL of the *Sample solution*, and proceed as directed in the chapter
Acceptance criteria: 0.2%; the *Sample solution* shows no more chloride than the *Standard solution*.

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** <741>: 163°–170°, on a dried specimen
- **PH** <791>
Sample solution: 30 mg/mL
Acceptance criteria: 6.5–7.5
- **LOSS ON DRYING** <731>
Analysis: Dry at 105° for 2 h.
Acceptance criteria
Monohydrate form: 3.5%–4.5%
Anhydrous form: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate whether it is hydrous or anhydrous.
- **USP REFERENCE STANDARDS** <11>
 USP Denatonium Benzoate RS

Desoxycholic Acid

$C_{24}H_{40}O_4$ 392.57
Desoxycholic acid;
13 α ,12 α -Dihydroxycholan-24-oic acid [83-44-3].

DEFINITION

Desoxycholic Acid contains NLT 98.0% and NMT 102.0% of $C_{24}H_{40}O_4$, calculated on the dried basis.

IDENTIFICATION

- Add 2 drops of benzaldehyde and 3 drops of 75% sulfuric acid to about 10 mg of Desoxycholic Acid, heat at 50° for 5 min, and then add 10 mL of glacial acetic acid. A green color appears. (Cholic acid produces a brown color.)

ASSAY

PROCEDURE

Sample: 500 mg
Analysis: Transfer the *Sample* into a 250-mL Erlenmeyer flask, and add 20 mL of water and 40 mL of alcohol. Cover the flask with a watch glass, heat the mixture gently on a steam bath until the *Sample* is dissolved, and allow the mixture to cool to room temperature. Add a few drops of phenolphthalein TS to the solution, and titrate with 0.1 N sodium hydroxide to a pink endpoint that persists for 15 s. Each mL of 0.1 N sodium hydroxide is equivalent to 39.26 mg of $C_{24}H_{40}O_4$.
Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.2%, using 1.0 g
- **LIMIT OF LEAD**

[NOTE—Select reagents having as low a lead content as practicable, and store all solutions in high-density polyethylene containers. Rinse all plastic and glassware thoroughly with warm, 50% nitric acid followed by water.]

Standard lead solution: Prepare as directed under *Heavy Metals* (231), *Special Reagents*.

Standard solutions: [NOTE—Prepare these solutions on the day of use.] Transfer 10.0 and 50.0 mL of the *Standard lead solution* into two separate 100-mL volumetric flasks, add 10 mL of 3 N hydrochloric acid to each, and dilute with water to volume. The third standard, 10.0 μ g/mL, is taken directly from the *Standard lead solution*.

Sample solution: Transfer 10.0 g of Desoxycholic Acid, weighed to the nearest 0.1 mg, into an evaporating dish. Add 5 mL of 25% sulfuric acid (made by adding 25 mL of sulfuric acid to 75 mL of water), and distribute the 25% sulfuric acid solution uniformly. Within a hood, place the dish on a steam bath to evaporate most of the water. Place the dish on a burner, and slowly pre-ash the remaining *Sample solution* by expelling most of the sulfuric acid. Place the dish in a muffle furnace that has been set at 525°, and ash the contents of the dish until the residue appears free from carbon. Cool, and cautiously wash down the inside of the evaporation dish with water. Add 5 mL of 1 N hydrochloric acid. Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N hydrochloric acid and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer to a 10-mL volumetric flask, dilute with water to volume, and mix.

Sample blank: Prepare by ashing 5 mL of 25% sulfuric acid solution. Cool, and cautiously wash down the inside of the evaporation dish with water. Add 5 mL of 1 N hydrochloric acid. Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N hydrochloric acid and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer to a 10-mL volumetric flask, dilute with water to volume, and mix.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption

Analytical wavelength: 283.3 nm

Lamp: Lead electrodeless discharge

Flame: Air-acetylene flame

Slit width: 0.7 nm

Instrument blank: Water

Standard curve

Samples: *Standard solutions* and *Sample blank*

Plot: Corrected absorbance values versus their corresponding concentration (μ g/mL). [NOTE—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the *Standard solutions*.]

Analysis

Samples: *Sample solution* and *Sample blank*

[NOTE—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the *Sample solution*.]

From the *Standard curve*, determine the lead concentration in the *Sample solution*. Calculate the lead content, in ppm, in the portion of Desoxycholic Acid taken:

$$\text{Result} = C_s/W \times V$$

C_s = concentration of lead from the *Standard curve* (μ g/mL)

W = weight of the sample taken (g)

V = final volume of the sample (mL)

Acceptance criteria: NMT 4 ppm

SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** (781S): NLT +55°
Sample solution: 1% (w/v) solution in ethanol
- **MELTING RANGE OR TEMPERATURE, Class I** (741): 172°–175°
- **LOSS ON DRYING** (731): Dry a sample at 140° under vacuum of NMT 5 mm of mercury for 4 h: it loses NMT 1% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.

Dextrates

DEFINITION

Dextrates is a purified mixture of saccharides resulting from the controlled enzymatic hydrolysis of starch. It is either anhydrous or hydrated. Its dextrose equivalent is NLT 93.0% and NMT 99.0%, calculated on the dried basis.

ASSAY

DEXTROSE EQUIVALENT

Standard solution: 10 mg/mL of USP Dextrose RS

Sample solution: 10 mg/mL of Dextrates in hot water

Analysis: Transfer 25.0-mL portions of alkaline cupric tartrate TS to each of two boiling flasks. Bring the contents of one of the flasks to a boil, and titrate with the *Standard solution* to within 0.5 mL of the anticipated endpoint. Again heat the flask, with swirling, boil moderately for 2 min, add 2 drops of a 10-mg/mL methyl-

ene blue solution, immediately add 2 drops of the *Standard solution* from the buret, and again bring to a boil. Allow the cuprous oxide to settle slightly, and observe the color of the supernatant. Complete the titration within 3 min by adding the *Standard solution* dropwise, and boiling after each addition to the disappearance of the blue color, determined by viewing against a white background in daylight or under equivalent illumination. If more than 0.5 mL of the titrant was required after the addition of the indicator, repeat the titration, adding the necessary volume of titrant before adding the indicator. Bring the contents of the second flask to a boil, and similarly titrate with the *Sample solution*. Calculate the percentage of dextrose equivalent taken on the dried basis:

$$\text{Result} = (C_S/C_U) \times (V_S/V_U) \times [1/(1 - 0.01 \times A)] \times 100$$

C_S = concentration of USP Dextrose RS in the *Standard solution* (mg/mL)

C_U = concentration of Dextrates in the *Sample solution* (mg/mL)

V_S = titrant volume consumed by the *Standard solution* (mL)

V_U = titrant volume consumed by the *Sample solution* (mL)

A = loss on drying of Dextrates taken (%)

Acceptance criteria: 93.0%–99.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS**, *Method II* (231): NMT 5 µg/g

SPECIFIC TESTS

- **pH** (791)
Sample: 200 mg/mL in carbon dioxide-free water
Acceptance criteria: 3.8–5.8
- **LOSS ON DRYING** (731)
Analysis: Dry at 105° for 16 h in a convection oven.
Acceptance criteria: For the anhydrous form, NMT 2.0%; for the hydrated form, 7.8%–9.2%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store in a cool, dry place.
- **LABELING:** Label it to state whether it is anhydrous or hydrated.
- **USP REFERENCE STANDARDS** (11)
USP Dextrose RS

Dextrin

DEFINITION

Dextrin is starch, or partially hydrolyzed starch, modified by heating in a dry state, with or without acids, alkalies, or pH control agents. During heating, moisture may be added.

IDENTIFICATION

- **A.**
Sample: 1 g
Analysis: Suspend the *Sample* in 20 mL of water, and add a few drops of iodine TS.
Acceptance criteria: A blue to reddish-brown color results.
- **B.** Dextrin is very soluble in boiling water, forming a mucilaginous solution (difference from starch).

ASSAY

• REDUCING SUGARS (DEXTROSE EQUIVALENT)

Sample: A quantity of Dextrin equivalent to 2.0 g on the dried basis

Analysis: To the *Sample* add 100 mL of water, shake for 30 min, dilute with water to 200 mL, accurately measured, and filter. To 10.0 mL of alkaline cupric tartrate TS add 20.0 mL of the filtrate, mix, and heat on a hot plate adjusted to bring the solution to a boil in 3 min. Boil for 2 min, and cool quickly. Add 5 mL of potassium iodide solution (3 in 10) and 10 mL of 2 N sulfuric acid, mix, and titrate immediately with 0.1 N sodium thiosulfate VS, using starch TS, added toward the end of the titration, as an indicator.

Repeat the procedure beginning with "To 10.0 mL of alkaline cupric tartrate TS" using, in place of the filtrate, 20.0 mL of a solution (1 in 1000) of anhydrous dextrose, accurately prepared. Perform a blank titration. Compare ($V_B - V_U$) and ($V_B - V_S$).

$$\text{Result 1} = (V_B - V_U)$$

$$\text{Result 2} = (V_B - V_S)$$

V_B = volume of 0.1 N sodium thiosulfate consumed in the titrations of the blank

V_U = volume of 0.1 N sodium thiosulfate consumed in the titrations of the Dextrin

V_S = volume of 0.1 N sodium thiosulfate consumed in the titrations of the dextrose

Acceptance criteria: ($V_B - V_U$) is NMT ($V_B - V_S$), corresponding to NMT 10%, calculated as dextrose ($C_6H_{12}O_6$).

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%
- **CHLORIDE AND SULFATE**, *Chloride* (221)
Sample: 3.0 g
Control: 2.8 mL of 0.020 N hydrochloric acid in 75 mL of water
Analysis: Dissolve the *Sample* in 75 mL of boiling water. Cool, dilute with water to 75 mL, and filter if necessary. To 25 mL of this solution and the *Control*, add 2 mL of nitric acid and 1 mL of silver nitrate TS.
Acceptance criteria: Any turbidity produced is NMT that of the *Control*, corresponding to NMT 0.2% of chloride.
- **HEAVY METALS**, *Method II* (231): NMT 20 ppm
- **LIMIT OF PROTEIN**
Sample: 10 g
Analysis: Proceed as directed in *Nitrogen Determination* (461), using the *Sample* instead of 1 g, 60 mL of sulfuric acid instead of 20 mL, and multiplying the percentage of nitrogen found by 6.25.
Acceptance criteria: NMT 1.0%

SPECIFIC TESTS

- **ACIDITY**
Sample: 10.0 g
Analysis: Add the *Sample* to 100 mL of 70% alcohol, previously neutralized to phenolphthalein. Shake for 1 h, filter, and titrate 50 mL of the filtrate with 0.10 N sodium hydroxide.
Acceptance criteria: NMT 3.0 mL
- **BOTANIC CHARACTERISTICS**
Microscopic: Granules are similar in appearance to the starch from which the Dextrin has been prepared, except that when prepared from corn starch, many of the granules show concentric striations, and when prepared from potato starch, concentric striations are not clearly visible; the hilum is frequently bicleft; and a small proportion of the granules are distorted.
- **LOSS ON DRYING** (731): Dry a sample at a pressure not exceeding 100 mm of mercury at 120° for 4 h: it loses NMT 13.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Dextrose—see *Dextrose General Monographs***Dextrose Excipient****DEFINITION**

Dextrose Excipient is a sugar usually obtained by hydrolysis of starch. It contains one molecule of water of hydration.

IDENTIFICATION

- **A.**
Sample solution: 50 mg/mL
Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.
Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

IMPURITIES

- **HEAVY METALS** <231>
Test preparation: 4.0 g of Dextrose Excipient in 25 mL of water
Acceptance criteria: NMT 5 ppm
- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **SOLUBLE STARCH, SULFITES**
Sample solution: 1 g of Dextrose Excipient in 10 mL of water
Analysis: To the *Sample solution* add 1 drop of iodine TS.
Acceptance criteria: The liquid is colored yellow.

SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** <781S>
Sample solution: 100 mg/mL of Dextrose Excipient in 0.012 N ammonium hydroxide
Acceptance criteria: +52.5° to +53.5°
- **WATER DETERMINATION, Method III** <921>
Analysis: Dry at 105° for 16 h.
Acceptance criteria: 7.5%–9.5%
- **COLOR OF SOLUTION**
Sample solution: Dissolve 25 g of Dextrose Excipient in water to make 50.0 mL.
Control solution: Mix 1.0 mL of cobaltous chloride CS, 3.0 mL of ferric chloride CS, and 2.0 mL of cupric sulfate CS with water to make 10 mL. Dilute 3 mL of this solution with water to 50 mL.
Analysis: Make the comparison by viewing the *Sample solution* and *Control solution* downward in matched color-comparison tubes against a white surface.
Acceptance criteria: The *Sample solution* has no more color than the *Control solution*.
- **ACIDITY**
Sample solution: 100 mg/mL in carbon dioxide-free water
Analysis: Add phenolphthalein TS to 50 mL of the *Sample solution*, and titrate with 0.020 N sodium hydroxide to the production of a distinct pink color.
Acceptance criteria: NMT 0.30 mL
- **CHLORIDE AND SULFATE, Chloride** <221>
Standard solution: 0.50 mL of 0.020 N hydrochloric acid
Sample: 2.0 g
Acceptance criteria: 0.018%; the *Sample* shows no more chloride than the *Standard solution*.
- **CHLORIDE AND SULFATE, Sulfate** <221>
Standard solution: 0.50 mL of 0.020 N sulfuric acid
Sample: 2.0 g
Acceptance criteria: 0.025%; the *Sample* shows no more sulfate than the *Standard solution*.

- **ARSENIC, Method I** <211>: NMT 1 ppm
- **DEXTRIN**
Sample: 1 g of finely powdered Dextrose Excipient
Analysis: Reflux the *Sample* with 20 mL of alcohol.
Acceptance criteria: It dissolves completely.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate that it is not intended for parenteral use.

Diacetylated Monoglycerides**DEFINITION**

Diacetylated Monoglycerides is glycerin esterified with edible fat-forming fatty acids and acetic acid. It may be prepared by the interesterification of edible oils with triacetin in the presence of catalytic agents, followed by molecular distillation, or by the direct acetylation of edible monoglycerides with acetic anhydride without the use of catalyst or molecular distillation.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>
Sample: Undried specimen
Acceptance criteria: Meet the requirements

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS, Method II** <231>: NMT 10 µg/g

SPECIFIC TESTS

- **FATS AND FIXED OILS, Acid Value** <401>: NMT 3
- **FATS AND FIXED OILS, Hydroxyl Value** <401>: NMT 15
- **FATS AND FIXED OILS, Saponification Value** <401>: 365–395

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** <11>
 USP Diacetylated Monoglycerides RS

Diatrizoic Acid—see *Diatrizoic Acid General Monographs***Dibutyl Phthalate**

$C_{16}H_{22}O_4$ 278.34
 1,2-Benzenedicarboxylic acid, dibutyl ester [84-74-2].

DEFINITION

Dibutyl Phthalate contains NLT 99.0% and NMT 101.0% of dibutyl phthalate ($C_{16}H_{22}O_4$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>: On undried specimen
- **B.** It meets the requirements in *Specific Tests for Refractive Index* <831>.

ASSAY**• PROCEDURE****Sample:** 0.75 g**Titrimetric system**(See *Titrimetry* <541>.)**Mode:** Residual titration**Titrant:** 0.5 N alcoholic potassium hydroxide VS**Back-titrant:** 0.5 N hydrochloric acid VS**Endpoint detection:** Visual

Analysis: Transfer the *Sample* to a flask, add 25.0 mL of *Titrant*, attach a reflux condenser to the flask, and boil in a water bath for 1 h. Add 1 mL of phenolphthalein TS. Titrate immediately with *Back-titrant*. Perform a blank determination. Each mL of *Titrant* is equivalent to 69.59 mg of dibutyl phthalate (C₁₆H₂₂O₄).

Acceptance criteria: 99.0%–101.0%**IMPURITIES****• RESIDUE ON IGNITION** <281>**Sample:** 1.0 g**Acceptance criteria:** NMT 0.1%**• RELATED COMPOUNDS****Internal standard solution:** 3 mg/mL of dibenzyl in methylene chloride**Sample stock solution:** 100 mg/mL of Dibutyl Phthalate in methylene chloride**Sample solution A:** Dilute 5.0 mL of *Sample stock solution* with methylene chloride to 10 mL.**Sample solution B:** Add 5.0 mL of *Sample stock solution*, 1.0 mL of *Internal standard solution*, and dilute with methylene chloride to 10 mL.**Standard solution:** Add 1.0 mL of *Sample solution A*, 10.0 mL of *Internal standard solution*, and dilute with methylene chloride to 100 mL.**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** GC**Detector:** Flame ionization**Column:** 4-mm × 1.5-m; packed with 3% liquid phase G3 on support S1A**Temperatures****Column:** 190°**Injection port:** 225°**Detector:** 225°**Carrier gas:** Nitrogen**Flow rate:** 30 mL/min**Run time:** Three times the retention time of dibutyl phthalate**Injection volume:** 1 µL**System suitability****Samples:** *Sample solution A* and *Standard solution***Suitability requirements**

[NOTE—The elution order is the internal standard peak followed by the dibutyl phthalate peak.]

Resolution: NLT 12 between the internal standard and the dibutyl phthalate peak, *Standard solution*

Additional requirements: Verify that there is no peak with the same retention time as the internal standard in *Sample solution A*. If such a peak is observed, make any necessary correction for factors of dilution, and then determine the area due to the interfering component that must be subtracted from the area of the internal standard peak appearing in the chromatogram recorded for *Sample solution B*.

Analysis**Samples:** *Sample solution B* and *Standard solution*

Calculate the peak area ratio of dibutyl phthalate to the internal standard for the *Standard solution*. Calculate the peak area ratio of the sum of all peaks, excluding the main peak, the solvent peak, and the internal standard peak, to the internal standard peak for *Sample solution B*.

Acceptance criteria: NMT 1.0%; the ratio for *Sample solution B* is NMT the ratio for the *Standard solution*.**SPECIFIC TESTS****• SPECIFIC GRAVITY** <841>: 1.043–1.048 at 20°**• REFRACTIVE INDEX** <831>: 1.490–1.495 at 20°**• ACIDITY****Sample:** 20.0 g

Analysis: Mix the *Sample* with 50 mL of alcohol that previously has been neutralized to a phenolphthalein endpoint. Add 0.2 mL of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS.

Acceptance criteria: NMT 0.50 mL is required to change the color of the indicator.**• WATER DETERMINATION, Method I** <921>: NMT 0.2%**• APPEARANCE****Sample:** Dibutyl Phthalate (neat)

Standard solution: Prepared immediately before use by mixing 2.4 mL of ferric chloride CS and 0.6 mL of cobaltous chloride CS with dilute hydrochloric acid (10 mg/mL) to make 10 mL, and diluting 5 mL of this solution with dilute hydrochloric acid (10 mg/mL) to make 100 mL.

Analysis: Compare the *Sample* and the *Standard solution* by viewing the substance and the solution downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* <631>).

Acceptance criteria: The *Sample* is clear and not more intensely colored than the *Standard solution*.**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.**• USP REFERENCE STANDARDS** <11>

USP Dibutyl Phthalate RS

Dibutyl Sebacate**DEFINITION**

Dibutyl Sebacate consists of esters of *n*-butyl alcohol and saturated dibasic acids, principally sebacic acid. It contains NLT 92.0% of dibutyl sebacate (C₁₈H₃₄O₄).

ASSAY**• PROCEDURE**

System suitability solution: Add 0.2 g of methyl heptadecanoate to 0.3 g of Dibutyl Sebacate, and mix to dissolve.

Chromatographic system(See *Chromatography* <621>, *System Suitability*.)**Mode:** GC**Detector:** Flame ionization**Column:** 2-mm × 1.8-m; packed with 10% liquid phase G41 on 100- to 120-mesh support S1A**Column temperature:** See *Table 1*.**Table 1**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	—	150	2
150	4	280	30

Carrier gas: Helium**Flow rate:** 30 mL/min**Injection volume:** 1 µL**System suitability****Sample:** *System suitability solution*

[NOTE—The relative retention times for methyl heptadecanoate and dibutyl sebacate are 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.8 between dibutyl sebacate and methyl heptadecanoate

Relative standard deviation: NMT 2.0%

Analysis

Sample: Dibutyl Sebacate (neat)

Calculate the percentage of dibutyl sebacate ($C_{18}H_{34}O_4$) in the portion of sample taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for dibutyl sebacate

r_T = sum of the responses of all the peaks

Acceptance criteria: NLT 92.0%

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 0.935–0.939 at 20°
- **REFRACTIVE INDEX** (831): 1.429–1.441
- **FATS AND FIXED OILS, Acid Value** (401): NMT 0.1
- **FATS AND FIXED OILS, Saponification Value** (401): 352–360

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Dichlorodifluoromethane

CCl_2F_2

120.91

Methane, dichlorodifluoro-;
Dichlorodifluoromethane [75-71-8].

DEFINITION

Dichlorodifluoromethane contains NLT 99.6% and NMT 100.0% of dichlorodifluoromethane (CCl_2F_2), calculated on the anhydrous basis.

IDENTIFICATION

- **A.** The IR absorption spectrum, determined in a 10-cm cell with sodium chloride windows, at atmospheric pressure, exhibits maxima, among others, at the following wavelengths (μm): 4.33 (m), 4.46 (m), 4.56 (m), 6.29 (m), 7.25 (m), 8.05 (s), 8.63 (s), 9.1 (vs), 10.7 (vs), 10.8 (vs), 11.2 (m), 11.3 (m), 13.1 (w), and 13.9 (w). The stronger maxima are best obtained at pressures less than 10 mm of mercury.

ASSAY• **PROCEDURE**

System suitability solution: Introduce a liquid-phase mixture of dichlorodifluoromethane, dichlorotetrafluoroethane, and trichloromonofluoromethane into an evacuated headspace vial.

Sample solution: Introduce the liquid phase of Dichlorodifluoromethane into an evacuated headspace vial.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm \times 1.8-m stainless steel; 1% phase G25 on support S12

Temperatures

Injection port: 110°

Detector: 200°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	10	170	5

Carrier gas: Helium

Flow rate: 20 mL/min

Headspace sampler: The bath temperature is 100°, the valve/loop temperature is 105°, and the sampling time is 3 s. Make adjustments as necessary to optimize peak areas to record trace-level impurities.

System suitability

Sample: Gas phase headspace of the *System suitability solution*

[NOTE—The relative retention times for dichlorodifluoromethane, dichlorotetrafluoroethane, and trichloromonofluoromethane are about 0.5, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between dichlorotetrafluoroethane and trichloromonofluoromethane

Analysis

Sample: Gas phase headspace of the *Sample solution*
Calculate the percentage of dichlorodifluoromethane (CCl_2F_2) in the portion of Dichlorodifluoromethane taken.

Acceptance criteria: 99.6%–100.0% on the anhydrous basis

IMPURITIES• **INORGANIC CHLORIDES**

Sample: 7 g

Analysis: Place 5 mL of anhydrous methanol in a test tube, add 3 drops of a saturated solution of silver nitrate in anhydrous methanol, and shake. Add the *Sample*.

Acceptance criteria: No opalescence or turbidity is produced.

• **CHROMATOGRAPHIC PURITY**

Analysis: In the chromatograms from the *Assay*, identify the dichlorotetrafluoroethane and trichloromonofluoromethane peaks from the relative retention times of those peaks in the chromatogram of the *System suitability solution*.

Acceptance criteria

Sum of the peak areas for dichlorotetrafluoroethane and trichloromonofluoromethane: NMT 0.2% of the total of all peak areas

Sum of the areas of all peaks other than that for dichlorotetrafluoromethane: NMT 0.4% of the total of all peak areas

SPECIFIC TESTS• **BOILING TEMPERATURE**

Analysis: Proceed as directed in *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601), *Approximate Boiling Temperature*.

Acceptance criteria: Approximately –30°

• **WATER**

Analysis: Proceed as directed in *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601), *Water Content and Water Determination* (921), *Method 1c*.

Acceptance criteria: NMT 0.001%

• **HIGH-BOILING RESIDUES**

Analysis: Proceed as directed in *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601), *High-Boiling Residues, Method 1*.

Acceptance criteria: NMT 0.01%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight cylinders, and avoid exposure to excessive heat.

Dichlorotetrafluoroethane

$C_2Cl_2F_4$ 170.92
Ethane, 1,2-dichloro-1,1,2,2-tetrafluoro-;
1,2-Dichlorotetrafluoroethane [76-14-2].

DEFINITION

Dichlorotetrafluoroethane contains NLT 99.6% and NMT 100.0% of dichlorotetrafluoroethane ($C_2Cl_2F_4$), calculated on the anhydrous basis.

IDENTIFICATION

- A.** The IR absorption spectrum, determined in a 10-cm cell with sodium chloride windows, at atmospheric pressure, exhibits maxima, among others, at the following wavelengths (μm): 4.34 (s), 4.48 (m), 5.28 (m), 5.95 (m), 7.36 (s), 9.5 (vs), 10.9 (vs), 11.8 (vs), 13.6 (s), and 14.8 (s). The stronger maxima are best obtained at pressures less than 10 mm of mercury.

ASSAY

PROCEDURE

System suitability solution: Introduce a liquid-phase mixture of dichlorodifluoromethane, dichlorotetrafluoroethane, and trichloromonofluoromethane into an evacuated headspace vial.

Sample solution: Introduce the liquid phase of Dichlorotetrafluoroethane into an evacuated headspace vial.

Chromatographic system

Diethanolamine

$C_4H_{11}NO_2$ 105.14
Ethanol, 2,2'-iminobis-;
2,2'-Iminodiethanol [111-42-2].

DEFINITION

Diethanolamine is a mixture of ethanolamines, consisting largely of diethanolamine. It contains NLT 98.5% and NMT 101.0% of ethanolamines, calculated on the anhydrous basis as $NH(C_2H_4OH)_2$.

IDENTIFICATION

- A. INFRARED ABSORPTION** <197F>

ASSAY

PROCEDURE

Sample: 2 g

Blank: 50 mL of water

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.5 N hydrochloric acid VS

Endpoint detection: Visual

Analysis: To the *Sample* add 50 mL of water and bromocresol green TS. Titrate with the *Titrant*. Perform a blank determination.

Calculate the percentage of diethanolamine, expressed as $\text{NH}(\text{C}_2\text{H}_4\text{OH})_2$, in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 105.14 (mg/mEq)

W = *Sample* weight (mg)

Acceptance criteria: 98.5%–101.0% on the anhydrous basis

IMPURITIES

• LIMIT OF TRIETHANOLAMINE

Mixed indicator: 1.5 mg/mL of methyl orange and 0.8 mg/mL of xylene cyanole FF in water

Sample: 20 g

Blank: 100 mL of methanol and 6–8 drops of *Mixed indicator*

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.5 N alcoholic sulfuric acid VS

Endpoint detection: Visual

Analysis: Place 100 mL of methanol and 6–8 drops of *Mixed indicator* in a 500-mL glass-stoppered conical flask, and neutralize with 0.1 N alcoholic sulfuric acid or 0.1 N alcoholic potassium hydroxide. The neutral solution is amber when viewed by transmitted light and is red-brown when viewed by reflected light. Add the *Sample*. Cautiously add 75 mL of acetic anhydride, and swirl to effect complete solution. Cool to room temperature, if necessary, and allow to stand at room temperature for 30 min. Titrate with the *Titrant*. Perform a blank determination.

Calculate the percentage of triethanolamine in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 149.2 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: NMT 1.0% by weight

SPECIFIC TESTS

• **REFRACTIVE INDEX (831):** 1.473–1.476 at 30°

• **WATER DETERMINATION, Method I (921)**

Sample: 20 g

Solvent: A mixture of methanol and glacial acetic acid (40:25)

Acceptance criteria: NMT 0.15%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

USP Diethanolamine RS

Diethyl Phthalate

$\text{C}_{12}\text{H}_{14}\text{O}_4$

222.24

1,2-Benzenedicarboxylic acid, diethyl ester;

Diethyl phthalate [84-66-2].

DEFINITION

Diethyl Phthalate contains NLT 98.0% and NMT 102.0% of diethyl phthalate ($\text{C}_{12}\text{H}_{14}\text{O}_4$), calculated on the anhydrous basis. [**CAUTION**—Avoid contact.]

IDENTIFICATION

• **A. INFRARED ABSORPTION (197F):** On undried specimen

ASSAY

• PROCEDURE

Sample: 1.5 g

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.5 N alcoholic potassium hydroxide VS

Back-titrant: 0.5 N hydrochloric acid VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a flask, add 50.0 mL of the *Titrant*, and boil with a reflux condenser on a water bath for 1 h. Add 20 mL of water, then add phenolphthalein TS. Titrate the excess potassium hydroxide with the *Back-titrant*. Perform a blank determination. Each mL of 0.5 N potassium hydroxide is equivalent to 55.56 mg of diethyl phthalate ($\text{C}_{12}\text{H}_{14}\text{O}_4$).

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

• **RESIDUE ON IGNITION (281)**

Sample: 10 g

Analysis: Gently heat the *Sample* until the liquid has evaporated, and ignite the residue to constant weight.

Acceptance criteria: NMT 0.02%

SPECIFIC TESTS

• **SPECIFIC GRAVITY (841):** 1.118–1.122 at 20°

• **REFRACTIVE INDEX (831):** 1.500–1.505 at 20°

• **ACIDITY**

Sample: 20.0 g

Analysis: Mix the *Sample* with 50 mL of alcohol that previously has been neutralized to a phenolphthalein endpoint, and titrate with 0.1 N sodium hydroxide VS to a phenolphthalein endpoint.

Acceptance criteria: NMT 0.50 mL is required for neutralization.

• **WATER DETERMINATION, Method I (921):** NMT 0.2%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS (11)**

USP Diethyl Phthalate RS

Add the following:

▲ Diethyl Sebacate

$\text{CH}_3\text{CH}_2\text{OOC}(\text{CH}_2)_8\text{COOCH}_2\text{CH}_3$

$\text{C}_{14}\text{H}_{26}\text{O}_4$ 258.35

Decanedioic acid, 1,10-diethyl ester;
Diethyl 1,10-decanedioate [110-40-7].

DEFINITION

Diethyl Sebacate consists of the diester of alcohol and sebacic acid. It contains NLT 98.0% and NMT 100.5% of $\text{C}_{14}\text{H}_{26}\text{O}_4$.

IDENTIFICATION

- A. INFRARED ABSORPTION** (197F)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Internal standard solution: 0.9 mg/mL of methyl heptadecanoate in alcohol

Standard solution: 1.0 mg/mL of USP Diethyl Sebacate RS in the *Internal standard solution*

Sample solution: 1.0 mg/mL of Diethyl Sebacate in the *Internal standard solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m fused silica capillary column; 1.5-μm layer of phase G1

Temperatures

Detector: 300°

Injection port: 300°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	—	150	5
150	10	250	5

Carrier gas: Helium

Linear velocity: 50 cm/s

Injection size: 1 μL

Injection type: Split injection. The split ratio is about 3:1.

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for diethyl sebacate and methyl heptadecanoate are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 2.0 between diethyl sebacate and methyl heptadecanoate

Relative standard deviation: NMT 2.0%, ratio of the peak response of diethyl sebacate to that of methyl heptadecanoate

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $\text{C}_{14}\text{H}_{26}\text{O}_4$ in the portion of Diethyl Sebacate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = ratio of the peak response of diethyl sebacate to that of methyl heptadecanoate from the *Sample solution*

R_S = ratio of the peak response of diethyl sebacate to that of methyl heptadecanoate from the *Standard solution*

C_S = concentration of USP Diethyl Sebacate RS in the *Standard solution* (mg/mL)

C_U = concentration of Diethyl Sebacate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–100.5%

Diethylene Glycol Monoethyl Ether

$\text{C}_6\text{H}_{14}\text{O}_3$

134.17

DEFINITION

Diethylene Glycol Monoethyl Ether contains NLT 99.0% and NMT 101.0% of $\text{C}_6\text{H}_{14}\text{O}_3$. It is produced by condensation of ethylene oxide and alcohol, followed by distillation.

IDENTIFICATION

- A. INFRARED ABSORPTION** (197F): Potassium bromide plates being used
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *System suitability solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Sample: Diethylene Glycol Monoethyl Ether (neat)

System suitability solution: 1 mg/mL each of 2-methoxyethanol, 2-ethoxyethanol, ethylene glycol, diethylene glycol, and USP Diethylene Glycol Monoethyl Ether RS in methanol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica bonded with a 1.0-μm layer of phase G46

Temperature

Injector: 250°

Detector: 275°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
120	—	120	1
120	12	225	2

Carrier gas: Helium

Flow rate: 2.2 mL/min

Injection size: 0.5 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for 2-methoxyethanol, 2-ethoxyethanol, ethylene glycol, diethylene glycol monoethyl ether, and diethylene glycol are about 0.40, 0.43, 0.50, 0.93, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between 2-ethoxyethanol and ethylene glycol

Relative standard deviation: NMT 2.0%, determined from diethylene glycol monoethyl ether

Analysis

Sample: Diethylene Glycol Monoethyl Ether (neat)

Calculate the percentage of diethylene glycol monoethyl ether (C₆H₁₄O₃) in the portion of Diethylene Glycol Monoethyl Ether taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for diethylene glycol monoethyl ether

r_T = sum of the responses of all the peaks

Acceptance criteria: 99.0%–101.0%

IMPURITIES

Organic Impurities

• **PROCEDURE 1: LIMIT OF FREE ETHYLENE OXIDE**

Acetaldehyde solution: 10 µg/mL of acetaldehyde.

[NOTE—Prepare fresh just before use.]

Ethylene oxide stock solution

[**CAUTION**—Ethylene oxide is toxic and flammable.

Prepare these solutions in a well-ventilated fume hood, using great care. Protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask.]

[NOTE—Before using the polyethylene glycol 200 in this test, remove any volatile components from it by placing 500 mL of the polyethylene glycol 200 in a 1000-mL round-bottom flask, attaching the flask to a rotary evaporator, and evaporating at a temperature of 60° at a pressure of 1.5–2.5 kPa for 6 h.]

Fill a chilled pressure bottle with liquid ethylene oxide, and store in a freezer when not in use. Use a small piece of polyethylene film to protect the liquid from contact with the rubber gasket. Tare a glass-stoppered conical flask, add 50 mL of polyethylene glycol 200, and reweigh the flask. Transfer 5 mL of the liquid ethylene oxide to a 100-mL beaker chilled in a mixture of sodium chloride and wet ice (1:3). Using a gas-tight gas chromatographic syringe that has been previously cooled to –10°, transfer 300 µL (corresponding to about 250 mg) of liquid ethylene oxide to the polyethylene glycol 200, and swirl gently to mix. Replace the stopper, reweigh the flask, and determine the amount of ethylene oxide absorbed by weight difference. Adjust the weight of the mixture with polyethylene glycol 200 to 100.0 g, replace the stopper, and swirl gently to mix. This stock solution contains 2.5 mg/g of ethylene oxide. [NOTE—Prepare this *Ethylene oxide stock solution* fresh just before use, and store in a refrigerator.]

Ethylene oxide standard solution A: Tare a glass-stoppered conical flask, and chill it in a refrigerator. Add 35 mL of polyethylene glycol 200, and reweigh the flask. Use a gas-tight gas chromatographic syringe

that has been chilled in a refrigerator, and transfer 1 g of the chilled *Ethylene oxide stock solution* to the tared, conical flask. Adjust the weight of the solution with polyethylene glycol 200 to 50.0 g, replace the stopper, and swirl gently to mix. Transfer 10 g of this solution to a 50-mL volumetric flask. Add 30 mL of water, and mix. Dilute with water to volume, and mix to obtain a solution containing 10 µg/mL of ethylene oxide.

[NOTE—Prepare this solution fresh just before use, and store in a refrigerator.]

Ethylene oxide standard solution B: Transfer 10.0 mL of *Ethylene oxide standard solution A* to a 50-mL volumetric flask, and dilute with water to volume to obtain a solution containing 2 µg/mL of ethylene oxide. [NOTE—Prepare this solution fresh just before use, and store in a refrigerator.]

System suitability solution: Transfer 0.5 mL of *Ethylene oxide standard solution B* to a 10-mL pressure headspace vial, and add 0.1 mL of *Acetaldehyde solution* and 0.1 mL of water, seal the vial, and mix. Heat the mixture at 70° for 45 min.

Standard solution: Transfer 1 g of Diethylene Glycol Monoethyl Ether to a 10-mL pressure headspace vial, and add 0.5 mL of *Ethylene oxide standard solution B* and 0.5 mL of water. Seal the vial, and mix. Heat the mixture at 70° for 45 min.

Sample solution: Transfer 1 g of Diethylene Glycol Monoethyl Ether to a 10-mL pressure headspace vial, add 1 mL of water, seal the vial, and mix. Heat the mixture at 70° for 45 min.

Chromatographic system

(See *Chromatography* {621}, *System Suitability*.)

[NOTE—The use of a headspace apparatus that automatically transfers a measured amount of headspace is allowed.]

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m glass or quartz capillary bonded with a 1.0-µm layer of phase G1

Temperature

Injector: 150°

Detector: 250°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	—	50	5
50	5	180	—
180	30	230	5

Carrier gas: Helium

Flow rate: 1 mL/min

Injection size: 1 mL

System suitability

Sample: Gaseous headspace of the *System suitability solution*

[NOTE—The relative retention times for acetaldehyde and ethylene oxide are about 0.94 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the acetaldehyde and ethylene oxide peaks

Relative standard deviation: NMT 15%

Analysis

Samples: Gaseous headspace of the *Standard solution* and *Sample solution*

[NOTE—Use a heated, gas-tight gas chromatographic syringe.]

Calculate the amount of ethylene oxide in the portion of Diethylene Glycol Monoethyl Ether taken:

$$\text{Result} = r_U / [(r_S \times W_U) - (r_U \times W_S)]$$

- r_U = ethylene oxide peak area from the *Sample solution*
 r_S = ethylene oxide peak area from the *Standard solution*
 W_U = weight of Diethylene Glycol Monoethyl Ether taken to prepare the *Sample solution* (g)
 W_S = weight of Diethylene Glycol Monoethyl Ether taken to prepare the *Standard solution* (g)

Acceptance criteria: NMT 1 µg/g

PROCEDURE 2: LIMIT OF 2-METHOXYETHANOL, 2-ETHOXYETHANOL, ETHYLENE GLYCOL, AND DIETHYLENE GLYCOL

Sample, System suitability solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis: Proceed as directed in the *Assay*.

Calculate the percentage of 2-methoxyethanol in the portion of Diethylene Glycol Monoethyl Ether taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- r_U = peak response for 2-methoxyethanol
 r_T = sum of all the peak responses
 Calculate the percentage of 2-ethoxyethanol in the portion of Diethylene Glycol Monoethyl Ether taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- r_U = peak response for 2-ethoxyethanol
 r_T = sum of all the peak responses
 Calculate the percentage of ethylene glycol in the portion of Diethylene Glycol Monoethyl Ether taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- r_U = peak response for ethylene glycol
 r_T = sum of all the peak responses
 Calculate the percentage of diethylene glycol in the portion of Diethylene Glycol Monoethyl Ether taken:

$$\text{Result} = (r_U/r_T) \times 100$$

- r_U = peak response for diethylene glycol
 r_T = sum of all the peak responses
 Acceptance criteria: See *Impurity Table 1*.

Impurity Table 1

Name	Acceptance Criteria, NMT (ppm)
2-Methoxyethanol	50
2-Ethoxyethanol	160
Ethylene glycol	620
Diethylene glycol	150

SPECIFIC TESTS

- REFRACTIVE INDEX (831):** 1.426–1.428 at 20°
- WATER DETERMINATION, Method I (921):** NMT 0.1%, determined on a 10-g specimen
- FATS AND FIXED OILS, Acid Value (401)**
 [NOTE—This test must be performed promptly after sampling to avoid oxidation of the sample specimen.]
Analysis: Dissolve 30 g of Diethylene Glycol Monoethyl Ether in 30 mL of neutralized alcohol. Add 1 mL of phenolphthalein TS, and titrate with 0.01 N alcoholic potassium hydroxide VS to produce a permanent, faint pink color.
Acceptance criteria: The acid value so obtained is NMT 0.1.
- FATS AND FIXED OILS, Peroxide Value (401):** NMT 8.0, 2 g being used

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers under an atmosphere of an inert gas, at a temperature not exceeding 35°.
- LABELING:** Label it to indicate that it is intended for topical or transdermal use only and it is stored under an atmosphere of an inert gas. The material is not to be used for parenterals.
- USP REFERENCE STANDARDS (11)**
 USP Diethylene Glycol Monoethyl Ether RS

Diethylene Glycol Stearates

DEFINITION

Diethylene Glycol Stearates is a mixture of diethylene glycol monoesters and diesters of stearic and palmitic acids. It contains NLT 45.0% of monoesters produced from the condensation of ethylene glycol and stearic acid of vegetable or animal origin.

IDENTIFICATION

- A.** It meets the requirements in *Specific Tests for Melting Range or Temperature, Class II (741)*.
- B.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition (401)*.

ASSAY

PROCEDURE

Mobile phase: Tetrahydrofuran

Sample solution: 40 mg/mL of Diethylene Glycol Stearates in tetrahydrofuran

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.5-mm × 60-cm; containing 5-µm 100Å packing L21. [NOTE—Two or three 7.5-mm × 30-cm L21 columns may be used in place of the 60-cm column, provided that *System suitability* requirements are met.]

Temperatures

Detector: 40°

Column: 40°. [NOTE—The column temperature may be lowered to ambient temperature, although working at 40° provides stable separation conditions and ensures better sample solubility.]

Flow rate: 1 mL/min

Injection volume: 40 µL

System suitability

Sample: *Sample solution*

[NOTE—The relative retention times for diesters, monoesters, and diethylene glycol are 0.78, 0.84, and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 2.0% for the monoesters peak

Analysis

Sample: *Sample solution*

Calculate the percentage of free fatty acids, E , in the portion of Diethylene Glycol Stearates taken:

$$E = I_A \times 270/561.1$$

I_A = acid value, determined in *Specific Tests for Fats and Fixed Oils, Acid Value (Free Fatty Acids) (401)*

Calculate the percentage of monoesters in the portion of *Sample* taken:

$$\text{Result} = [r_M/(r_M + r_D)] \times (100 - D - E)$$

r_M = peak response for the monoesters

- r_D = peak response for the diesters
 D = percentage of free diethylene glycol in the portion of Diethylene Glycol Stearates taken, as determined in *Impurities for Limit of Free Diethylene Glycol*

Acceptance criteria: NLT 45.0% of monoesters

IMPURITIES

• LIMIT OF FREE DIETHYLENE GLYCOL

Mobile phase, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Standard solution A: 0.5 mg/mL of diethylene glycol in tetrahydrofuran

Standard solution B: 1.0 mg/mL of diethylene glycol in tetrahydrofuran

Standard solution C: 2.0 mg/mL of diethylene glycol in tetrahydrofuran

Standard solution D: 4.0 mg/mL of diethylene glycol in tetrahydrofuran

Analysis

Samples: *Sample solution* and *Standard solutions*

Plot the diethylene glycol peak responses obtained versus the concentration of diethylene glycol in the *Standard solutions*. From the standard curve so obtained, determine the diethylene glycol concentration in the sample.

Calculate the percentage of free diethylene glycol in the portion of sample taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of diethylene glycol, determined from the standard curve (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: NMT 8.0%

SPECIFIC TESTS

• MELTING RANGE OR TEMPERATURE, *Class II* (741): 43°–50°

• FATS AND FIXED OILS, *Acid Value (Free Fatty Acids)* (401)

Sample: 10.0 g

Acceptance criteria: NMT 4.0

• FATS AND FIXED OILS, *Iodine Value* (401): NMT 3.0

• FATS AND FIXED OILS, *Saponification value* (401)

Sample: 2.0 g

Acceptance criteria: 150–170

• FATS AND FIXED OILS, *Fatty Acid Composition* (401): 40.0%–60.0% of stearic acid, and the sum of palmitic and stearic acids is NLT 90.0%.

• ARTICLES OF BOTANICAL ORIGIN, *Total Ash* (561)

Sample: 1.0 g

Acceptance criteria: NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements are specified.
- **LABELING:** Label it to indicate that it is intended for topical and vaginal use only.

DEFINITION

Diisopropanolamine is a mixture of isopropanolamines, consisting largely of diisopropanolamine. It contains NLT 98.0% and NMT 102.0% of isopropanolamines, calculated as $\text{NH}(\text{C}_3\text{H}_7\text{OH})_2$ on the anhydrous basis.

IDENTIFICATION

- **A.** The IR absorption spectrum of a thin film exhibits regions of absorption between 2.8 and 4.0 μm , between 6.7 and 7.1 μm , and between 8.5 and 9.4 μm ; and several characteristic peaks, the most pronounced being at about 7.3, 7.5, 8.3, 9.6, 10.4, and 10.7 μm .

ASSAY

• PROCEDURE

Sample: 2 g

Blank: 50 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.5 N hydrochloric acid VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 250-mL conical flask. Add 50 mL of water and bromocresol green TS. Titrate with *Titrant*. Perform a blank determination, and make any necessary correction.

Calculate the percentage of isopropanolamines, expressed as $\text{NH}(\text{C}_3\text{H}_7\text{OH})_2$, in the portion of Diisopropanolamine taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 0.1332 g/mEq

W = *Sample* weight (g)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

• LIMIT OF TRIISOPROPANOLAMINE

Indicator solution: 1.5 mg/mL of methyl orange and 0.8 mg/mL of xylene cyanole FF

Sample: 20 g

Blank: 100 mL of methanol

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.5 N alcoholic sulfuric acid VS

Endpoint detection: Visual

Analysis: To a glass-stoppered, 500-mL conical flask add 100 mL of methanol and 6–8 drops of *Indicator solution*, and neutralize with 0.1 N alcoholic sulfuric acid or 0.1 N alcoholic potassium hydroxide. The neutral solution is amber when viewed by transmitted light and is red-brown when viewed by reflected light. Add the *Sample*, cautiously add 75 mL of acetic anhydride, and swirl to dissolve. Allow to stand at room temperature for 30 min. Cool to room temperature, if necessary. Titrate with *Titrant*. Perform a blank determination, and make any necessary correction.

Diisopropanolamine

$\text{C}_6\text{H}_{15}\text{NO}_2$

2-Propanol, 1,1'-iminobis-;

1,1'-Iminodi-2-propanol [110-97-4].

133.19

Calculate the percentage of triisopropanolamine in the portion of Diisopropanolamine taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = Titrant volume consumed by the *Sample* (mL)

V_B = Titrant volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 0.1914 g/mEq

W = *Sample* weight (g)

Acceptance criteria: NMT 1.0% by weight

SPECIFIC TESTS

• WATER DETERMINATION, Method I (921)

Solvent: A mixture of 5.0 mL of glacial acetic acid and 25 mL of methanol

Acceptance criteria: NMT 0.50%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No specific storage conditions are required.

Dimethicone

Dimethicone;

α -(Trimethylsilyl)- ω -methylpoly[oxy(dimethylsilylene)]
[9006-65-9].

DEFINITION

Dimethicone is a mixture of fully methylated linear siloxane polymers containing repeating units of the formula:

stabilized with trimethylsiloxy end-blocking units of the formula:

wherein n has an average value such that the corresponding nominal viscosity is in a discrete range between 20 and 30,000 centistokes. It contains NLT 97.0% and NMT 103.0% of polydimethylsiloxane $([-(\text{CH}_3)_2\text{SiO}-]_n)$.

The requirements for viscosity, specific gravity, refractive index, and loss on heating differ for the several types of Dimethicone, as set forth in *Table 1*.

IDENTIFICATION

- **A.** The IR absorption spectrum of the *Sample* exhibits maxima only at the same wavelengths as that of the *Standard*, obtained as directed in the *Assay*.

ASSAY

• PROCEDURE

Standard: USP Polydimethylsiloxane RS

Sample: Dimethicone

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: IR, with a resolution of 4 cm^{-1} and fitted with an accessory for attenuated total reflectance and a germanium (Ge) sample trough (45° or 60°)

Wavelength range: 4000 to 700 cm^{-1}

Analysis

Samples: *Standard* and *Sample*

Using an empty and clean trough, determine the background spectrum. Fill the trough with the *Sample*, and record the spectrum. Clean the trough, fill it with the *Standard*, and determine the spectrum. Examine the spectra in the range between 1300 and 1200 cm^{-1} , and determine the absorbance of the peak in each spectrum at about 1259 cm^{-1} .

Calculate the percentage of polydimethylsiloxane $([-(\text{CH}_3)_2\text{SiO}-]_n)$ in the Dimethicone taken:

$$\text{Result} = (A_U/A_S) \times (D_S/D_U) \times 100$$

A_U = absorbance of the *Sample*

A_S = absorbance of the *Standard*

D_S = specific gravity of USP Polydimethylsiloxane RS

D_U = specific gravity of Dimethicone

Acceptance criteria: 97.0%–103.0%

IMPURITIES

• HEAVY METALS

Standard solution: To 20 mL of chloroform add 1.0 mL of a freshly prepared 0.002% solution of dithizone in chloroform, 0.5 mL of *Standard Lead Solution* (see *Heavy Metals* (231)), and 0.5 mL of a mixture of 1 volume of ammonia TS and 9 volumes of a 0.2% solution of hydroxylamine hydrochloride.

Sample solution: Mix 1.0 g of Dimethicone with 10 mL of chloroform, and dilute with the same solvent to 20 mL. Add 1.0 mL of a freshly prepared 0.002% solution of dithizone in chloroform, 0.5 mL of water, and 0.5 mL of a mixture of 1 volume of ammonia TS and 9 volumes of a 0.2% solution of hydroxylamine hydrochloride.

Analysis: Immediately shake both solutions vigorously for 1 min.

Acceptance criteria: $5\text{ }\mu\text{g/g}$; any red color in the *Sample solution* is not more intense than that in the *Standard solution*.

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): See *Table 1*.

- **REFRACTIVE INDEX** (831): See *Table 1*.

• ACIDITY

Sample: 15.0 g

Analysis: Dissolve the *Sample* in a mixture of 15 mL of toluene and 15 mL of butyl alcohol, previously neutralized to bromophenol blue TS, and titrate with 0.050 N alcoholic potassium hydroxide to a bromophenol blue endpoint.

Acceptance criteria: NMT 0.10 mL of 0.050 N alcoholic potassium hydroxide is required.

• LOSS ON HEATING

Sample: 1 g

Analysis: Preheat an open aluminum vessel (60 mm in diameter and 10 mm high) at 150° for 30 min, and allow to cool to room temperature. Tare the vessel, transfer the *Sample* to it, heat at 150° in a circulating air oven for 2 h, and allow to come to room temperature in a desiccator before weighing.

Acceptance criteria: See *Table 1*.

Table 1

Nominal Viscosity (centistokes)	Viscosity (centistokes)		Specific Gravity		Refractive Index		Loss on Heating (%)
	Min.	Max.	Min.	Max.	Min.	Max.	
20	18	22	0.946	0.954	1.3980	1.4020	20.0
50	47.5	52.5	0.955	0.965	1.4005	1.4045	2.0
100	95	105	0.962	0.970	1.4005	1.4045	0.3
200	190	220	0.964	0.972	1.4013	1.4053	0.3
350	332.5	367.5	0.965	0.973	1.4013	1.4053	0.3
500	475	525	0.967	0.975	1.4013	1.4053	0.3
1000	950	1050	0.967	0.975	1.4013	1.4053	0.3
12,500	11,875	13,125	—	—	1.4015	1.4055	2.0
30,000	27,000	33,000	0.969	0.977	1.4010	1.4100	2.0

- **BACTERIAL ENDOTOXINS TEST (85)** (where it is intended for use in coating containers that come in contact with articles for parenteral use)

Sample: 1.0 mL

Analysis: Mix the *Sample* with 4.0 mL of polydimethylsiloxane having a viscosity of 0.65 centistokes, previously tested and shown to be negative for bacterial endotoxins, by mixing on a vortex mixer for 1 min in an extraction tube. Add 10 mL of water, and mix on a vortex mixer for NLT 60 min. Allow the layers to separate, and use the lower aqueous layer as the sample.

Acceptance criteria: It contains NMT 1.0 USP Endotoxin Unit/mL, equivalent to NMT 10 Endotoxin Units/mL of the Dimethicone taken.

- **VISCOSITY—CAPILLARY VISCOMETER METHODS (911) and ROTATIONAL RHEOMETER METHODS (912)**

Analysis: Determine the viscosity of Dimethicone having a nominal viscosity of less than 1000 centistokes at $25 \pm 0.1^\circ$, using a capillary viscometer. Determine the viscosity of Dimethicone having a nominal viscosity of 1000 centistokes or greater at $25 \pm 0.1^\circ$, using a rotational viscometer.

Acceptance criteria: See *Table 1*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate its nominal viscosity value. Dimethicone intended for use in coating containers that come in contact with articles for parenteral use is so labeled.
- **USP REFERENCE STANDARDS (11)**
USP Endotoxin RS
USP Polydimethylsiloxane RS

Docusate Sodium—see *Docusate Sodium General Monographs*

Edetate Calcium Disodium—see *Edetate Calcium Disodium General Monographs*

Edetate Disodium—see *Edetate Disodium General Monographs*

Edetic Acid

$C_{10}H_{16}N_2O_8$ 292.24
Glycine, *N,N'*-1,2-ethanediylbis[*N*-(carboxymethyl)-; (Ethylenedinitrilo)tetraacetic acid [60-00-4].

DEFINITION

Edetic Acid contains NLT 98.0% and NMT 100.5% of edetic acid ($C_{10}H_{16}N_2O_8$).

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

ASSAY

- **PROCEDURE**

Standard: 200 mg of chelometric standard calcium carbonate, previously dried to 110° for 2 h and cooled in a desiccator

Sample solution: Transfer 1.4 g of Edetic Acid to a 100-mL volumetric flask, dissolve in 11 mL of 1 N sodium hydroxide, dilute with water to volume, with cooling if necessary, and mix.

Analysis: Add 10 mL of water to the *Standard*, swirl to form a slurry, and cover the beaker with a watch glass. Without removing the watch glass, add 2 mL of 3 N hydrochloric acid from a pipet, and swirl to dissolve. Wash down the sides of the container, the outer surface of the pipet, and the watch glass with water, and dilute with water to 100 mL. While stirring with a magnetic stirrer, add 30 mL of the *Sample solution* from a 50-mL buret. Add 10 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue, and continue the titration with the *Sample solution* to a blue endpoint. Calculate the percentage of edetic acid ($C_{10}H_{16}N_2O_8$) in the portion of sample taken:

$$\text{Result} = [W/(V \times C)] \times (M_{r1}/M_{r2}) \times 100$$

W = weight of calcium carbonate (mg)
V = volume of the *Sample solution* consumed in the titration (mL)
C = concentration of the *Sample solution* (mg/mL)
M_{r1} = molecular weight of edetic acid, 292.24
M_{r2} = molecular weight of calcium carbonate, 100.09

Acceptance criteria: 98.0%–100.5%

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%
- **HEAVY METALS, Method II** (231): 30 µg/g
- **IRON**

Sample solution: Char 3.0 g of Edetic Acid thoroughly, and heat in an oven at 500° until most of the carbon is consumed. Cool, add 0.15 mL of nitric acid, and heat at 500° until all of the carbon is consumed. Dissolve the residue in 2 mL of a mixture of equal volumes of hydrochloric acid and water, digest in a covered dish on a steam bath for 10 min, remove the cover, and evaporate to dryness. Dissolve the residue in 1 mL of 1 N acetic acid and 20 mL of hot water, digest for 5 min on a steam bath, cool, and dilute with water to 30 mL.

Control solution: Dissolve 43.2 mg of ferric ammonium sulfate in 10 mL of 2 N sulfuric acid, and add water to make 1000 mL. Each mL contains 5 µg of Fe.

Analysis: To 2.0 mL each of *Sample solution* and *Control solution* add 2 mL of hydrochloric acid, and dilute with water to 50 mL. Add 50 mg of ammonium persulfate and 3 mL of ammonium thiocyanate solution (300 mg/mL), mix, and transfer to a color comparison tube.

Acceptance criteria: 0.005%; the color of the *Sample solution* is not deeper than that of the *Control solution*.

• LIMIT OF NITRILOTRIACETIC ACID

Mobile phase: Add 10 mL of 1.0 M tetrabutylammonium hydroxide in methanol to 200 mL of water, and adjust with 1 M phosphoric acid to a pH of 7.5 ± 0.1 . Transfer the solution so obtained to a 1000-mL volumetric flask, add 90 mL of methanol, dilute with water to volume, mix, and pass through a filter of 0.5-µm pore size.

Solution A: 10 mg/mL of cupric nitrate [Cu(NO₃)₂]

Standard stock solution: Transfer 100 mg of nitrilotriacetic acid to a 10-mL volumetric flask, and add 0.5 mL of ammonium hydroxide. Dilute with water to volume.

Standard solution: Transfer 1.0 g of Edetic Acid to a 100-mL volumetric flask, add 300 µL of *Standard stock solution*, and dilute with *Solution A* to volume. Sonicate, if necessary, to completely dissolve.

System suitability solution: Transfer 10 mg of Edetic Acid to a 100-mL volumetric flask, add 100 µL of *Standard stock solution*, and dilute with *Solution A* to volume. Sonicate, if necessary, to completely dissolve.

Sample solution: 10 mg/mL of Edetic Acid in *Solution A*. Sonicate, if necessary, to completely dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; packing L7

Flow rate: 2 mL/min

Injection volume: 50 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for nitrilotriacetic acid, copper, and edetate are about 0.35, 0.65, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3 between the nitrilotriacetic acid and copper peaks, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: 0.3%; the response of the nitrilotriacetic acid peak of the *Sample solution* does not exceed the difference between the nitrilotriacetic acid

peak responses from the *Standard solution* and the *Sample solution*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Edetic Acid RS

Egg Phospholipids

DEFINITION

Egg Phospholipids is a mixture of naturally occurring phospholipids obtained from the yolk of hens' eggs that is suitable for use as an emulsifying agent in injectable emulsions. The content of phosphatidylcholine, phosphatidylethanolamine, lysophosphatidylcholine, and other related phospholipids is to be reported in the certificate of analysis. It may also contain a suitable stabilizer.

ASSAY

• CONTENT OF PHOSPHOLIPIDS

Solution A: 1341.6 g of *n*-hexane, 334.1 g of 2-propanol, 39.4 g of acetic acid, and 1.45 g of triethylamine (or 2.0 mL triethylamine)

Solution B: 663.5 g of 2-propanol, 140.0 g of water, 15.8 g of acetic acid, and 0.58 g of triethylamine

Solvent: *n*-Hexane, 2-propanol, and water (23:23:4).

[NOTE—To avoid the formation of two phases, mix the 2-propanol and water first, and then add the *n*-hexane.]

Mobile phase: See the gradient table below.

Program Step	Time (min)	Flow (mL/min)	Solution A (%)	Solution B (%)
1	0	1.0	95	5
2	5.0	1.0	80	20
3	8.5	1.0	60	40
4	15.0	1.0	0	100
5	17.5	1.0	0	100
6	17.6	1.0	95	5
7	21.0	1.0	95	5
8	22.0	2.0	95	5
9	27.0	2.0	95	5
10	29.0	1.0	95	5

Standard solutions: Transfer USP Phosphatidylcholine RS, USP Phosphatidylethanolamine RS, and USP Lysophosphatidylcholine RS to separate flasks, dissolve each in *Solvent*, and dilute. *Standard solutions* of five different concentrations are prepared on the basis of the expected content of phosphatidylcholine, phosphatidylethanolamine, and lysophosphatidylcholine in the sample. The *Standard solutions* should cover a range of 60% to 140%. Calculate the concentrations of the Standards:

$$\text{Result} = \text{WP/V}$$

W = weight of the Standard (mg)

P = purity of the designated Reference Standard

V = volume of each of the *Standard solutions* (mL)

Sample solution: 100 mg of Egg Phospholipids in a 25-mL volumetric flask. Dissolve in *Solvent*, and dilute. Calculate the concentration, in mg/mL: this value is used as the sample amount.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: evaporative light-scattering detector

Column: 4-mm × 125-mm; 5-μm packing L20

Column temperature: 55°

Injection size: 20 μL

System suitability

Sample: *Standard solutions*

[NOTE—The relative retention times for phosphatidylcholine, phosphatidylethanolamine, and lysophosphatidylcholine are 1.00, 0.85, and 1.25, respectively.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: Each of the *Standard solutions* and *Sample solution*

Identify the peaks of the relevant analytes in the chromatogram of the *Sample solution* by comparison with the chromatograms obtained from the *Standard solutions*. Measure the areas of the analyte peaks. Plot the logarithms of the relevant responses versus the logarithms of the concentrations, in mg/mL, of each analyte obtained from the *Standard solutions*, and determine the linear regression line using a least-squares analysis. The correlation coefficient for the linear regression line is NLT 0.995. From the graphs so obtained, determine the concentration, *C*, in mg/mL, of the relevant analyte in the *Sample solution*.

Separately calculate the percentages of phosphatidylethanolamine, phosphatidylcholine, and lysophosphatidylcholine in the portion of Egg Phospholipids taken:

$$\text{Result} = (\text{CV}/\text{W}) \times 100$$

C = concentration of the relevant analyte in the *Sample solution* (mg/mL)

V = volume of the relevant analyte in the *Sample solution* (mL)

W = weight of Egg Phospholipids in the *Sample solution* (mg)

Acceptance criteria: NMT 3.0% of lysophosphatidylcholine

IMPURITIES

Inorganic Impurities

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

Organic Impurities

- **PROCEDURE: LIMIT OF NONPHOSPHATIDYL LIPIDS**

Solvent: Diethyl ether

Sample solution: 500 mg of Egg Phospholipids, dissolved in 15 mL of *Solvent*, in a 50-mL conical flask

Chromatographic system

(See *Chromatography* (621), *Column Chromatography*.)

Mode: Column

Chromatographic column: Transfer 1000 g of silica gel having a particle size of 0.05–0.2 mm into a container with well-closing screw caps. Add 150 g of water, shake well, and allow to stand for 24 h. Suspend 15 g of prepared adsorbent in 50 mL of *Solvent*, and introduce into a 1- to 2-cm chromatographic column. Drain the *Solvent* through the column to a level of about 1 cm above the silica gel bed.

Analysis

Sample: *Sample solution*

Transfer the *Sample solution* to the *Chromatographic column*. Rinse the column containing the *Sample solution* with two 15-mL portions of *Solvent*, allowing each rinse to pass through the column before adding the next. After rinsing, elute with 105 mL of *Solvent*. Evaporate the eluate (150 mL) in a tared, round-bottom, 250-mL conical flask to dryness, using a suitable rotary evaporator. The volatiles are blown out with a stream of nitrogen, and the residue is dried at 105° for 20 min. The weight of the residue

gives the oil fraction, determined as nonpolar lipids, in Egg Phospholipids.

Calculate the percentage of the nonphosphatidyl lipids taken:

$$\text{Result} = \text{A}/\text{W} \times 100$$

A = weight of the residue (mg)

W = weight of Egg Phospholipids taken in the *Sample solution* (mg)

Acceptance criteria: NMT 7.0%

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 20.0
- **FATS AND FIXED OILS**, *Peroxide Value* (401): NMT 3
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 6 USP Endotoxin Units/g
- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total microbial count does not exceed 100 cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **WATER DETERMINATION**, *Method I* (921)
Sample: 2 g in 50 mL of anhydrous methyl alcohol
Acceptance criteria: NMT 6.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve under nitrogen in a sealed container, and store at a temperature of –10° or below.
- **USP REFERENCE STANDARDS** (11)
USP Endotoxin RS
USP Phosphatidylcholine RS
USP Phosphatidylethanolamine RS
USP Lysophosphatidylcholine RS

Erythorbic Acid

$\text{C}_6\text{H}_8\text{O}_6$

o-Araboascorbic acid;

D-Erythro-hex-2-enoic acid delta-lactone;

Isoascorbic acid, D-isoascorbic acid [89-65-6].

176.12

DEFINITION

Erythorbic Acid contains NLT 99.0% and NMT 100.5% of $\text{C}_6\text{H}_8\text{O}_6$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

- **B.**

Sample solution: 20 mg/mL of Erythorbic Acid and water

Analysis: To 2 mL of *Sample solution* add a few drops of sodium nitroferricyanide TS and then add 1 mL of 0.1 N sodium hydroxide.

Acceptance criteria: A transient blue color immediately appears.

- **C.**

Analysis: Dissolve about 15 mg of Erythorbic Acid in 15 mL of trichloroacetic acid (1:20). Add about 200 mg of activated charcoal, and shake the mixture vigorously for 1 min. Pass through a small fluted filter, refilter if necessary to obtain a clear filtrate, agitate the mixture until the pyrrole is dissolved, and heat in a water bath at 50°.

Acceptance criteria: A blue color appears.

ASSAY

PROCEDURE

Sample: 400 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N iodine VS

Endpoint detection: Colorimetric

Analysis: Dissolve the *Sample* in a mixture of 100 mL of recently boiled and cooled water and 25 mL of 2 N sulfuric acid. Add 3 mL of starch TS, and titrate at once with 0.1 N iodine VS. Perform a blank determination. Calculate the percentage of erythorbic acid ($C_6H_8O_6$) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = *Titrant* volume consumed by the *Sample* (mL)

B = *Titrant* volume consumed by the *Blank* (mL)

N = *Titrant* actual normality (mEq/mL)

F = equivalency factor, 88.06 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES

RESIDUE ON IGNITION (281): NMT 0.3%

LIMIT OF LEAD

[NOTE—Select reagents having as low a lead content as practicable, and store all solutions in borosilicate glass containers. Rinse all glassware thoroughly with warm 8 N nitric acid followed by deionized water.]

Standard stock solution: Dissolve 160 mg of lead nitrate in 100 mL of water containing 1 mL of nitric acid. Dilute with water to 1000 mL. On the day of use, transfer 10.0 mL of the above solution to a 100-mL volumetric flask, and dilute with water to volume. Each mL of this solution contains the equivalent of about 10 µg of lead.

[NOTE—Prepare the *Standard solutions* on the day of use.]

Standard solution A: 1 µg/mL of lead from the *Standard stock solution*

Standard solution B: 2 µg/mL of lead from the *Standard stock solution*

Standard solution C: 5 µg/mL of lead from the *Standard stock solution*

Sample solution: Transfer a weighed portion of about 10 g of Erythorbic Acid to an evaporating dish. Add 5 mL of 25% sulfuric acid, and distribute the sulfuric acid uniformly through the sample. Within a hood, place the dish on a steam bath to evaporate most of the water. Place the dish on a burner, and slowly pre-ash the sample by expelling most of the sulfuric acid. Place the dish in a muffle furnace at 525°, and ash the sample until the residue appears free from carbon. Cool, and cautiously wash down the inside of the evaporation dish with water. Add 5 mL of 1 N hydrochloric acid. Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N hydrochloric acid and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer quantitatively to a 10-mL volumetric flask, and dilute with water to volume.

Blank: To an evaporating dish add 5 mL of 25% sulfuric acid, and distribute the sulfuric acid uniformly. Within a hood, place the dish on a steam bath to evaporate most of the water. Place the dish on a burner, and expel most of the sulfuric acid. Then place the dish in a muffle furnace at 525° for about the same amount of time as in the *Sample solution* preparation. Cool, and cautiously wash down the inside of the evaporation dish with water. Add 5 mL of 1 N hydrochloric acid.

Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N hydrochloric acid and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer quantitatively to a 10-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption

Lamp: Lead electrodeless discharge

Flame: Air–acetylene

Analytical wavelength: 283.3 nm

Slit width: 0.7 nm

Standard curve

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Blank*

Plot: Corrected absorbance values versus their corresponding concentration (µg/mL). [NOTE—Determine the corrected absorbance values by subtracting the absorbance of the *Blank* from the absorbance of the *Samples*.]

Analysis

Sample: *Sample solution*

From the *Standard curve*, determine the lead concentration in the *Sample solution*. Calculate the lead content, in ppm, in the portion of Erythorbic Acid taken:

$$\text{Result} = V \times C_s / W$$

V = volume of the *Sample solution* (mL)

C_s = concentration of lead in the *Sample solution* (µg/mL)

W = weight of Erythorbic Acid in the *Sample solution* (g)

Acceptance criteria: NMT 10 ppm

SPECIFIC TESTS

OPTICAL ROTATION, Specific Rotation (781S): −16.5° to −18.0°

Sample solution: 100 mg/mL in water

LOSS ON DRYING (731): Dry a sample in a vacuum over silica gel for 3 h: it loses NMT 0.4% of its weight.

ADDITIONAL REQUIREMENTS

PACKAGING AND STORAGE: Preserve in tight, light-resistant containers.

USP REFERENCE STANDARDS (11) USP Erythorbic Acid RS

Erythritol

$C_4H_{10}O_4$

1,2,3,4-Butanetetrol;

Butane 1,2,3,4-tetrol (*meso*-erythritol) [149-32-6].

122.12

DEFINITION

Erythritol is obtained by fermentation of starch enzyme hydrolysate (from starches such as wheat and corn). It is obtained from the fermentation broth of suitable osmophilic yeasts such as *Moniliella pollinis* or *Trichosporonoides megachiliensis*. It contains NLT 96.0% and NMT 102.0% of erythritol ($C_4H_{10}O_4$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. MELTING RANGE OR TEMPERATURE** (741): 119°–123°

ASSAY• **PROCEDURE**

Mobile phase: 0.01% sulfuric acid

System suitability solution: 0.05 mg/mL each of USP Erythritol RS and glycerol

Standard solution: 50 mg/mL of USP Erythritol RS

Sample solution: 50 mg/mL of Erythritol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm × 30-cm; packing L17

Column temperature: 70°

Flow rate: 0.8 mL/min

Injection size: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for erythritol and glycerol are about 1.0 and 1.1, respectively.]

Suitability requirements

Resolution: NLT 2.0 between erythritol and glycerol, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Record chromatograms for over a period of three times the retention time of erythritol.]

Calculate in percentage of erythritol (C₄H₁₀O₄) in the portion of Erythritol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Erythritol RS in the *Standard solution* (mg/mL)

C_U = concentration of Erythritol in the *Sample solution* (mg/mL)

Acceptance criteria: 96.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

• **LIMIT OF LEAD**

Standard lead solution: Prepare as directed under *Heavy Metals* (231), *Special Reagents*.

Sample solution: Dissolve 20.0 g of Erythritol in diluted acetic acid, and dilute with the same medium to 100 mL. Add 2.0 mL of a saturated ammonium pyrrolidinedithiocarbamate solution (10 mg/mL of ammonium pyrrolidinedithiocarbamate) and 10.0 mL of methyl isobutyl ketone, and shake for 30 s. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Standard solutions: Prepare as directed for the *Sample solution*, except prepare three solutions by adding 0.5, 1.0, and 1.5 mL of *Standard lead solution* in addition to the 20.0 g of Erythritol.

Blank solution: Prepare as directed for the *Sample solution*, omitting Erythritol.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry, using methyl isobutyl ketone previously treated as described under *Sample solution*, but without the sample added

Analytical wavelength: 283.3 nm

Lamp: Lead hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Sample solution* and *Standard solutions*

Introduce the *Sample solution* and each of the three *Standard solutions* into the instrument. Record the steady absorbance reading. Plot the absorbance readings against the known concentrations of added lead (in µg), and draw a straight line. Extrapolate the line until it meets the concentration axis, which is equal to the concentration, in ppm, of lead in the sample.

Acceptance criteria: NMT 0.5 ppm

• **RELATED COMPOUNDS**

Mobile phase, System suitability solution, Standard solution, and Sample solution: Proceed as directed in the *Assay*.

Standard solution: Transfer 2.0 mL of the *Standard solution* from the *Assay* to a 100-mL volumetric flask, and dilute with water (1 mg/mL of erythritol).

Chromatographic system: Proceed as directed in the *Assay*, except use an *Injection size* of 20 µL.

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of each impurity found:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response of erythritol from the *Standard solution*

C_S = concentration of USP Erythritol RS in the *Standard solution* (mg/mL)

C_U = concentration of Erythritol in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurities: NMT 2.0%

Total impurities: NMT 2.0%

SPECIFIC TESTS• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR**

SPECIFIED MICROORGANISMS (62): The total aerobic microbial count using the *Plate Method* is NMT 1000 cfu/g, and the total combined molds and yeasts count is NMT 100 cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

- **LOSS ON DRYING** (731): Dry an 8-g sample at 105° for 4 h: it loses NMT 0.2% of its weight.

- **WATER DETERMINATION, Method 1** (921): NMT 0.5%

• **CONDUCTIVITY**

Sample solution: 200 mg/mL in water

Analysis: Using an appropriate conductivity meter, choose a conductivity cell that is appropriate for the properties and conductivity of the solution to be examined. Use a certified reference material,¹ for example, a solution of potassium chloride, that is appropriate for the measurement. The conductivity value of the certified reference material should be near the expected conductivity value of the solution to be examined. After calibrating the apparatus with a certified reference material solution, rinse the conductivity cell several times with water and at least twice with the aqueous solution to be examined. Measure the conductivity of the solution at a temperature of 20° while stirring gently with a magnetic stirrer.

¹ Commercially available conductivity calibration solutions for conductivity meter standardization, standardized by methods traceable to the National Institute of Standards and Technology (NIST), may be used. Solutions prepared according to instructions given in the American Society for Testing and Materials (ASTM) Standard D1125 may be used, provided that the conductivity of the resultant solution is the same as that of the solution prepared from the NIST-certified material.

Acceptance criteria: NMT 20 $\mu\text{S}/\text{cm}$

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)
USP Erythritol RS
meso-Erythritol, 1,2,3,4-butanetetrol.
 $\text{C}_4\text{H}_{10}\text{O}_4$ 122.12

Ethyl Acetate

$\text{C}_4\text{H}_8\text{O}_2$ 88.11
Acetic acid, ethyl ester;
Ethyl acetate [141-78-6].

DEFINITION

Ethyl Acetate contains NLT 99.0% and NMT 100.5% of ethyl acetate ($\text{C}_4\text{H}_8\text{O}_2$).

IDENTIFICATION

- **A.** It is readily volatilized, even at low temperatures, and is flammable. When burned, a yellow flame and acetous odor are produced.

ASSAY

PROCEDURE

Sample: Weigh 1.5 g of Ethyl Acetate in a stoppered weighing bottle.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.5 N sodium hydroxide VS

Back-titrant: 0.5 N hydrochloric acid VS

Blank: 50 mL of 0.5 N sodium hydroxide VS, accurately measured

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a suitable flask. Add 50.0 mL of 0.5 N sodium hydroxide VS, and heat on a steam bath under a reflux condenser for 1 h. Allow to cool, and add phenolphthalein TS. Titrate the excess sodium hydroxide with 0.5 N hydrochloric acid VS. Perform a blank determination.

Calculate the percentage of ethyl acetate ($\text{C}_4\text{H}_8\text{O}_2$) in the *Sample* taken:

$$\text{Result} = \{[(V_B - V_S) \times N \times F] / W\} \times 100$$

V_B = Back-titrant volume consumed by the *Blank* (mL)

V_S = Back-titrant volume consumed by the *Sample* (mL)

N = actual normality of the Back-titrant (mEq/mL)

F = equivalency factor for ethyl acetate, 88.1 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 99.0%–100.5%

IMPURITIES

LIMIT OF NONVOLATILE RESIDUE

Sample: Ethyl Acetate

Analysis: Evaporate the *Sample* in a tared porcelain dish on a steam bath, and dry at 105° for 1 h.

Acceptance criteria: NMT 0.02%

LIMIT OF METHYL COMPOUNDS

Sample: 20 mL of Ethyl Acetate

Analysis: Place the *Sample* in a 500-mL separator. Add a solution of 20 g of sodium hydroxide in 50 mL of water, and insert the stopper in the separator. Wrap it

securely in a towel for protection against the heat of the reaction. Shake the mixture vigorously for about 5 min, cautiously opening the stopcock from time to time to permit the escape of air. Continue shaking vigorously until a homogeneous liquid results, then distill, and collect about 25 mL of the distillate. To 0.05 mL of the distillate add 1 drop of dilute phosphoric acid (1 in 20) and 1 drop of potassium permanganate solution (1 in 20). Mix, allow to stand for 1 min, and add sodium bisulfite solution (1 in 20), dropwise, until the permanganate color is discharged. If a brown color remains, add 1 drop of the dilute phosphoric acid. To the colorless solution add 5 mL of freshly prepared chromotropic acid TS, and heat on a steam bath at 60° for 10 min.

Acceptance criteria: No violet color appears.

CHROMATOGRAPHIC PURITY

System suitability solution: Chloroform, ethyl acetate, isobutyl acetate, and *n*-butyl acetate (3:1:1:1)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 1.8-m \times 4-mm; support S11

Column temperature: See *Table 1*.

Table 1

Initial Temperature (°)	Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
115	—	115	6
115	16	200	15

System suitability

Sample: 0.1 μL of *System suitability solution*

[NOTE—The retention times for chloroform, isobutyl acetate, and *n*-butyl are 0.9, 2.7, and 2.8, respectively, relative to ethyl acetate as 1.0.]

Suitability requirements

Resolution: NLT 1.3 between the chloroform and ethyl acetate peaks; NLT 1.5 between the isobutyl acetate and *n*-butyl acetate peaks

Tailing factor: NMT 1.5 for the ethyl acetate peak

Analysis

Sample: Ethyl Acetate (neat)

Inject about 0.06 μL using a 1- μL syringe.

Acceptance criteria: The area of the ethyl acetate peak is NLT 99.5% of the sum of the areas of all the peaks.

SPECIFIC TESTS

ACIDITY

Sample solution: 2.0 mL of Ethyl Acetate in 10 mL of neutralized alcohol

Analysis: Add 2 drops of phenolphthalein TS to the *Sample solution*. Neutralize with 0.10 N sodium hydroxide.

Acceptance criteria: NMT 0.10 mL of 0.10 N sodium hydroxide is required.

READILY CARBONIZABLE SUBSTANCES TEST (271)

Sample: 2 mL of Ethyl Acetate

Analysis: Add the *Sample* carefully to 10 mL of sulfuric acid to form separate layers.

Acceptance criteria: No dark zone is developed within 15 min.

SPECIFIC GRAVITY (841): 0.894–0.898

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and avoid exposure to excessive heat.

Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion

[9010-88-2].

DEFINITION

Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion is an aqueous dispersion of a copolymer of ethyl acrylate and methyl methacrylate having an average molecular weight of about 800,000. It may contain suitable emulsifying agents.

IDENTIFICATION

• INFRARED ABSORPTION (197)

Analysis: Place 1 drop of Dispersion on a glass plate,¹ and cover the test substance with a water-resistant crystal disk (silver chloride or KRS-5).² Gently press on and then remove the crystal disk. Dry the crystal disk at 80° for approximately 15 min.

Acceptance criteria: The IR absorption spectrum of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion exhibits maxima corresponding to the same wavelengths as those of a similar preparation of USP Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion RS treated in the same manner.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION (281):** Using mild heating conditions (e.g., steam bath, sand bath) to avoid loss of material, evaporate the Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion to dryness before ignition: NMT 0.4% residue is obtained, calculated on the undried basis.

Organic Impurities

• PROCEDURE: LIMIT OF MONOMERS

Solution A: 35 mg/mL of sodium perchlorate

Solution B: Dilute phosphoric acid with water to obtain a solution having a pH of 2.0.

Mobile phase: *Solution B* and methanol (4:1)

Standard solution: Prepare a solution in tetrahydrofuran having a concentration of 2 µg/mL each of ethyl acrylate and methyl methacrylate. To 10.0 mL of this solution add 5.0 mL of *Solution A*, and mix. Dilute 5.0 mL of the mixture with water to 10.0 mL, and mix. The solution contains a concentration of 0.67 µg/mL each of ethyl acrylate and methyl methacrylate.

Sample stock solution: 20 mg/mL of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion in tetrahydrofuran

Sample solution: To 5.0 mL of *Solution A* add 10.0 mL of *Sample stock solution*, dropwise, while stirring continuously. Centrifuge, and filter the clear supernatant. Dilute 5.0 mL of the clear supernatant with water to 10.0 mL, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 12.0-cm; packing L1

Flow rate: 2 mL/min

Injection size: 50 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between ethyl acrylate and methyl methacrylate

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each monomer in the portion of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times D \times F \times 100$$

r_U = peak response of each monomer from the *Sample solution*

r_S = peak response of each monomer from the *Standard solution*

C_S = concentration of each monomer in the *Standard solution* (µg/mL)

C_U = concentration of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion in the *Sample stock solution* (mg/mL)

D = dilution factor for the preparation of the *Sample solution* from the *Sample stock solution*, 3

F = unit conversion factor, 10^{-3} mg/µg

Total impurities: NMT 0.01% of total monomers

SPECIFIC TESTS

• MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):

The total aerobic microbial count does not exceed 1000 cfu/g, and the total yeasts and molds count does not exceed 100 cfu/g.

• PH (791): 5.5–8.6

• **LOSS ON DRYING (731):** Dry a sample at 110° for 3 h: it loses between 68.5% and 71.5% of its weight.

• **ROTATIONAL RHEOMETER METHODS (912):** Equip a suitable rotational viscometer with an adapter comprising a cylindrical spindle rotating within an accurately machined chamber (or tube).³ Mix the Dispersion, pipet the test specimen in the specified volume, which is recommended by the instrument manufacturer, into the chamber (or tube), and ensure that the temperature of the test specimen is at $20 \pm 0.1^\circ$. The shear rate under the test condition is NLT 1 s^{-1} and NMT 100 s^{-1} .⁴ Measure the apparent viscosity, following the instrument manufacturer's directions.

Acceptance criteria: The viscosity is between 2 and 20 mPa · s.

• COAGULUM

Sample: 100 g of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion

Analysis: Weigh a stainless steel sieve having 125-µm openings or a suitable single-woven wire cloth with a mesh width of 125 µm, and filter the *Sample* through it. [NOTE—Suitable single-woven wire cloth mesh meets the requirements set in ISO 9044.]

Wash the sieve or the cloth with distilled water until a clear filtrate is obtained, and dry the sieve or the cloth to constant weight at 105°.

Acceptance criteria: The weight of the residue does not exceed 1000 mg (1%).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store between 5° and 25°, with excursions permitted up to 30°. Do not freeze.

• **LABELING:** Label it to indicate the name and quantity of any added emulsifiers.

• USP REFERENCE STANDARDS (11)

USP Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion RS

¹A simple glass microscope slide is suitable.

²KRS-5 consists of 42% thallium(I) bromide and 58% thallium(I) iodine by molecular weight. Suitable disks of silver chloride and of KRS-5 are available from www.photonic.saint-gobain.com, www.almazoptics.com, and www.internationalcrystal.net.

³A commercial device is available from Brookfield as an ultra-low (UL) viscosity adapter. The adapter comprises a 0.4-cm diameter shaft, an accurately machined chamber (or tube) with an internal diameter of 2.8 cm and a depth of 13.5 cm, and a cylindrical spindle 2.5 cm in diameter and 9.1 cm in height.

⁴The cylindrical spindle rotates at 30 rpm.

Ethyl Maltol

$C_7H_8O_3$ 140.14
 2-Ethyl-3-hydroxy-4-pyrone;
 2-Ethyl-3-hydroxy-4H-pyran-4-one;
 2-Ethyl pyromeconic acid [4940-11-8].

DEFINITION

Ethyl Maltol contains NLT 99.0% of $C_7H_8O_3$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197S): 1:50 solution in chloroform

ASSAY

• PROCEDURE

Standard solution: 10.0 $\mu\text{g/mL}$ of USP Ethyl Maltol RS in 0.1 N hydrochloric acid

Sample solution: 10.0 $\mu\text{g/mL}$ of Ethyl Maltol in 0.1 N hydrochloric acid

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Analytical wavelength: 276 nm

Cell: 1 cm

Blank: 0.1 N hydrochloric acid

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ethyl maltol ($C_7H_8O_3$) in the portion of Ethyl Maltol taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Ethyl Maltol RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Ethyl Maltol in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: NLT 99.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2% at 800° for 15 min

SPECIFIC TESTS

- **WATER DETERMINATION, Method I** (921): NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
 USP Ethyl Maltol RS

Ethyl Oleate

$C_{20}H_{38}O_2$ 310.51

9-Octadecenoic acid, (Z)-, ethyl ester;
 Ethyl oleate [111-62-6].

DEFINITION

Ethyl Oleate consists of esters of ethyl alcohol and high molecular weight fatty acids, principally oleic acid.

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 0.866–0.874 at 20°
- **VISCOSITY—CAPILLARY VISCOMETER METHODS** (911) and **ROTATIONAL RHEOMETER METHODS** (912): NLT 5.15 centipoises
- **FATS AND FIXED OILS, Acid Value** (401): NMT 0.5
- **FATS AND FIXED OILS, Iodine Value** (401): 75–85
- **FATS AND FIXED OILS, Saponification Value** (401): 177–188
- **REFRACTIVE INDEX** (831): 1.443–1.450

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Ethyl Vanillin

$C_9H_{10}O_3$ 166.17
 Benzaldehyde, 3-ethoxy-4-hydroxy-;
 3-Ethoxy-4-hydroxybenzaldehyde [121-32-4].

DEFINITION

Ethyl Vanillin, dried over phosphorus pentoxide for 4 h, contains NLT 98.0% and NMT 101.0% of $C_9H_{10}O_3$.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)
Sample solution: 8 $\mu\text{g/mL}$ in methanol
Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: 300 mg of Ethyl Vanillin (previously dried)

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N sodium methoxide VS

Blank: 50 mL of dimethylformamide, accurately measured

Endpoint detection: Visual

Analysis: Transfer the *Sample solution* to a 125-mL conical flask, and dissolve in 50 mL of dimethylformamide. Add thymol blue TS and titrate, using a magnetic stirrer and taking precautions against the absorption of atmospheric carbon dioxide. Perform a blank determination. Calculate the percentage of ethyl vanillin ($C_9H_{10}O_3$) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 166.2 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 98.0%–101.0% on the previously dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 76°–78°
- **LOSS ON DRYING** (731): Dry a sample over phosphorus pentoxide for 4 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Ethyl Vanillin RS

Ethylcellulose

Cellulose, ethyl ether;
Cellulose ethyl ether [9004-57-3].

DEFINITION

Ethylcellulose is a partly O-ethylated cellulose. It contains NLT 44.0% and NMT 51.0% of ethoxy (–OC₂H₅) groups, calculated on the dried basis.

IDENTIFICATION

- **INFRARED ABSORPTION** (197K)

ASSAY

- **PROCEDURE** [NOTE—Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps of the *Sample solution* preparation and the *Standard solution* preparation in a properly functioning hood.]

Internal standard solution: Dilute 120 µL of toluene with o-xylene to 10 mL.

Standard solution: Transfer 100.0 mg of adipic acid, 4.0 mL of the *Internal standard solution*, and 4.0 mL of hydriodic acid into a suitable 10-mL thick-walled reaction vial with a pressure-tight septum closure. Close the vial tightly, and weigh the vial and contents accurately. Afterwards inject 50 µL of iodoethane through the septum with a syringe, weigh the vial again, and calculate the mass of iodoethane added, by difference. Shake well, and allow the layers to separate. Use the upper layer for analysis.

Sample solution: Transfer 50.0 mg of Ethylcellulose, 50 mg of adipic acid, and 2.0 mL of the *Internal standard solution* into a suitable 5-mL thick-walled reaction vial with a pressure-tight septum closure. Cautiously add 2.0 mL of hydriodic acid, immediately close the vial tightly, and weigh the contents and the vial accurately. Shake the vial for 30 s, heat to 125° for 10 min, allow to cool for 2 min, shake again for 30 s, and heat to 125° for 10 min. Afterwards allow to cool for 2 min, and repeat shaking and heating for a third time. Allow the vial to cool for 45 min, and reweigh. If the loss is greater than 10 mg, discard the mixture and prepare another. Use the upper layer for analysis.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 5.0-m stainless steel column packed with 3% G2 on 150–180-µm mesh support S1A

Temperature

Column: 80°

Injector: 200°

Detector: 200°

Carrier gas: Nitrogen

Flow rate: 15 mL/min

Injection volume: 1 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for iodoethane, toluene, and o-xylene are 0.6, 1.0, and 2.3, respectively.]

Suitability requirements

Resolution: NLT 2.0 between iodoethane and toluene

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ethoxy content of the Ethylcellulose as declared in the labeling:

$$\text{Result} = (451,000/312) \times (R_U \times m_2) / [(R_S \times m_1) \times (100 - d)]$$

R_U = ratio of the iodoethane peak area to the toluene peak area from the *Sample solution*

m_2 = mass of iodoethane used in the *Standard solution* (mg)

R_S = ratio of the iodoethane peak area to the toluene peak area from the *Standard solution*

m_1 = mass of Ethylcellulose used in the *Sample solution* (mg)

d = loss on drying as a percentage

Acceptance criteria: 44.0%–51.0% on the dried basis

IMPURITIES**Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.5%, determined on 1.0 g

- **HEAVY METALS, Method II** (231): NMT 20 ppm

CHLORIDES

Solution A: Nitric acid in water (1 in 5)

Standard stock solution: 0.824 mg/mL of sodium chloride

Standard solution: 8.24 µg/mL of sodium chloride, prepared from the *Standard stock solution*. [NOTE—Prepare immediately before use.]

Sample solution: Disperse 250 mg in 50 mL of water, heat to boiling, and allow to cool, shaking occasionally. Filter, and discard the first 10 mL of the filtrate.

Analysis

Samples: *Standard solution* and *Sample solution*

Separately dilute 10 mL of the *Sample solution* and *Standard solution* with water to 15 mL, add 1 mL of *Solution A*, and pour the mixtures as a single addition into test tubes containing 1 mL of 0.1 N silver nitrate VS. Examine the tubes laterally against a black background.

Acceptance criteria: After standing for 5 min protected from light, any opalescence in the *Sample solution* is not more intense than that in the *Standard solution* (0.1%).

Organic Impurities**• PROCEDURE: ACETALDEHYDE**

Solution A: 0.5 mg/mL of methylbenzothiazolone hydrazone hydrochloride

Solution B: 10 mg/mL of ferric chloride and 10 mg/mL of sulfamic acid

Standard stock solution: 10 mg/mL of acetaldehyde in 2-propanol. [NOTE—Use immediately.]

[NOTE—Prepare the *Standard solution* and *Sample solution* at the same time.]

Standard solution: 3 µg/mL of acetaldehyde from the *Standard stock solution* in water. [NOTE—Use immediately.]

Sample solution: Dissolve 3.0 g of ethylcellulose in 10 mL of water, stir by mechanical means for 1 h,

allow to stand for 24 h, filter, and dilute the filtrate with water to 100.0 mL.

Analysis

Samples: *Standard solution* and *Sample solution*

Transfer 5.0 mL of the *Sample solution* and *Standard solution* to separate flasks. To each flask add 5 mL of *Solution A*, and heat in a water bath at 60° for 5 min. Add 2 mL of *Solution B*, and heat again at 60° for 5 min. Cool, and dilute with water to 25.0 mL.

Acceptance criteria: The *Sample solution* is not more intensely colored than the *Standard solution*.

SPECIFIC TESTS

• VISCOSITY—CAPILLARY VISCOMETER METHODS (911)

Solution A: Alcohol and toluene (1:4 w/w)

Sample solution: Shake a quantity of Ethylcellulose, equivalent to 5.00 g of the dried substance, with 95 g of *Solution A* until the substance is dissolved.

Analysis: Determine the viscosity using a capillary viscometer.

Acceptance criteria: The viscosity (mPa · s) determined at 25° is NLT 80.0% and NMT 120.0% of that stated on the label for a nominal viscosity greater than 6 mPa · s; and NLT 75.0% and NMT 140.0% of that stated on the label for a nominal viscosity of NMT 6 mPa · s.

• ACIDITY OR ALKALINITY

Solution A: Dissolve 100 mg of phenolphthalein in 80 mL of alcohol, and dilute with water to 100 mL.

Solution B: Dilute 50 mg of methyl red with 1.86 mL of 0.1 N sodium hydroxide and 50 mL of alcohol, and dilute with water to 100 mL.

Sample solution: To 0.5 g of Ethylcellulose add 25 mL of carbon dioxide-free water, and shake for 15 min. Pass through a sintered-glass filter with a maximum diameter of pores between 16 and 40 µm.

Analysis: To 10 mL of *Sample solution* add 0.1 mL of *Solution A* and 0.5 mL of 0.01 N sodium hydroxide (*Solution C*). To 10 mL of *Sample solution* add 0.1 mL of *Solution B* and 0.5 mL of 0.01 N hydrochloric acid (*Solution D*).

Acceptance criteria: *Solution C* is pink; *Solution D* is red.

• LOSS ON DRYING (731):

Dry a sample at 105° for 2 h: it loses NMT 3.0% of its weight.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in well-closed containers.

• LABELING:

Label it to indicate its nominal viscosity in mPa · s for a 5% m/m solution.

• USP REFERENCE STANDARDS (11)

USP Ethylcellulose RS

Analysis: Transfer a few mL of the *Standard solution* and the *Sample solution* to two separate silver chloride plates, and evaporate.

Acceptance criteria: The IR absorption spectrum of the residue in the regions 3600 to 2600 cm⁻¹ and 1500 to 800 cm⁻¹ exhibits maxima only at the same wavenumbers as that of a film of USP Ethylcellulose RS.

• B.

Sample: 2 mL

Analysis: Transfer the *Sample* to a Petri dish, 100 mm in diameter, so that the bottom of the dish is covered uniformly. Place the dish in an oven or on a hot plate to evaporate the water.

Acceptance criteria: A transparent film results.

• C.

Sample solution: Dissolve the film formed in *Identification test B* in 20 mL of chloroform.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 1.8-m; 10% liquid phase G1 on support S1A

Temperatures

Injection port: 250°

Detector: 275°

Column: 220°

Injection volume: 2 µL

Acceptance criteria: The retention time of the major peak following the solvent peak from the sample corresponds to that from a similar solution of USP Cetyl Alcohol RS.

• D.

Indicator solution: To a 150-mL graduated beaker containing 0.7 mL of sulfuric acid and 5 g of anhydrous sodium sulfate slowly add water to the 90-mL mark. Add methylene blue solution (3 in 1000) to the 100-mL mark.

Analysis: To 1 mL of Dispersion in a 100-mL graduated mixing cylinder add 9 mL of water followed by 25 mL of *Indicator solution*. Add 15 mL of chloroform, and shake vigorously. Allow the two phases to separate.

Acceptance criteria: The lower phase is blue, indicating the presence of sodium lauryl sulfate.

ASSAY

• PROCEDURE

Sample solution: Dispersion equivalent to 25 mg of ethylcellulose

Analysis: Determine the ethoxy content, as directed in *Methoxy Determination* (431). Calculate the ethylcellulose content from the ethoxy content found, and calculate the ethoxy content of the ethylcellulose as declared in the labeling. Each mL of 0.1 N sodium thiosulfate is equivalent to 0.7510 mg of (–OC₂H₅).

Acceptance criteria: 90.0%–110.0%

IMPURITIES

• HEAVY METALS, Method II (231):

NMT 10 µg/g

SPECIFIC TESTS

• ROTATIONAL RHEOMETER METHODS (912)

Sample: Neat

Analysis: Use a rotational viscometer equipped with a low-viscosity adapter. Mix the *Sample*, and pipet 20 mL of it into the low-viscosity small sample adapter. Start the viscometer, and take readings after 60, 90, and 120 s at a temperature of 25 ± 2° and at a spindle speed that results in readings of 10%–90% of full-scale. Multiply the average of the three readings by the factor specified for the selected spindle speed to obtain the viscosity in centipoises.

Ethylcellulose Aqueous Dispersion

DEFINITION

Ethylcellulose Aqueous Dispersion is a colloidal dispersion of Ethylcellulose in water. It contains NLT 90.0% and NMT 110.0% of the labeled amount of ethylcellulose. It contains suitable amounts of Cetyl Alcohol and Sodium Lauryl Sulfate, which assist in the formation and stabilization of the dispersion. It may contain suitable antifoaming and antimicrobial agents.

IDENTIFICATION

• A.

Diluent: Toluene and alcohol (80:20)

Standard solution: 250 mg of USP Ethylcellulose RS in 5 mL of *Diluent*

Sample solution: A small quantity of Dispersion in 5 mL of *Diluent*

- Acceptance criteria: NMT 150 centipoises
- **PH** (791): 4.0–7.0
- **LOSS ON DRYING** (731)
Sample: 5 mL
Analysis: Place 10 g of standard 20- to 30-mesh sand, previously dried for at least 30 min at 60°, into a tared Petri dish. Add the *Sample*, and again weigh. Dry at 60° to constant weight.
- Acceptance criteria: NMT 71.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and protect from freezing.
- **LABELING:** The labeling states the ethoxy content of the ethylcellulose and the percentage of ethylcellulose. The labeling also states the names and quantities of any added antifoaming and antimicrobial agents.
- **USP REFERENCE STANDARDS** (11)
USP Cetyl Alcohol RS
USP Ethylcellulose RS

Ethylcellulose Dispersion Type B

DEFINITION

A stabilized dispersion of ethylcellulose in water. It contains NLT 90.0% and NMT 110.0% of the labeled amount of Ethylcellulose. It may contain suitable amounts of plasticizers, stabilizers, and glidants.

IDENTIFICATION

- **A. FILM FORMATION**
Analysis: Transfer an appropriate quantity of Ethylcellulose Dispersion Type B to a clear glass plate, distribute evenly, and place in a laboratory oven at about 60° until dry. [NOTE—It may take less than 60 min.]
Acceptance criteria: A continuous transparent or translucent film is formed.
- **B. INFRARED ABSORPTION**
Analysis: Use the film prepared in *Identification* test A and perform *Infrared Absorption* (197A).
Standard spectrum: Perform *Infrared Absorption* (197A) using USP Ethylcellulose RS.
Acceptance criteria: The IR absorption spectrum of the film so formed in the 3600–2600 cm⁻¹ and 1500–800 cm⁻¹ regions exhibits maxima corresponding to the same wave numbers as the *Standard spectrum*.
- **C.** The retention time of the ethylcellulose peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. [NOTE—Plasticizer and/or stabilizer peaks may be present in the chromatogram.]

ASSAY

- **PROCEDURE**
Mobile phase: Tetrahydrofuran
Standard solution: Transfer 375 mg of USP Ethylcellulose RS to a 100-mL volumetric flask, and add 70 mL of tetrahydrofuran. Shake by mechanical means until the ethylcellulose is dissolved, and dilute with tetrahydrofuran to volume. The *Standard solution* contains 3.75 mg/mL of USP Ethylcellulose RS.
Sample solution: Add 30 mL of tetrahydrofuran to 1.0 g of Ethylcellulose Dispersion Type B in a 50-mL volumetric flask, and mix the mixture on a suitable shaker for 15 min. Dilute with tetrahydrofuran to volume, and mix. The *Sample solution* contains 20 mg/mL of Ethylcellulose Dispersion Type B in tetrahydrofuran. [NOTE—If Ethylcellulose Dispersion Type B contains inorganic insoluble material, a portion of the *Sample solution* should be centrifuged at 15,800 × g for NLT 15 min.]
Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 8.0-mm × 30-cm; 6-μm packing L21

Temperature

Detector: 45°

Column: 45°

Flow rate: 0.5 mL/min

Injection size: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0% determined for the ethylcellulose peak

Tailing factor: NMT 2.0 for the ethylcellulose peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ethylcellulose in the portion of Ethylcellulose Dispersion Type B taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ethylcellulose from the *Sample solution*

r_S = peak response of ethylcellulose from the *Standard solution*

C_S = concentration of USP Ethylcellulose RS in the *Standard solution* (mg/mL)

C_U = concentration of Ethylcellulose Dispersion Type B in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

[NOTE—Perform the test for individual plasticizers, stabilizers, or glidants only if they are included in the *Labeling*.]

• CONTENT OF MEDIUM-CHAIN TRIGLYCERIDES

Mobile phase, *Sample solution*, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: Transfer 375 mg of USP Ethylcellulose RS, 60 mg of medium-chain triglycerides, and 40 mg of oleic acid to a 100-mL volumetric flask. Add 70 mL of tetrahydrofuran, and shake by mechanical means until the ethylcellulose is dissolved. Dilute with tetrahydrofuran to volume. The *Standard solution* contains 3.75 mg/mL of USP Ethylcellulose RS, 0.6 mg/mL of medium-chain triglycerides, and 0.4 mg/mL of oleic acid. [NOTE—Oleic acid is included in the *Standard solution* to assist with consistent integration between *Standard* and *Sample solutions*.]

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for ethylcellulose, medium-chain triglycerides, and oleic acid are 1.00, 1.18, and 1.25, respectively.]

Suitability requirements

Relative standard deviation: NMT 5.0% determined for the medium-chain triglycerides peak

Resolution: NLT 2.0 between ethylcellulose and medium-chain triglycerides

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of medium-chain triglycerides in the portion of Ethylcellulose Dispersion Type B taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of medium-chain triglycerides from the *Sample solution*

r_S = peak response of medium-chain triglycerides from the *Standard solution*

C_S = concentration of medium-chain triglycerides in the *Standard solution* (mg/mL)

C_U = concentration of Ethylcellulose Dispersion Type B in the *Sample solution* (mg/mL)

Acceptance criteria: The percentage content of medium-chain triglycerides falls within the quantity range indicated by the *Labeling*. The ratio of medium-chain triglycerides to ethylcellulose is less than 0.25.

• **CONTENT OF OLEIC ACID**

Standard solution: 1.68 mg/mL of USP Oleic Acid RS in tetrahydrofuran

Sample solution: Add 15 mL of tetrahydrofuran to 2.0 g of Ethylcellulose Dispersion Type B in a 25-mL volumetric flask, and mix the mixture on a suitable shaker for 15 min. Dilute with tetrahydrofuran to volume, and mix. The *Sample solution* contains 80 mg/mL of Ethylcellulose Dispersion Type B in tetrahydrofuran.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m capillary column; 0.25-μm layer of phase G25 (or G35)

Temperature

Detector: 280°

Injector port: 280°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
120	—	120	5
120	10	250	20

Carrier gas: Helium

Flow rate: 7.0 mL/min

Injection size: 1.0 μL

Injection type: Splitless

System suitability

Sample: *Standard solution*

[NOTE—The retention time for oleic acid is about 18.5 min.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oleic acid in the portion of Ethylcellulose Dispersion Type B taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of oleic acid from the *Sample solution*

r_S = peak response of oleic acid from the *Standard solution*

C_S = concentration of USP Oleic Acid RS in the *Standard solution* (mg/mL)

C_U = concentration of Ethylcellulose Dispersion Type B in the *Sample solution* (mg/mL)

Acceptance criteria: The percentage content of oleic acid falls within the quantity range indicated by the *Labeling*. The ratio of oleic acid to ethylcellulose is less than 0.15.

• **CONTENT OF DIBUTYL SEBACATE AND OLEIC ACID**

Standard solution: 0.74 mg/mL of USP Dibutyl Sebacate RS and 0.48 mg/mL of USP Oleic Acid RS in tetrahydrofuran

Sample solution: Add 25 mL of tetrahydrofuran to 1.0 g of Ethylcellulose Dispersion Type B in a 50-mL volumetric flask, and mix the mixture on a suitable shaker for 15 min. Dilute with tetrahydrofuran to volume, and mix. The *Sample solution* contains 20 mg/mL of Ethylcellulose Dispersion Type B in tetrahydrofuran. [NOTE—If Ethylcellulose Dispersion Type B contains inorganic insoluble material, a portion

of the *Sample solution* should be centrifuged at 15,800 × *g* for NLT 15 min.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 15-m capillary column; 0.1-μm layer of phase G25 (or G35)

Temperature

Detector: 280°

Injector port: 280°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	—	150	2
150	10	250	10

Carrier gas: Helium

Flow rate: 5.0 mL/min

Injection size: 0.5 μL

Injection type: Split (ratio about 10:1)

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for dibutyl sebacate and oleic acid are 1.00 and 1.45, respectively.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Resolution: NLT 2.0 between dibutyl sebacate and oleic acid

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each component (dibutyl sebacate or oleic acid) in the portion of Ethylcellulose Dispersion Type B taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each component (dibutyl sebacate or oleic acid) from the *Sample solution*

r_S = peak response of each component (dibutyl sebacate or oleic acid) from the *Standard solution*

C_S = concentration of each component (USP Dibutyl Sebacate RS or USP Oleic Acid RS) in the *Standard solution* (mg/mL)

C_U = concentration of Ethylcellulose Dispersion Type B in the *Sample solution* (mg/mL)

Acceptance criteria

Dibutyl sebacate: The percentage content falls within the quantity range indicated by the *Labeling*. The ratio of dibutyl sebacate to ethylcellulose is less than 0.25.

Oleic acid: The percentage content falls within the quantity range indicated by the *Labeling*. The ratio of oleic acid to ethylcellulose is less than 0.15.

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION** <281>: NMT 1.95%. [NOTE—Perform this test only if Ethylcellulose Dispersion Type B contains inorganic nonvolatile material.]

Organic Impurities

• **PROCEDURE 1: LIMIT OF GLYCERIN**

[NOTE—Perform this test only if Ethylcellulose Dispersion Type B contains glycerides.]

Standard solution: 0.05 mg/mL of USP Glycerin RS in methanol

Sample solution: Add 15 mL of methanol to 2.0 g of Ethylcellulose Dispersion Type B in a 25-mL volumetric flask, and mix the mixture on a suitable shaker for 15 min. Dilute with methanol to volume, and mix. The

Sample solution contains 80 mg/mL of Ethylcellulose Dispersion Type B in methanol.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m capillary column; 3.0-μm layer of phase G43

Temperature

Detector: 280°

Injector port: 280°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
120	10	150	2
150	15	240	20

Carrier gas: Helium

Flow rate: 10.0 mL/min

Injection size: 1.0 μL

Injection type: Splitless

System suitability

Sample: *Standard solution*

[NOTE—The retention time for glycerin is about 3.8 min.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Tailing factor: NMT 2.5

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of glycerin in the portion of Ethylcellulose Dispersion Type B taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of glycerin from the *Sample solution*

r_S = peak response of glycerin from the *Standard solution*

C_S = concentration of USP Glycerin RS in the *Standard solution* (mg/mL)

C_U = concentration of Ethylcellulose Dispersion Type B in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.6%

• PROCEDURE 2: LIMIT OF 1-BUTANOL

[NOTE—Perform this test only if Ethylcellulose Dispersion Type B contains butyl esters.]

Standard solution: 0.1 mg/mL of USP 1-Butanol RS in methanol

Sample solution: Add 15 mL of methanol to 2.0 g of Ethylcellulose Dispersion Type B in a 25-mL volumetric flask, and mix the mixture on a suitable shaker for 15 min. Dilute with methanol to volume, and mix. The *Sample solution* contains 80 mg/mL of Ethylcellulose Dispersion Type B in methanol. [NOTE—If Ethylcellulose Dispersion Type B contains inorganic insoluble material, a portion of the *Sample solution* should be centrifuged at $15,800 \times g$ for 30 min.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m capillary column; 1.0-μm layer of phase G16

Temperature

Detector: 250°

Injector port: 250°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
45	—	45	5
45	10	80	—
80	20	220	10

Carrier gas: Helium

Flow rate: 10.0 mL/min

Injection size: 0.5 μL

Injection type: Splitless

System suitability

Sample: *Standard solution*

[NOTE—The retention time for 1-butanol is about 7.8 min.]

Suitability requirements

Relative standard deviation: NMT 5.0%

Tailing factor: NMT 2.0

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of 1-butanol in the portion of Ethylcellulose Dispersion Type B taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of 1-butanol from the *Sample solution*

r_S = peak response of 1-butanol from the *Standard solution*

C_S = concentration of USP 1-Butanol RS in the *Standard solution* (mg/mL)

C_U = concentration of Ethylcellulose Dispersion Type B in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.2%

SPECIFIC TESTS

• pH (791): 9.5–11.5

• TOTAL SOLIDS

Analysis: Place 3 g (4 mm in diameter) of glass beads in an aluminum dish, and weigh. Add 10 g of Ethylcellulose Dispersion Type B, and again weigh. Dry at about 105° for 3 h. Determine the percentage of total solids in Ethylcellulose Dispersion Type B.

Acceptance criteria: 23.0%–26.0%

• ROTATIONAL RHEOMETER METHODS (912)

Sample: 500 mL of Ethylcellulose Dispersion Type B

Analysis: Transfer the *Sample* to a beaker with an inside diameter of 83 mm. Place the beaker in a water bath, cover with a watchglass, allow to equilibrate at $25 \pm 0.1^\circ$, and let air bubbles dissipate. Keep the sample free from entrapped air bubbles and uniform in temperature. Stir the dispersion in the beaker at low agitation speed to ensure homogeneity, making sure that no air bubbles are incorporated. Determine viscosity at $25 \pm 0.1^\circ$, using a suitable rotational viscometer with a spindle having a cylinder 4.7 cm in diameter and 0.2 cm high attached to a shaft 0.3 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 2.7 cm, and the immersion depth being 4.9 cm.¹ Operate the viscometer at 20 rpm. Follow the instrument manufacturer's directions to measure the apparent viscosity.

¹ A commercial instrument is available as an RV2 spindle from Brookfield.

Acceptance criteria: 400–1500 mPa · s

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers at a temperature below 25°. Protect from freezing.
- **LABELING:** The labeling states the percentage of ethylcellulose. Label it to indicate the names and quantity ranges of any added plasticizers, stabilizers, and glidants. Label it to indicate whether any fatty acid components, or fatty acid-containing components are derived from animal, vegetable, or synthetic sources.
- **USP REFERENCE STANDARDS** (11)
 - USP 1-Butanol RS

Ethylene Glycol and Vinyl Alcohol Graft Copolymer

Polyethylene glycol-graft-polyvinyl alcohol;
Graft-copoly(ethylene glycol-vinyl alcohol) [121786-16-1].

DEFINITION

Ethylene Glycol and Vinyl Alcohol Graft Copolymer is a graft copolymer of ethylene glycol and vinyl alcohol. It consists of about 75% of vinyl alcohol ($-\text{CH}_2\text{CH}(\text{OH})-$) units and 25% of ethylene glycol ($-\text{CH}_2\text{CH}_2\text{O}-$) units. The Copolymer is produced by using polyethylene glycol and vinyl acetate as starting materials. Polyethylene glycol forms the polymer backbone on which polyvinyl acetate is grafted. Hydrolysis of polyvinyl acetate side chains leads to formation of polyvinyl alcohol grafted chains. Ethylene Glycol and Vinyl Alcohol Graft Copolymer may contain glidant to improve flowability.

IDENTIFICATION

• INFRARED ABSORPTION

Sample: 200 mg of Ethylene Glycol and Vinyl Alcohol Graft Copolymer

Analysis: Dissolve the *Sample* in 5–10 mL of water. Spread 1 mL of this solution on a thallium bromide window.¹ Totally moisten the surface area of the window. Dry the window at 110° for approximately 30 min, and allow the window to cool to room temperature.

Acceptance criteria: The IR absorption spectrum of Ethylene Glycol and Vinyl Alcohol Graft Copolymer ex-

¹ Thallium bromide, also known as KRS-5, consists of 42% thallium(I) bromide and 58% thallium(I) iodide by molecular weight. Suitable disks of KRS-5 are available from www.photonic.saint-gobain.com, www.almazoptics.com, and www.internationalcrystal.net.

hibits maxima corresponding to the same wavelengths as those of a similar preparation of USP Ethylene Glycol and Vinyl Alcohol Graft Copolymer RS treated in the same manner.

IMPURITIES

Inorganic Impurities

• RESIDUE ON IGNITION (281)

Sample: 10.0 g

Acceptance criteria: NMT 3.0%

Organic Impurities

• PROCEDURE 1: ETHYLENE OXIDE AND DIOXANE

[**CAUTION**—Ethylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated fume hood, using great care. Protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between 4° and 8°.]

[**NOTE**—Before using polyethylene glycol 200 in this test, remove any volatile components from it by placing 500 mL of polyethylene glycol 200 in a 1000-mL round-bottom flask, and attaching the flask to a rotary evaporator maintained at a temperature of 60° and under a vacuum of 10–20 mm Hg for 6 h.]

Acetaldehyde solution: 10 µg/mL of acetaldehyde.

[**NOTE**—Prepare the *Acetaldehyde solution* immediately before use.]

Ethylene oxide stock solution: Introduce 300 µL (corresponding to 250 mg) of gaseous ethylene oxide to the polyethylene glycol 200. Determine the absorbed mass of ethylene oxide via the weight of the solution before and after the absorption. Dilute the solution with the polyethylene glycol 200 to 100 g. This stock solution contains 2.5 mg/g of ethylene oxide. [**NOTE**—Prepare this stock solution immediately before use, and store in a refrigerator after preparation.]

Ethylene oxide solution: 100 µg/g of ethylene oxide in polyethylene glycol 200 from *Ethylene oxide stock solution*. Transfer 5 g of 100 µg/g ethylene oxide in polyethylene glycol 200 to a 50-mL volumetric flask filled with 30 mL of water. Dilute with water to volume, and mix to obtain a solution containing 10 µg/mL of ethylene oxide. [**NOTE**—Prepare this solution immediately before use, and use the solution directly after preparation.]

Dioxane solution: 500 µg/mL of dioxane

Standard solution A: Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL pressure headspace vial. [**NOTE**—Other sizes, such as 22-mL, may be used, depending on the operating conditions; however, the same size must be used for *Standard solution A*, *Standard solution B*, and the *Sample solution*.] Add 0.1 mL of *Acetaldehyde solution* and 0.1 mL of *Dioxane solution*, seal the vial, and mix.

Standard solution B: Transfer 1.0 g of Ethylene Glycol and Vinyl Alcohol Graft Copolymer to a 10-mL pressure headspace vial. Add 0.1 mL of *Ethylene oxide solution*, 0.1 mL of *Dioxane solution*, and 1.0 mL of *N,N*-dimethylacetamide, seal the vial, and mix.

Sample solution: Transfer 1.0 g of Ethylene Glycol and Vinyl Alcohol Graft Copolymer to a 10-mL pressure headspace vial. Add 1.0 mL of *N,N*-dimethylacetamide and 0.2 mL of water, seal the vial, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[**NOTE**—Use a headspace apparatus that automatically transfers a measured amount of headspace.]

Mode: GC

Detector: Flame ionization

Detector temperature: 250°

Column: 0.25-mm × 30-m glass or quartz capillary column; 1.0-µm layer of phase G1

Column temperature: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (min)	Hold Time at Final Temperature (min)
50	—	50	5
50	5	180	—
180	30	230	5

Carrier gas: Helium
 Flow rate: 0.8 mL/min
 Injection size: 1 mL (the gaseous headspace)
 Injection type: Split ratio 20:1
 Injection port temperature: 250°
 Headspace sampler
 Equilibration time: 45 min
 Equilibration temperature
 Standard solution A: 70°
 Standard solution B: 90°
 Sample solution: 90°
 Transfer line temperature: 150°
 Pressurization time: 1 min
 Final headspace pressure: 0.7 bar
 Injection time: 12 s

System suitability

Sample: *Standard solution A*

[NOTE—The relative retention times for acetaldehyde and ethylene oxide are 0.94 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between acetaldehyde and ethylene oxide

Signal-to-noise: NLT 5 determined from the dioxane peak

Relative standard deviation: NMT 15%

Analysis

Samples: *Standard solution B* and *Sample solution*

Calculate the content of ethylene oxide, in ppm, in the portion of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken:

$$\text{Result} = A_E \times r_U / [(r_S \times W_U) - (r_U \times W_S)]$$

A_E = quantity of ethylene oxide added to *Standard solution B* (µg)

r_U = ethylene oxide peak response from the *Sample solution*

r_S = ethylene oxide peak response from *Standard solution B*

W_U = weight of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken to prepare the *Sample solution* (g)

W_S = weight of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken to prepare *Standard solution B* (g)

Calculate the content of dioxane, in ppm, in the portion of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken:

$$\text{Result} = A_D \times r_U / [(r_S \times W_U) - (r_U \times W_S)]$$

A_D = quantity of dioxane added to *Standard solution B* (µg)

r_U = dioxane peak response from the *Sample solution*

r_S = dioxane peak response from *Standard solution B*

W_U = weight of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken to prepare the *Sample solution* (g)

W_S = weight of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken to prepare *Standard solution B* (g)

Acceptance criteria: NMT 1 ppm of ethylene oxide; NMT 10 ppm of dioxane

• PROCEDURE 2: VINYL ACETATE

Solution A: Acetonitrile, methanol, and water (5:5:90)

Solution B: Acetonitrile, methanol, and water (45:5:50)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
40	85	15
42	0	100
48	0	100
51	100	0

System suitability solution: Transfer 50 mg of vinyl acetate and 50 mg of 1-vinylpyrrolidin-2-one to a 50-mL volumetric flask, add 10 mL of methanol, and sonicate or gently shake the flask to dissolve the materials. Dilute with *Solution A* to volume. Dilute 10 mL of this solution with *Solution A* to 100 mL. Dilute 5 mL of this solution with *Solution A* to 100 mL. The *System suitability solution* contains about 5 µg/mL each of vinyl acetate and 1-vinylpyrrolidin-2-one.

Standard solution: Transfer 50 mg of vinyl acetate to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix well. Dilute 5.0 mL of the solution with *Solution A* to 100 mL. Dilute 10.0 mL of this solution with *Solution A* to 100 mL. The *Standard solution* contains about 2.5 µg/mL of vinyl acetate. [NOTE—This solution should be analyzed within 1 h when stored at room temperature.]

Sample solution: Transfer 250 mg of Ethylene Glycol and Vinyl Alcohol Graft Copolymer to a 10-mL volumetric flask, and add 1–2 mL of methanol, using an ultrasonic bath if necessary. After cooling to ambient temperature, dilute with water to volume, and mix. Pass through a 0.2-mm membrane filter. [NOTE—This solution should be analyzed within 1 h when stored at room temperature.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.0-mm × 25-cm analytical column; 5-µm packing L1. A 4.0-mm × 3-cm pre-column; 5-µm packing L1 may be used if a matrix effect is observed.

[NOTE—The matrix effect may result in poor reproducibility of the retention times and of the peak shapes.]

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for vinyl acetate and 1-vinylpyrrolidin-2-one are 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 5.0 between vinyl acetate and 1-vinylpyrrolidin-2-one

Relative standard deviation: NMT 5.0% determined from the 1-vinylpyrrolidin-2-one peak

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: The response of the vinyl acetate peak from the *Sample solution* is NMT that of the vinyl acetate peak from the *Standard solution*, corresponding to NMT 100 ppm of vinyl acetate.

• PROCEDURE 3: ACETIC ACID/ACETATE

Mobile phase: 5 mM sulfuric acid

Standard solution: 0.3 mg/mL for each of acetic acid and citric acid in *Mobile phase*

Sample solution: 20 mg/mL of Ethylene Glycol and Vinyl Alcohol Copolymer

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column clean: After each injection, rinse the column with a mixture of equal volumes of *Mobile phase* and acetonitrile.

Column temperature: Ambient

Flow rate: 1 mL/min

Injection size: 20 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for acetic acid and citric acid are 1.0 and 1.3, respectively.]

Suitability requirements

Resolution: NLT 2.0 between acetic acid and citric acid

Relative standard deviation: NMT 5.0% determined from the acetic acid peak

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: The response of the acetic acid peak from the *Sample solution* is NMT that of the acetic acid peak from the *Standard solution*, corresponding to NMT 1.5% of acetic acid.

SPECIFIC TESTS

- **FATS AND FIXED OILS, Ester Value** <401>: 10–75
 - **LOSS ON DRYING** <731>: Dry 1.0 g of Ethylene Glycol and Vinyl Alcohol Graft Copolymer in a vacuum at 140° for 1 h; it loses NMT 5.0% of its weight.
 - **PH** <791>: 5.0–8.0, in a solution of 20% (w/w) in carbon dioxide-free water
 - **ROTATIONAL RHEOMETER METHODS** <912>: After determining the *Loss on Drying*, weigh a quantity of undried Ethylene Glycol and Vinyl Alcohol Graft Copolymer, equivalent to 100.0 g on the dried basis. Transfer the sample to a short form, 600-mL beaker (internal diameter about 80 mm and height 120 mm), and add water to make the mixture weigh 500 g. Ensure a homogeneous solution by gently stirring at room temperature for 48 h. Afterwards allow the container to stand for 24 h to let the entrapped air dissipate. [NOTE—Ensure that the concentration of this solution is 20% (w/w).] Determine the viscosity of this solution at 23 ± 0.1° using a suitable rotational viscometer with a spindle having a cylinder 4.7 cm in diameter and 0.2 cm high attached to a shaft 0.3 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 2.7 cm, and the immersion depth being 4.9 cm.² Operate the viscometer at 100 rpm. Follow the instrument manufacturer's directions to measure the apparent viscosity.
- Acceptance criteria:** 25–250 mPa · s

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at a temperature below 25°.
- **LABELING:** Label it to indicate the viscosity, giving the viscosity measurement parameters, concentration of the solution, and the type of equipment used. The labeling also indicates the name and quantity of any added glidant.
- **USP REFERENCE STANDARDS** <11>
USP Ethylene Glycol and Vinyl Alcohol Graft Copolymer RS

Ethylene Glycol Stearates

DEFINITION

Ethylene Glycol Stearates is a mixture of ethylene glycol monoesters and diesters of stearic and palmitic acids. It contains NLT 50.0% of monoesters produced from the condensation of ethylene glycol and stearic acid of vegetable or animal origin.

IDENTIFICATION

- **A.** It meets the requirements in *Specific Tests* for *Melting Range or Temperature, Class II* <741>.
- **B.** It meets the requirements in *Specific Tests* for *Fats and Fixed Oils, Fatty Acid Composition* <401>.

ASSAY

• **PROCEDURE**

Mobile phase: Tetrahydrofuran

Sample solution: 40 mg/mL of Ethylene Glycol Stearates in tetrahydrofuran

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.5-mm × 60-cm; containing 5-μm 100Å packing L21. [NOTE—Two or three 7.5-mm × 30-cm L21 columns may be used in place of the one 60-cm column, provided that *System suitability* requirements are met.]

Temperatures

Column: 40°. [NOTE—The column temperature may be lowered to ambient temperature, although working at 40° provides stable separation conditions and ensures better sample solubility.]

Detector: 40°

Flow rate: 1 mL/min

Injection volume: 40 μL

System suitability

Sample: *Sample solution*

[NOTE—The relative retention times for diesters, monoesters, and ethylene glycol are 0.76, 0.83, and 1.0, respectively.]

Suitability requirements

Relative standard deviation: NMT 2.0% for the monoesters peak

Analysis

Sample: *Sample solution*

Calculate the percentage of free fatty acids, *E*, in the portion of Ethylene Glycol Stearates taken:

$$E = I_A \times 270/561.1$$

I_A = acid value, determined in *Specific Tests* for *Fats and Fixed Oils, Acid Value (Free Fatty Acids)* <401>

Calculate the percentage of monoesters in the portion of *Sample* taken:

$$\text{Result} = [r_M / (r_M + r_D)](100 - D - E)$$

r_M = peak response for the monoesters

r_D = peak response for the diesters

D = percentage of free ethylene glycol in the portion of Ethylene Glycol Stearates taken, as determined in *Impurities for Limit of Free Ethylene Glycol*

Acceptance criteria: NLT 50.0% of monoesters

IMPURITIES

• **LIMIT OF FREE ETHYLENE GLYCOL**

Mobile phase, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

² A commercial instrument is available as an RV2 spindle from Brookfield.

Standard solution A: 0.5 mg/mL of ethylene glycol in tetrahydrofuran

Standard solution B: 1.0 mg/mL of ethylene glycol in tetrahydrofuran

Standard solution C: 2.0 mg/mL of ethylene glycol in tetrahydrofuran

Standard solution D: 4.0 mg/mL of ethylene glycol in tetrahydrofuran

Analysis

Samples: *Sample solution* and *Standard solutions*

Plot the ethylene glycol peak responses obtained versus the concentration of ethylene glycol in the *Standard solutions*. From the standard curve so obtained, determine the ethylene glycol concentration in the *Sample solution*.

Calculate the percentage of free ethylene glycol in the portion of sample taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of ethylene glycol, determined from the standard curve (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: NMT 5.0%

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE, Class II (741):** 54°–60°

• **FATS AND FIXED OILS, Acid Value (Free Fatty Acids) (401)**

Sample: 10.0 g

Acceptance criteria: NMT 3.0

• **FATS AND FIXED OILS, Iodine Value (401):** NMT 3.0

• **FATS AND FIXED OILS, Saponification Value (401)**

Sample: 2.0 g

Acceptance criteria: 170–195

• **FATS AND FIXED OILS, Fatty Acid Composition (401):** 40.0%–60.0% of stearic acid, and the sum of palmitic and stearic acids is NLT 90.0%.

• **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561)**

Sample: 1.0 g

Acceptance criteria: NMT 0.1%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.

• **LABELING:** Label it to indicate that it is intended for topical use only.

Ethylparaben

$C_9H_{10}O_3$

Benzoic acid, 4-hydroxy-, ethyl ester;
Ethyl *p*-hydroxybenzoate [120-47-8].

166.17

DEFINITION

Ethylparaben contains NLT 98.0% and NMT 102.0% of $C_9H_{10}O_3$.

IDENTIFICATION

• **A. INFRARED ABSORPTION (197M)**

• **B. MELTING RANGE OR TEMPERATURE (741):** 115°–118°

ASSAY

PROCEDURE

Mobile phase, Sample solution, Standard solution B, and Chromatographic system: Proceed as described in the procedure for *Related Substances*.

System suitability

Sample: *Standard solution B*

Suitability requirements

Relative standard deviation: NMT 0.85% for 6 injections

Analysis

Samples: *Sample solution* and *Standard solution B*

Calculate the percentage of Ethylparaben in the *Sample solution*:

$$\text{Result} = P \times (r_U \times C_S) / (r_S \times C_U)$$

P = labeled purity of USP Ethylparaben RS expressed as a percentage

r_U = peak area of ethylparaben from the *Sample solution*

C_S = concentration of ethylparaben in *Standard solution B*

r_S = peak area of ethylparaben from *Standard solution B*

C_U = concentration of Ethylparaben in the *Sample solution*

Acceptance criteria: 98.0%–102.0%

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION (281):** NMT 0.1%, determined on 1.0 g

Organic Impurities

PROCEDURE: RELATED SUBSTANCES

Mobile phase: Methanol and a 6.8-g/L solution of potassium dihydrogen phosphate (65:35 v/v)

Sample solution: Dissolve 50.0 mg of Ethylparaben in 2.5 mL of methanol, and dilute with *Mobile phase* to 50.0 mL. Dilute 10.0 mL of this solution with *Mobile phase* to 100.0 mL.

Standard solution A: 5.0 µg/mL each of *p*-hydroxybenzoic acid, USP Methylparaben RS, and USP Ethylparaben RS in *Mobile phase*

Standard solution B: Dissolve 50.0 mg of USP Ethylparaben RS in 2.5 mL of methanol, and dilute with *Mobile phase* to 50.0 mL. Dilute 10.0 mL of this solution with *Mobile phase* to 100.0 mL.

Standard solution C: Dilute 1.0 mL of the *Sample solution* with *Mobile phase* to 20.0 mL. Dilute 1.0 mL of this solution with *Mobile phase* to 10.0 mL.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: UV 272 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.3 mL/min

Injection size: 10 µL

Run time: About 4 times the retention time of ethylparaben

System suitability

Sample: *Standard solution A*

[NOTE—The retention time of ethylparaben is about 3.0 min; the relative retention times for *p*-hydroxybenzoic acid, ethylparaben, and methylparaben are about 0.5, 1.0, and 0.8, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the methylparaben and ethylparaben peaks

Analysis

Samples: *Sample solution* and *Standard solution C*

[NOTE—Disregard any limit that is 0.2 times the area of the principal peak in the chromatogram obtained with *Standard solution C* (0.1%).]

Acceptance criteria

***p*-Hydroxybenzoic acid:** The peak area in the *Sample solution*, multiplied by 1.4 to correct for the calculation of content, is NMT the area of the principal peak in *Standard solution C* (0.5%).

Unspecified impurities: The peak area of each impurity in the *Sample solution* is NMT the area of the principal peak in *Standard solution C* (0.5%).
Total impurities: The total peak area for all impurities in the *Sample solution* is NMT twice the area of the principal peak in *Standard solution C* (1.0%).

SPECIFIC TESTS

• COLOR OF SOLUTION

Sample solution: 100 mg/mL in alcohol
Comparison solution: Mix 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, and 0.4 mL of cupric sulfate CS with 0.3 N hydrochloric acid to make 10 mL. Dilute 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL. [NOTE—Prepare and use this solution immediately.]

Analysis

Samples: Alcohol, *Sample solution*, and *Comparison solution*

Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* (631)).

Acceptance criteria: The *Sample solution* is clear and not more intensely colored than alcohol or the *Comparison solution*.

• ACIDITY

Sample solution: To 2 mL of *Sample solution* prepared in the test for *Color of Solution*, add 3 mL of alcohol, 5 mL of carbon dioxide-free water, and 0.1 mL of bromocresol green TS.

Analysis: Titrate with 0.10 N sodium hydroxide.

Acceptance criteria: NMT 0.1 mL is required to produce a blue color.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
 USP Ethylparaben RS
 USP Methylparaben RS

Hard Fat

DEFINITION

Hard Fat is a mixture of glycerides of saturated fatty acids.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.05%
- **ALKALINE IMPURITIES**

Sample: 2.0 g

Analysis: Dissolve the *Sample* in a mixture of 1.5 mL of alcohol and 3.0 mL of ether. Add 0.05 mL of bromophenol blue TS, and titrate with 0.01 N hydrochloric acid to a yellow endpoint.

Acceptance criteria: NMT 0.15 mL of 0.01 N hydrochloric acid

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE, Class II** (741): The melting temperature does not differ by more than 2° from the nominal value given in *Labeling*.
- **FATS AND FIXED OILS, Acid Value** (401): NMT 1.0
- **FATS AND FIXED OILS, Hydroxyl Value** (401): NMT 70
- **FATS AND FIXED OILS, Iodine Value** (401): NMT 7.0
- **FATS AND FIXED OILS, Saponification Value** (401): 215–255
- **FATS AND FIXED OILS, Unsaponifiable Matter** (401): NMT 3.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers at a temperature that is 5° or more below the melting range stated in the labeling.

- **LABELING:** The labeling includes the nominal melting temperature, which is 27°–44°.

Fennel Oil

DEFINITION

Fennel Oil is the volatile oil distilled with steam from the dried, ripe fruit of *Foeniculum vulgare* Mill. (Fam. Apiaceae).

[NOTE—If solid material has separated, carefully warm the Fennel Oil until it is completely liquefied, and mix before using.]

IMPURITIES

- **HEAVY METALS, Method II** (231): NMT 40 µg/g

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 0.953–0.973
- **CONGEALING TEMPERATURE** (651): NLT 3°
- **OPTICAL ROTATION, Angular Rotation** (781A): +12° to +24°
- **REFRACTIVE INDEX** (831): 1.528–1.538 at 20°
- **SOLUBILITY IN 90% ALCOHOL:** 1 volume dissolves in 1 volume of 90% alcohol.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived. The label also states that if solid material has separated, carefully warm Oil until it is completely liquefied, and mix before using.

Ferric Oxide

DEFINITION

Ferric Oxide contains NLT 97.0% and NMT 100.5% of ferric oxide (Fe₂O₃), calculated on the ignited basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Iron** (191)
Sample solution: Dissolve 0.5 g in 50 mL of hydrochloric acid, and dilute with water to 200 mL.
Acceptance criteria: Meets the requirements of the test for *Ferric Salts*

ASSAY

• PROCEDURE

To calculate the percentage of ferric oxide on the ignited basis, ignite about 2 g at 800 ± 25° to constant weight as directed in *Loss on Ignition* (733). [NOTE—Ignited Ferric Oxide is hygroscopic.]

Sample: 1.5 g

Blank: 25 mL of hydrochloric acid

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Digest the *Sample* in 25 mL of hydrochloric acid on a water bath until dissolved. Add 10 mL of hydrogen peroxide TS, and evaporate on a water bath almost to dryness to volatilize all hydrogen peroxide. Dissolve the residue by warming with 5 mL of hydrochloric acid; add 25 mL of water; filter into a 250-mL volumetric flask, washing the filter with water; and add water to volume.

Transfer a 50-mL aliquot to a glass-stoppered flask, add 3 g of potassium iodide and 5 mL of hydrochloric acid, and insert the stopper into the flask. Allow the mixture to stand for 15 min, add 50 mL of water, and titrate

the liberated iodine with *Titrant*, using starch TS as the indicator. Perform a blank determination in the same manner.

Calculate the percentage of ferric oxide (Fe_2O_3) in the portion of the sample taken:

$$\text{Result} = \{(V_s - V_b) \times N \times F / W\} \times 100$$

V_s = *Titrant* volume consumed by the *Sample* (mL)
 V_b = *Titrant* volume consumed by the *Blank* (mL)
 N = actual normality of the *Titrant* (mEq/mL)
 F = equivalency factor, 79.85 mg/mEq
 W = *Sample* weight, calculated with a correction for loss on ignition (mg)

Acceptance criteria: 97.0%–100.5% on the ignited basis

IMPURITIES

• MERCURY, Method IIa (261)

Test preparation: Combine 0.67 g of Ferric Oxide and 35 mL of 0.5 N hydrochloric acid. Heat to boiling, and allow to cool.

Analysis: Proceed as directed for *Test preparation* in the chapter, beginning with "Add 2 drops of phenolphthalein".

Acceptance criteria: NMT 3 µg/g

• LIMIT OF ARSENIC

Lead acetate cotton: Immerse absorbent cotton pledgets in a mixture of lead acetate TS and 2 N acetic acid (10:1). Free the cotton pledgets from excess liquid by expression, and allow to air-dry.

Sodium borohydride solution: 30 mg/mL of sodium borohydride in 0.25 N sodium hydroxide. Store in a loosely covered container protected from direct sunlight.

Mercuric bromide paper: Immerse several filter paper disks with a 15-mm diameter in alcoholic mercuric bromide TS, remove the disks from the solution, and allow to dry, protected from light. Store in a glass-stoppered container protected from light.

Arsenic trioxide stock solution: Dissolve 132.0 mg of arsenic trioxide in 2.0 mL of 2 N sodium hydroxide, and dilute with water to 100 mL.

Standard stock solution: On the day of use, dilute 1.0 mL of *Arsenic trioxide stock solution* with water to 1000 mL.

Standard solution: Dilute 1.5 mL of the *Standard stock solution* with hydrochloric acid to 10 mL. This solution contains 0.15 µg/mL of arsenic.

Sample solution: Dissolve 0.5 g of Ferric Oxide in several mL of hydrochloric acid with the aid of heat, and dilute with hydrochloric acid to 10.0 mL.

Apparatus: Prepare a 300-mL, side-arm conical flask containing a magnetic stirring bar. Attach to the conical flask a ground-glass stopper. Pass through the ground-glass stopper a glass tube 20 cm long with an internal diameter of 5 mm. The lower end of this tube is inside the conical flask, and it has been drawn to a tip with an internal diameter of 1 mm. There is an orifice, 2.5 mm in diameter, 15 mm from the tip, and at least 3 mm below the lower surface of the stopper. The upper end of the tube has a flat ground surface at a right angle to the axis of the tube.

A second glass tube, 30 mm long with an internal diameter of 5 mm and with a similar flat ground surface, is placed in contact with the ground surface of the first tube and is held in position by a clamp and springs.

Into the lower tube insert 55 mg of loosely packed *Lead acetate cotton*. Between the flat surfaces of the tubes place a disk of *Mercuric bromide paper*.

Analysis: Before placing the tube assembly into the flask, transfer the *Sample solution* to the flask, and add 5.0 mL of potassium iodide TS and 20 mL of water. Assemble the apparatus immediately, and stir while

slowly adding, over a period of 20 min, 40 mL of *Sodium borohydride solution* through the side arm of the flask. Examine the stain produced on the *Mercuric bromide paper*. Perform the same *Analysis* using the *Standard solution*.

Acceptance criteria: NMT 3 µg/g; the stain produced on the *Mercuric bromide paper* from the *Sample solution* is not more intense than that from the *Standard solution*.

• LIMIT OF LEAD

Lead nitrate stock solution: 1.598 mg/mL of lead nitrate in 0.5 M nitric acid. Prepare and store this solution in glass containers free from soluble lead salts.

Standard stock solution: On the day of use, combine 5.0 mL of *Lead nitrate stock solution* and 10 mL of 1 N hydrochloric acid, and dilute with water to 100 mL.

Standard solution: Transfer 1.0 mL of the *Standard stock solution* to a 100-mL volumetric flask, add 10 mL of 1 N hydrochloric acid, and dilute with water to volume. This solution contains 0.5 µg/mL of lead.

Sample solution: Transfer 2.5 g of Ferric Oxide to a 100-mL, glass-stoppered conical flask. Add 35 mL of 0.1 N hydrochloric acid, and stir for 1 h. Filter, collecting the filtrate in a 50-mL volumetric flask, and dilute with 0.1 N hydrochloric acid to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a flow spoiler

Analytical wavelength: 217.0 nm (lead emission line)

Lamp: Lead hollow-cathode

Flame: Air–acetylene oxidizing

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: 0.001%; the absorbance of the *Sample solution* does not exceed that of the *Standard solution*.

SPECIFIC TESTS

• WATER-SOLUBLE SUBSTANCES

Sample: 2.0 g

Analysis: Digest the *Sample* in 100 mL of water on a boiling water bath for 2 h, filter, and wash the filter with water. Evaporate the filtrate and washings, and dry the residue at 105° for 1 h.

Acceptance criteria: 1.0%; NMT 20 mg of residue

• ACID-INSOLUBLE SUBSTANCES

Sample: 2.0 g

Analysis: Digest the *Sample* in 25 mL of hydrochloric acid by boiling for 20 min. Add 100 mL of hot water, and filter quantitatively through a tared filtering crucible, with the aid of hot wash water, until the filtrate tests negative for chloride. Dry the crucible and contents at 105° for 1 h.

Acceptance criteria: 0.3%; the residue weighs NMT 6 mg.

• ORGANIC COLORS AND LAKES

Sample: 3.0 g

Analysis: Place 1.0 g of the *Sample* in each of 3 beakers, and add 25 mL of each of the following reagents, one reagent to each beaker: 1-chloronaphthalene, alcohol, and chloroform. Heat the beakers containing alcohol and chloroform just to boiling. Heat the other beaker on a boiling water bath for 15 min, with occasional swirling. Pass the contents of the beakers through retentive, solvent-resistant filter paper. If any of the filtrates shows visible turbidity, centrifuge for 15 min. Record the spectra against respective solvent blanks in 1-cm cells from 350 to 750 nm.

Acceptance criteria: No peak above the noise level with a slope greater than +0.001 absorbance unit/nm is found.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Ferrosoferric Oxide

Fe₃O₄ (FeO · Fe₂O₃) 231.54
 Magnetite;
 Ferrous-ferric oxide;
 Iron (II, III) oxide [1317-61-9].

DEFINITION

Ferrosoferric Oxide contains NLT 97.0% and NMT 100.5% of Fe₂O₃, calculated on the ignited basis.

IDENTIFICATION

- **A.**
Sample solution: Dissolve 0.1 g in 5 mL of hydrochloric acid, and dilute with water to 50 mL.
Analysis 1: Transfer 5 mL of the *Sample solution* to a test tube, and add a few drops of potassium ferrocyanide TS.
Analysis 2: Transfer 5 mL of the *Sample solution* to a test tube, and add a few drops of potassium ferricyanide TS.
Acceptance criteria: For both *Analysis 1* and *Analysis 2*, a blue precipitate (Prussian blue) is formed, which does not dissolve in dilute hydrochloric acid subsequently added. The precipitate dissolves in oxalic acid and sodium or potassium hydroxide.
- **B.** Ferrosoferric Oxide presents as black powder, which is distinguished from ferric oxide exhibiting two basic colors (red and yellow). It is attracted to a magnet.

ASSAY• **PROCEDURE**

To enable the calculation of the percentage of Fe₂O₃ on the ignited basis, ignite about 2 g at 800 ± 25° to constant weight as directed in *Loss on Ignition* (733).
 [NOTE—Ignited Ferrosoferric Oxide is hygroscopic.]
Sample: 1.5 g
Blank: 25 mL of hydrochloric acid
Titrimetric system
 (See *Titrimetry* (541)).
Mode: Direct titration
Titrant: 0.1 N sodium thiosulfate VS
Endpoint detection: Visual
Analysis: Digest the *Sample* in 25 mL of hydrochloric acid on a water bath until dissolved. Add 10 mL of hydrogen peroxide TS, and evaporate on a water bath almost to dryness in order to volatilize all hydrogen peroxide. Dissolve the residue by warming with 5 mL of hydrochloric acid; add 25 mL of water; filter into a 250-mL volumetric flask, washing the filter with water; and add water to volume. Transfer a 50-mL aliquot to a glass-stoppered flask, add 3 g of potassium iodide and 5 mL of hydrochloric acid, and insert the stopper into the flask. Allow the mixture to stand for 15 min, add 50 mL of water, and titrate the liberated iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination in the same manner. Calculate the percentage of the labeled amount as ferric oxide (Fe₂O₃) in the portion of the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F] / W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)
 V_B = *Titrant* volume consumed by the *Blank* (mL)
 N = actual normality of the *Titrant* (mEq/mL)
 F = equivalency factor, 79.85 mg/mEq
 W = weight of the *Sample*, calculated with a correction for loss on ignition (mg)

Acceptance criteria: 97.0%–100.5% on the ignited basis

IMPURITIES• **LIMIT OF ARSENIC (As)**

[NOTE—Select all reagents to have as low contents of heavy metals as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse all glassware before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solvent: 10% hydrochloric acid in water

Standard stock solution: Prepare a solution containing 2 ppm of arsenic from an Arsenic ICP/AA standard solution in *Solvent*. [NOTE—A commercially available certified standard solution can be used.]

Sample stock solution: In a 100-mL volumetric flask, dissolve 5.0 g of Ferrosoferric Oxide in 50 mL of hydrochloric acid by heating without boiling for about 1 h until the sample is dissolved. Cool down to room temperature. Pass through a filter, if necessary. Dilute with water to volume. Transfer 20.0 mL of the solution to a 100-mL volumetric flask, add 40 mL of ascorbic acid solution (200 mg/mL of ascorbic acid in water) and 20 mL of potassium iodide solution (400 mg/mL of potassium iodide in water), and dilute with water to volume. [NOTE—Reduce arsenic to the lowest possible oxidation state.] The resulting solution contains 10 mg/mL (g/L) of Ferrosoferric Oxide.

Sample solution A: Transfer 20 mL of the *Sample stock solution* to a 100-mL volumetric flask. Dilute with *Solvent* to volume. The resulting solution contains 2 mg/mL (g/L) of Ferrosoferric Oxide.

Sample solution B: Transfer 20 mL of the *Sample stock solution* to a 100-mL volumetric flask. Add 25 mL of the *Standard stock solution*, and dilute with *Solvent* to volume.

Sample solution C: Transfer 20 mL of the *Sample stock solution* to a 100-mL volumetric flask. Add 50 mL of the *Standard stock solution*, and dilute with *Solvent* to volume.

Blank: *Solvent*

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Lamp: Arsenic hollow-cathode

Flame: Air-acetylene

Analytical wavelength: 193.696 nm

Analysis

Samples: *Sample solution A*, *Sample solution B*, and *Sample solution C*

[NOTE—To minimize matrix interference, it is recommended that the method of standard additions be used.]

Determine the absorbances of the *Samples* against the *Blank*, and plot the corrected absorbances versus their added content of arsenic (0, 0.5, and 1.0 ppm). Draw the straight line best fitting the three points, and extrapolate the line until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of arsenic, C_A , in ppm (μg/g) in the 2 mg/mL of Ferrosoferric Oxide in *Solvent*.

Calculate the content of arsenic, in μg/g, in the portion of Ferrosoferric Oxide taken:

$$\text{Result} = C_A \times D$$

D = dilution factor, 25

Acceptance criteria: NMT 2 ppm

• **LIMIT OF CADMIUM (Cd) AND CHROMIUM (Cr)**

[NOTE—Select all reagents to have as low contents of heavy metals as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse all glassware before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solvent: 10% hydrochloric acid in water

Standard stock solution: Prepare a solution containing 2 ppm each of cadmium and chromium from an ICP standard solution containing cadmium and chromium in *Solvent*. [NOTE—A commercially available certified standard solution can be used.]

Sample stock solution: In a 100-mL volumetric flask, dissolve 5.0 g of Ferrosoferric Oxide in 50 mL of hydrochloric acid by heating without boiling for about 1 h until the sample is dissolved. Cool down to room temperature. Pass through a filter, if necessary. Dilute with water to volume. Transfer 20.0 mL of the solution to a 100-mL volumetric flask, and add water to volume. The resulting solution contains 10 mg/mL of Ferrosoferric Oxide.

Sample solution A: Transfer 20 mL of the *Sample stock solution* to a 100-mL volumetric flask. Dilute with *Solvent* to volume. The resulting solution contains 2 mg/mL of Ferrosoferric Oxide.

Sample solution B: Transfer 20 mL of the *Sample stock solution* to a 100-mL volumetric flask. Add 25 mL of the *Standard stock solution*, and dilute with *Solvent* to volume.

Sample solution C: Transfer 20 mL of the *Sample stock solution* to a 100-mL volumetric flask. Add 50 mL of the *Standard stock solution*, and dilute with *Solvent* to volume.

Blank: *Solvent*

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851) and *Plasma Spectrochemistry* (730).)

Mode: Inductively coupled plasma–atomic emission spectrometer (ICP–AES)

Analytical wavelength

Cadmium: 228.802 nm

Chromium: 267.716 nm

Analysis

Samples: *Sample solution A*, *Sample solution B*, and *Sample solution C*

[NOTE—The operating conditions may be developed and optimized based on the manufacturer's recommendation.][NOTE—To minimize matrix interference, it is recommended that the method of standard additions be used.]

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check. Aspirate the *Samples*, at least in duplicate, and calculate the average absorbances for each against the *Blank*. Plot the average absorbances of the *Samples* versus their added content (0, 0.5, and 1.0 ppm) of cadmium (or chromium). Draw the straight line best fitting the three points, and extrapolate the line until it intercepts the concentration axis. The distance between this point and the intersection of the axes represents the concentration of cadmium (or chromium), C_C , in ppm ($\mu\text{g/g}$) in the 2 mg/mL of Ferrosoferric Oxide in *Solvent*.

Calculate the content of cadmium (or chromium), in $\mu\text{g/g}$, in the portion of Ferrosoferric Oxide taken:

$$\text{Result} = C_C \times D$$

D = dilution factor, 25

Acceptance criteria

Cadmium: NMT 1 ppm

Chromium: NMT 100 ppm

• LIMIT OF LEAD (Pb)

[NOTE—Select all reagents to have as low contents of heavy metals as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse all glassware before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solvent: 4% hydrochloric acid and 8% nitric acid in water

Standard solution: Prepare a solution containing 25 ppb of lead in *Solvent*. [NOTE—A commercially available certified standard solution can be used.]

Sample stock solution: Dissolve 1.0 g of Ferrosoferric Oxide in 4 mL of hydrochloric acid and 8 mL of nitric acid in a 100-mL volumetric flask by heating without boiling until the sample is dissolved. Cool down to room temperature. Pass through a filter, if necessary. Dilute with water to volume. The resulting solution in the flask contains 10 mg/mL of Ferrosoferric Oxide.

Sample solution A: Transfer 10 mL of the *Sample stock solution* to a 100-mL volumetric flask, and dilute with *Solvent* to volume. The solution contains 1 mg/mL of Ferrosoferric Oxide.

Sample solution B: Transfer 10 mL of the *Sample stock solution* to a 100-mL volumetric flask. Add 4 mL of the *Standard solution*, and dilute with *Solvent* to volume.

Sample solution C: Transfer 10 mL of the *Sample stock solution* to a 100-mL volumetric flask. Add 12 mL of the *Standard solution*, and dilute with *Solvent* to volume.

Sample solution D: Transfer 10 mL of the *Sample stock solution* to a 100-mL volumetric flask. Add 20 mL of the *Standard solution*, and dilute with *Solvent* to volume.

Blank: *Solvent*

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with graphite heating device

Analytical wavelength: 283.3 nm

Lamp: Lead hollow-cathode

Analysis

Samples: *Sample solution A*, *Sample solution B*, *Sample solution C*, and *Sample solution D*

[NOTE—To minimize matrix interference, it is recommended that the method of standard additions be used.]

Determine the absorbances of the *Samples* against the *Blank*, and plot the corrected absorbances versus their added content (0, 1, 3, and 5 ppb) of lead. Draw the straight line best fitting the four points, and extrapolate the line until it intercepts the concentration axis. The distance between this point and the intersection of the axes represents the concentration of lead, C_L , in ppm ($\mu\text{g/g}$) in the 1 mg/mL of Ferrosoferric Oxide.

Calculate the content of lead, in $\mu\text{g/g}$, in the portion of Ferrosoferric Oxide taken:

$$\text{Result} = C_L \times D$$

D = dilution factor, 10

Acceptance criteria: NMT 10 ppm

• LIMIT OF MERCURY (Hg) AND NICKEL (Ni)

[NOTE—Select all reagents to have as low contents of heavy metals as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse all glassware before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Solvent: 10% hydrochloric acid in water

Standard solution: Prepare a solution containing 2 ppm of mercury (or nickel) from a Mercury (or Nickel) ICP/AA standard solution in *Solvent*. [NOTE—A commercially available certified standard solution can be used.]

Sample stock solution: In a 100-mL volumetric flask, dissolve 5.0 g of Ferrosoferric Oxide in 50 mL of hydrochloric acid by heating without boiling for about 1 h until the sample is dissolved. Cool down to room temperature. Pass through a filter, if necessary. Dilute with water to volume. Transfer 20.0 mL of the solution to a 100-mL volumetric flask, and add water to volume. The resulting solution contains 10 mg/mL of Ferrosoferric Oxide.

Sample solution A: Transfer 20 mL of the *Sample stock solution* to a 100-mL volumetric flask. Dilute with

Solvent to volume. The resulting solution contains 2 mg/mL of Ferrosoferric Oxide.

Sample solution B: Transfer 20 mL of the *Sample solution* to a 100-mL volumetric flask. Add 25 mL of the *Standard solution*, and dilute with *Solvent* to volume.

Sample solution C: Transfer 20 mL of the *Sample solution* to a 100-mL volumetric flask. Add 50 mL of the *Standard solution*, and dilute with *Solvent* to volume.

Blank: *Solvent*

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer

Detection

Mercury: Flameless

Nickel: Air-acetylene flame

Lamp: Mercury hollow-cathode or nickel hollow-cathode

Analytical wavelength

Mercury: 253.7 nm

Nickel: 231.604 nm

Analysis

Samples: *Sample solution A*, *Sample solution B*, and *Sample solution C*

[NOTE—To minimize matrix interference, it is recommended that the method of standard additions be used.]

Determine the absorbances of the *Samples* against the *Blank*, and plot the corrected absorbances versus their content (0, 0.5, and 1.0 ppm) of mercury (or nickel). Draw the straight line best fitting the three points, and extrapolate the line until it intercepts the concentration axis. The distance between this point and the intersection of the axes represents the concentration of mercury (or nickel), C_s , in ppm ($\mu\text{g/g}$) in the 2 mg/mL of Ferrosoferric Oxide in *Solvent*.

Calculate the content of mercury (or nickel), in $\mu\text{g/g}$, in the portion of Ferrosoferric Oxide taken:

$$\text{Result} = C_s \times D$$

D = dilution factor, 25

Acceptance criteria

Mercury: NMT 1 ppm

Nickel: NMT 200 ppm

SPECIFIC TESTS

• WATER-SOLUBLE SUBSTANCES

Sample: 2.0 g

Analysis: Digest the *Sample* in 100 mL of water on a boiling water bath for 2 h, filter, and wash the filter with water. Evaporate the filtrate and washings, and dry the residue at 105° for 1 h.

Acceptance criteria: The weight of the dried residue is NMT 20 mg, corresponding to NMT 1.0%.

• ACID-INSOLUBLE SUBSTANCES

Sample: 2.0 g

Analysis: Digest the *Sample* in 25 mL of hydrochloric acid by boiling for 20 min. Add 100 mL of hot water, and filter quantitatively through a tared filtering¹ crucible, with the aid of hot wash water, until the filtrate tests negative for chloride. Dry the crucible and contents at 105° for 1 h.

Acceptance criteria: The weight of the residue is NMT 6 mg, corresponding to NMT 0.3%.

• ORGANIC COLORS AND LAKES

Analysis: Place 1.0 g in each of 3 beakers, and add 25 mL of each of the following reagents, respectively: 1-chloronaphthalene, alcohol, and chloroform. Heat the beakers containing alcohol and chloroform just to boiling. Heat the other beaker on a boiling water bath for 15 min, with occasional swirling. Pass the contents

of the beakers through retentive, solvent-resistant filter paper.² If any of the filtrates show visible turbidity, centrifuge for 15 min. Record the spectra against respective solvent blanks in 1-cm cells from 350 to 750 nm.

Acceptance criteria: Absorbance in the range of 350–750 nm is NMT 0.01 AU.

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g.

• **PH** (791): 6–9 in a 10% suspension

• **LOSS ON DRYING** (731)

Analysis: Dry a sample at 105° for 1 h.

Acceptance criteria: NMT 1.0% of its weight

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

Fructose—see *Fructose General Monographs*

Fumaric Acid

116.07

2-Butenedioic acid, *E*;
Fumaric acid [110-17-8].

DEFINITION

Fumaric Acid contains NLT 99.5% and NMT 100.5% of $\text{C}_4\text{H}_4\text{O}_4$, calculated on the anhydrous basis.

IDENTIFICATION

• **INFRARED ABSORPTION** (197A)

ASSAY

• PROCEDURE

Sample solution: Dissolve 1 g of Fumaric Acid in 50 mL of methanol, and warm gently on a steam bath to effect solution. Cool, and add phenolphthalein TS.

Analysis: Titrate the *Sample solution* with 0.5 N sodium hydroxide VS to the first appearance of a pink color that persists for not less than 30 s. Perform a blank titration (see *Titrimetry* (541)). Each mL of 0.5 N sodium hydroxide is equivalent to 29.02 mg of $\text{C}_4\text{H}_4\text{O}_4$.

Acceptance criteria: 99.5%–100.5% on the anhydrous basis

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **HEAVY METALS, Method II** (231): NMT 10 ppm

Organic Impurities

• PROCEDURE: LIMIT OF MALEIC ACID

Mobile phase: 0.005 N sulfuric acid

Standard solution: 1 $\mu\text{g/mL}$ of USP Maleic Acid RS in *Mobile phase*

Sample solution: 1 mg/mL of Fumaric Acid in *Mobile phase*

System suitability solution: 10 $\mu\text{g/mL}$ of USP Fumaric Acid RS and 5 $\mu\text{g/mL}$ of USP Maleic Acid RS in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

² A PTFE filter (diameter 25 mm, 0.2- μm pore size), or equivalent.

¹ A glass-filter disc (P4; pore size diameter 9 to 15 μm) can be used, or equivalent.

Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 22-cm; packing L17
Flow rate: 0.3 mL/min
Injection size: 5 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for maleic acid and fumaric acid are about 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.5 of the maleic acid and fumaric acid peaks

Relative standard deviation: NMT 2.0% of the maleic acid peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of maleic acid in the total weight of Fumaric Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of maleic acid from the *Sample solution*

r_S = peak response of maleic acid from the *Standard solution*

C_S = concentration of USP Maleic Acid RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.1%

SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
 USP Fumaric Acid RS
 USP Maleic Acid RS

Galactose

$C_6H_{12}O_6$ 180.16
 α -D-Galactopyranose [3646-73-9].

DEFINITION

Galactose is one of the products of the metabolism of lactose, a naturally occurring sugar in dairy products, by the digestive enzyme lactase.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**
Solution A: Methanol and water (60:40)
Standard solution A: 500 µg/mL of USP Galactose RS in *Solution A*
Standard solution B: 500 µg/mL each of USP Galactose RS, USP Dextrose RS, and USP Lactose Monohydrate RS in *Solution A*
Sample solution: Dissolve 10 mg of Galactose in 20 mL of *Solution A*.
Chromatographic system
 (See *Chromatography (621)*, *Thin-Layer Chromatography*.)

Application volume: 2 µL

Developing solvent system: Propanol and water (85:15)

Spray reagent: 0.5 g of thymol in a mixture of alcohol and sulfuric acid (95:5)

System suitability

Sample: *Standard solution B*

Suitability requirements

Resolution: There must be three clearly resolved spots in the chromatogram for *Standard solution B*.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the plate in an unsaturated tank. After the solvent front has moved over 15 cm, remove the plate from the tank. Dry the plate with warm air, then spray the plate with *Spray reagent*. Heat for 10 min in an oven at 130°.

Acceptance criteria: The R_f of the principal spot of the *Sample solution* corresponds to that of *Standard solution A*.

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%
- **LIMIT OF LEAD**

Diluent: Dilute 12 mL of acetic acid with water to 100 mL. Mix equal parts of this solution and water to prepare the *Diluent*.

Lead standard solution: 16 µg/mL of lead nitrate

Standard solutions: To three identical flasks add 0.5, 1.0, and 1.5 mL of *Lead standard solution*, respectively, and then add to each flask 20.0 g of Galactose. Dilute with *Diluent* to 100 mL. To each flask add 2.0 mL of ammonium pyrrolidinedithiocarbamate solution (10 mg/mL) and 10.0 mL of methyl isobutyl ketone, then shake for 30 s. Protect from light. Allow the layers to separate, and use the methyl isobutyl ketone (upper) layer.

Sample solution: Dissolve 20.0 g of Galactose in 100 mL of *Diluent*. Add 2.0 mL of ammonium pyrrolidinedithiocarbamate solution (10 mg/mL) and 10.0 mL of methyl isobutyl ketone, and shake for 30 s. Protect from light. Allow the layers to separate, and use the methyl isobutyl ketone (upper) layer.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering (851)*.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 283.3 nm

Lamp: Lead hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Standard solutions* and *Sample solution*
 Concomitantly determine, at least in triplicate, the absorbances of the *Samples*. Record the average steady readings for each of the *Standard solutions* and the *Sample solution*. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the amount of lead added. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of lead in the *Sample solution*.

Acceptance criteria: NMT 0.5 µg/g

• **BARIUM**

Standard solution: Add 6 mL of water to 5 mL of the *Sample solution* prepared for the *Acidity* test.

Sample solution: Add 5 mL of water and 1 mL of dilute sulfuric acid to 5 mL of the *Sample solution* prepared for the *Acidity* test. Allow to stand for 1 h.

Acceptance criteria: Any opalescence in the *Sample solution* is not more intense than that in the *Standard solution*.

SPECIFIC TESTS**• APPEARANCE OF SOLUTION**

Sample solution: Dissolve, with heating at 50°, 10.0 g of Galactose in 50 mL of carbon dioxide-free water.

Control solution: Prepare immediately before use by mixing 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, and 2.4 mL of cupric sulfate CS with dilute hydrochloric acid (10 mg/mL) to make 10 mL, and diluting 1.5 mL of this solution with the dilute hydrochloric acid to 100 mL.

Analysis: Compare by viewing the *Sample solution* and the *Control solution* downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* <631>).

Acceptance criteria: The *Sample solution* is not more intensely colored than the *Control solution*.

• MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>: The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g. It meets the requirements of the test for absence of *Salmonella* species, *Escherichia coli*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*.

• OPTICAL ROTATION, Specific Rotation <781S>

Sample solution: Transfer 10.0 g to a 100-mL volumetric flask, and dissolve in 80 mL of water. Add 0.2 mL of ammonia TS, allow to stand for 30 min, then dilute with water to volume.

Analysis: Perform at 20°.

Acceptance criteria: +78.0° to +81.5°

• ACIDITY

Sample solution: Dissolve 10.0 g of Galactose, with heating at 50°, in 40 mL of carbon dioxide-free water. Dilute with carbon dioxide-free water to 50 mL. [NOTE—Use this solution for the *Barium* test.]

Analysis: To 30 mL of the *Sample solution* add 0.3 mL of phenolphthalein TS, and titrate with 0.01 N sodium hydroxide to a pink color.

Acceptance criteria: NMT 1.5 mL of 0.01 N sodium hydroxide is required.

• WATER DETERMINATION, Method I <921>: NMT 1.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in a tight container. No storage requirements specified.

• USP REFERENCE STANDARDS <11>

USP Dextrose RS
USP Galactose RS
USP Lactose Monohydrate RS

Galageenan**DEFINITION**

Galageenan is the hydrocolloid obtained by extraction with water or aqueous alkali from the red seaweed class Rhodophyceae species *Eucheuma gelatinae*. Galageenan consists chiefly of potassium, sodium, calcium, magnesium, and ammonium sulfate esters of galactose and 3,6-anhydrogalactose copolymers. These hexoses are alternately linked as α -1,3 and β -1,4 in the polymer. The ester sulfate content ranges from 8%–18%. In addition, it contains inorganic salts that originate from the seaweed and from the process of recovery from the extract.

Galageenan is recovered by alcohol precipitation or by freezing and pressing.

IDENTIFICATION**• A. FILM FORMATION**

Solution A: A solution (1 in 50), prepared by heating a uniform dispersion in a hot water bath to 80°

Acceptance criteria: *Solution A* becomes more viscous upon cooling and may form a gel.

• B.

Analysis: Dilute a portion of *Solution A* (retained from *Identification test A*) with 4 parts water, and add 2–3 drops of methylene blue TS.

Acceptance criteria: A blue, stringy precipitate is formed.

• C. INFRARED ABSORPTION <197F>

Sample solution: Disperse 2 g of Galageenan in 400 mL of a solution containing 5 g of edetate disodium in 1000 mL of 60% isopropyl alcohol, and stir for 2 h. Filter with the aid of vacuum, and wash the residue with a total of 200 mL of 65% isopropyl alcohol. Finish washing with a total of 100 mL of 80% isopropyl alcohol. Dry the residue for 30 min in a 60° oven, and overnight in a 70° vacuum oven. Break lumps by grinding with a mortar and pestle. Dissolve 15 mg of the alcohol-treated material in 5 mL of water. Heat for 10 min in a water bath. Pipet 2 mL onto a suitable non-sticking surface to produce a 5- μ m-thick film (when dry).

Spectral range: 2000–600 cm^{-1}

Analysis: Subtract the baseline (drawn by connecting the minima in the range of 1500 and 800 cm^{-1}) from the raw spectrum. Record the absorbances for the bands at 1220–1260, 928–933, 840–850, and 800–805 cm^{-1} relative to the absorbance at 1050 cm^{-1} .

Acceptance criteria: The absorbance values so obtained are within the ranges specified in *Table 1*.

Table 1

Wave Number (cm^{-1})	Molecular Assignment	Absorbance Relative to 1050 cm^{-1} Galageenan
1220–1260	Ester sulfate	0.3–0.6
928–933	3,6-Anhydrogalactose	0.3–0.6
840–850	Galactose-4-sulfate	0.1–0.3
800–805	3,6-Anhydrogalactose-2-sulfate	0.0–0.1

ASSAY**• CONTENT OF SULFATE**

Sample: 300 mg

Analysis: Weigh the *Sample* on an ashless filter paper. Fold the paper so as to enclose the *Sample*, and place it in a 500-mL Kjeldahl flask. Add 45 mL of nitric acid, and bring to a boil on a hot plate in a fume hood. Add nitric acid as necessary to keep the sample from evaporating to dryness. Continue boiling until digestion is complete and the volume of nitric acid remaining is about 10 mL. Cool the mixture, and reduce the excess nitric acid by adding formaldehyde TS until the evolution of nitrogen oxide vapors has ceased. Heat this mixture on a hot plate to reduce the volume to about 10 mL. Transfer the mixture to a 150-mL beaker with the aid of several portions of water until the total volume is approximately 100 mL. Add 0.5 mL of hydrochloric acid, and bring to a boil on a hot plate. Add carefully 10 mL of 0.25 M barium chloride, and allow to boil for 1 min. Cover with a watch glass, and allow to stand overnight. Filter the solution through a tared, fine-porosity filtering crucible previously ignited in a muffle furnace at 550° for 30 min and cooled in a desiccator for 30 min. Wash the barium sulfate precipitate so obtained on the crucible several times with boiling water. Place the crucible in an oven, and heat at 100° for 30 min. Transfer the crucible to a muffle furnace, and ignite for 30 min at 550°. Remove the crucible, and cool in a desiccator for 30 min.

Weigh and calculate the percentage of sulfate groups:

$$\text{Result} = (W_B/W_S) \times (M_{r1}/M_{r2}) \times 100$$

- W_B = weight of barium sulfate obtained (mg)
 W_S = weight of Galageenan taken (mg)
 M_{r1} = molecular weight of the sulfate group, 96.02
 M_{r2} = molecular weight of barium sulfate, 233.43
Acceptance criteria: 8%–18% sulfate

IMPURITIES

- **LEAD** (251): NMT 5 ppm
- **HEAVY METALS**, *Method II* (231): NMT 20 ppm
- **ACID-INSOLUBLE MATTER**

Sample: 2 g

Analysis: Transfer the *Sample* to a 250-mL beaker containing 150 mL of water and 1.5 mL of sulfuric acid. Cover with a watch glass, and heat on a steam bath for 6 h, rubbing down the wall of the beaker frequently with a rubber-tipped stirring rod, and replacing any water lost by evaporation. Transfer 500 mg of a suitable filter aid to the beaker, and pass through a tared filtering crucible equipped with a 2.4-cm glass fiber filter. Wash the residue several times with hot water, dry at 105° for 3 h, cool in a desiccator, and weigh. The difference between the total weight and the sum of the weights of the filter aid, crucible, and glass fiber filter is the weight of the acid-insoluble matter.

Acceptance criteria: NMT 2.0% of the weight of Galageenan taken

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 200 cfu/g, the total combined molds and yeasts count does not exceed 20 cfu/g, and it meets the requirements of the tests for absence of *Escherichia coli* and *Salmonella* species.

- **ROTATIONAL RHEOMETER METHODS** (912)

Sample solution: Transfer 7.5 g of Galageenan to a tared, tall-form, 600-mL beaker. Add 450 mL of water, and disperse with agitation for 15 min. Add water to bring the weight to 500 g, and heat in a water bath, with continuous agitation, until a temperature of 80° is reached. Add water to adjust for loss by evaporation, cool to between 76° and 77°, and place in a constant-temperature bath maintained at 75°.

Analysis: Use a suitable rotational viscometer equipped with a spindle having a cylinder 1.88 cm in diameter and 6.51 cm in height, and an immersion depth of 8.10 cm (No. 1 spindle). Allow the spindle to rotate in the solution at 30 rpm for six revolutions, then observe the scale reading. Convert the scale reading to centipoises by multiplying by the constant for the spindle and speed used.

Acceptance criteria: NLT 15 centipoises (at 75°)

- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 35.0%
- **LOSS ON DRYING** (731): Dry a sample at a pressure not exceeding 10 mm of mercury at 70° for 18 h, cool in a desiccator, and weigh: it loses NMT 12.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, preferably in a cool place.

Gelatin

DEFINITION

Gelatin is a product obtained by the partial hydrolysis of collagen derived from the skin, white connective tissue, and bones of animals. Gelatin derived from an acid-treated precursor is known as Type A, and Gelatin derived from an alkali-treated precursor is known as Type B. Gelatin, where being used in the manufacture of capsules, or for the coating of tablets, may be colored with a certi-

fied color, may contain NMT 0.15% of sulfur dioxide, and may contain a suitable concentration of sodium lauryl sulfate and suitable antimicrobial agents.

IDENTIFICATION• **A. PROCEDURE**

Sample: 1 g

Analysis: Dissolve the *Sample* in 100 mL of hot water. To this solution add 20 mL of a mixture of 0.2 M potassium dichromate and 3 N hydrochloric acid (4:1).

Acceptance criteria: A yellow precipitate is formed.

• **B. PROCEDURE**

Sample solution: 0.2 mg/mL

Analysis: Heat until hot, and add tannic acid TS.

Acceptance criteria: Turbidity is produced.

OTHER COMPONENTS• **CONTENT OF SULFUR DIOXIDE**

Sample solution: Dissolve 20.0 g in 150 mL of hot water in a flask having a round bottom and a long neck, add 5 mL of phosphoric acid and 1 g of sodium bicarbonate, and at once connect the flask with a condenser. [NOTE—Excessive foaming can be alleviated by the addition of a few drops of a suitable antifoaming agent.]

Analysis: Distill 50 mL, receiving the distillate under the surface of 50 mL of 0.1 N iodine. Acidify the distillate with a few drops of hydrochloric acid, add 2 mL of barium chloride TS, and heat on a steam bath until the liquid is nearly colorless.

Acceptance criteria: The precipitate of barium sulfate, if any, when filtered, washed, and ignited, weighs NMT 3 mg, corresponding to NMT 40 ppm of sulfur dioxide, correction being made for any sulfate that may be present in 50 mL of the 0.1 N iodine.

Gelatin used in the manufacture of capsules or for the coating of tablets yields NMT 109.3 mg of barium sulfate, corresponding to NMT 0.15% of sulfur dioxide.

IMPURITIES**Inorganic Impurities**• **RESIDUE ON IGNITION** (281)

Sample: 5.0 g

Analysis: Incinerate without the use of sulfuric acid, but with the addition of 1.5–2.0 g of paraffin to avoid loss due to swelling, then finish ashing in a muffle furnace at 550° for 15–20 h.

Acceptance criteria: The weight of the residue does not exceed 2.0%.

• **ARSENIC**, *Method I* (211)

Solution A: 5 mg/mL of pepsin in 0.1 N hydrochloric acid

Standard solution: Transfer 3.0 mL of *Standard Arsenic Solution* to an arsine generator flask, and dilute with *Solution A* to 52 mL. Add 3 mL of hydrochloric acid and 4 mL of isopropyl alcohol.

Sample solution: Mix 3.75 g with 40 mL of *Solution A* in an arsine generator flask. Heat cautiously to a temperature between 65° and 70°, and, while maintaining this temperature for 30 min, sonicate the solution for 2 min at each 10-min interval of heating time. Cool, wash down the sides of the generator with *Solution A*, and dilute with *Solution A* to 52 mL. Add 3 mL of hydrochloric acid and 4 mL of isopropyl alcohol.

Analysis: Proceed as directed in the chapter, except omit the addition of 20 mL of 7 N sulfuric acid and 1 mL of isopropyl alcohol to the *Standard solution* and *Sample solution*.

Acceptance criteria: The resulting solution from the *Sample solution* meets the requirements of the test (NMT 0.8 ppm).

• **HEAVY METALS** (231)

Sample: Residue obtained in the test for *Residue on Ignition*

Analysis: To the *Sample* add 2 mL of hydrochloric acid and 0.5 mL of nitric acid, and evaporate on a steam bath to dryness. To the residue add 1 mL of 1 N hydrochloric acid and 15 mL of water, and warm for a few min. Filter and wash with water to make the filtrate measure 100 mL. Dilute 8 mL of the solution with water to 25 mL.

Acceptance criteria: NMT 50 ppm

Organic Impurities

- **PROCEDURE: ODOR AND WATER-INSOLUBLE SUBSTANCES:** A hot solution (1 in 40) is free from any disagreeable odor, and when viewed in a layer 2-cm thick, is only slightly opalescent.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total bacterial count does not exceed 1000 cfu/g, and the tests for *Salmonella* species and *Escherichia coli* are negative.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers in a dry place.

Gellan Gum

[71010-52-1].

DEFINITION

Gellan Gum is a high-molecular-weight polysaccharide gum produced by a pure-culture fermentation of a carbohydrate with *Pseudomonas elodea*, purified by recovery with isopropyl alcohol, and then dried and milled. It is a heteropolysaccharide comprising a tetrasaccharide repeating unit of one rhamnose, one glucuronic acid, and two glucose units. The glucuronic acid is neutralized to mixed potassium, sodium, calcium, and magnesium salts. It may contain acyl (glyceryl and acetyl) groups as the O-glycosidically linked esters. It yields NLT 3.3% and NMT 6.8% of carbon dioxide, calculated on the dried basis.

IDENTIFICATION

- **A.**
Sample solution: Hydrate 1 g of Gellan Gum in 99 mL of deionized water. Stir the mixture for 2 h, using a motorized stirrer and a propeller-type stirring blade.
Analysis: Draw a small amount of the solution obtained into a wide-bore pipet, and transfer it to a 10% calcium chloride solution. [NOTE—Reserve the remaining portion of this solution for *Identification* test B.]
Acceptance criteria: A tough, wormlike gel will form instantly.
- **B.**
Sample solution: The remaining *Sample solution* from *Identification* test A
Analysis: Add 0.5 g of sodium chloride, heat the solution to 80°, stirring constantly, and hold at 80° for 1 min. Stop heating and stirring the solution, and allow it to cool to room temperature.
Acceptance criteria: A firm gel will form.

ASSAY

- **ALGINATES ASSAY** (311)
Sample: 1.2 g of undried Gellan Gum
Analysis: Proceed as directed for the *Procedure* in the chapter.
Acceptance criteria: 3.3%–6.8% of carbon dioxide on the dried basis

IMPURITIES

- **LEAD** (251)
Test preparation: Prepare as directed, using a 2.0-g portion of Gellan Gum. Use 4 mL of *Diluted Standard Lead Solution* (4 µg of Pb) for the test.
Acceptance criteria: NMT 2.0 µg/g
- **ARSENIC, Method II** (211): NMT 3.0 µg/g
- **LIMIT OF ISOPROPYL ALCOHOL**
Internal standard solution: 1 mg/mL of tertiary butyl alcohol
Standard stock solution: 1 mg/mL of isopropyl alcohol
Standard solution: Pipet 4 mL of the *Standard stock solution* and 4 mL of the *Internal standard solution* into a 100-mL volumetric flask, dilute with water to volume, and mix.
Sample solution: Disperse 1 mL of a suitable antifoam emulsion in 200 mL of water contained in a 1000-mL, round-bottom distilling flask having a 24/40 standard taper ground joint. Add 5 g of Gellan Gum, and shake for 1 h on a wrist-action mechanical shaker. Connect the flask to a fractionating column, and distill about 100 mL, adjusting the heat so that foam does not enter the column. Add by pipet 4 mL of the *Internal standard solution*, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC
Detector: Flame ionization
Column: 3.2-mm × 1.8-m stainless steel; packed with 80- to 100-mesh surface silanized packing S3, or equivalent
Temperatures
Column: 165°
Detector: 200°
Injection port: 200°
Carrier gas: Helium
Injection volume: 4–5 µL

Analysis

Samples: *Standard solution* and *Sample solution*
 [NOTE—The retention time of tertiary butyl alcohol is 1.5 relative to that of isopropyl alcohol.]
 Calculate the amount of isopropyl alcohol in the portion of Gellan Gum taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of isopropyl alcohol to the internal standard from the *Sample solution*
 R_S = peak response ratio of isopropyl alcohol to the internal standard from the *Standard solution*
 C_S = concentration of isopropyl alcohol in the *Standard solution* (mg/mL)
 C_U = concentration of the *Sample solution* (mg/mL)
Acceptance criteria: NMT 0.075%

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count is NMT 10³ cfu/g, and the total combined molds and yeasts count is NMT 10² cfu/g.
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561): 4.0%–14.0% on the dried basis
- **LOSS ON DRYING** (731)
Analysis: Dry at 105° for 2.5 h.
Acceptance criteria: NMT 15.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.

Pharmaceutical Glaze

DEFINITION

Pharmaceutical Glaze is a specially denatured alcoholic solution of Shellac containing between 20.0% and 57.0% of anhydrous shellac and is made with either dehydrated alcohol or alcohol containing 5% water by volume. The solvent is a specially denatured alcohol approved for glaze manufacturing by the Internal Revenue Service. It contains NLT 90.0% and NMT 110.0% of the labeled amount of shellac. It may contain waxes and titanium dioxide as an opaquing agent.

IDENTIFICATION

• A.

Sample: Remaining sample solution retained from the Assay

Analysis: Pour the remainder of the solution in the volumetric flask, retained from the Assay, onto a clean glass plate, and place the plate in a nearly vertical position. After drainage is complete, allow the resulting film to dry in a well-ventilated place at 20° for 1 h, then place the plate in an oven at a temperature of 43° for 16–24 h. Cool, and scrape the film from the plate with a sharp blade, discarding the thick edges. To 50 mg of the *Sample* add a few drops of a mixture of 1 g of ammonium molybdate and 3 mL of sulfuric acid. Retain the remaining film for the tests for *Heavy Metals* and *Rosin*.

Acceptance criteria: A green color is produced, and it becomes lilac on standing for 5 min.

ASSAY

• PROCEDURE

Sample solution A: When testing Glaze that does not contain titanium dioxide, transfer a quantity of Glaze containing 17 g of shellac to a 100-mL volumetric flask, and add alcohol to volume. Pipet 3 mL into a tared dish containing 10 g of washed sand and a small glass rod. Retain the remaining solution in the volumetric flask for *Identification* test A. The tare weight includes the combined weights of the dish, the washed sand, and the glass rod.

Stir until a uniform mixture is obtained, allow the glass rod to remain in the dish, dry at 105° for 1 h in an explosion-proof oven, cool, and weigh.

Sample solution B: When testing Glaze that contains titanium dioxide, transfer a quantity containing 10 g of solids to a beaker, and add 10 mL of alcohol. Filter off the pigment with the aid of a vacuum. Wash the filter with alcohol; transfer the combined filtrate and washing, with the aid of alcohol, to a 200-mL volumetric flask; add alcohol to volume; and mix. Pipet 6 mL into a tared dish containing 10 g of washed sand and a small glass rod. Proceed as directed in *Sample solution A*, beginning with "The tare weight...".

Analysis: The weight of shellac in the quantity of Glaze taken is obtained by subtracting the tare weight from the final weight of the dried dish and contents.

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

• WAX

Sample: Weigh, by difference, a quantity of Glaze containing 10 g of shellac into a 200-mL tall-form beaker.

Analysis: To the *Sample* add with stirring 150 mL of hot water containing 2.5 g of sodium carbonate, immerse the beaker in a boiling water bath, and stir until the solid is dissolved. Cover the beaker with a watch glass, and maintain the heat for 3 h more without agitation. Remove the beaker to a cold water bath. When the wax has floated to the surface, pass the solution through medium-speed quantitative ashless filter paper, transferring the wax to the paper, and wash the filter with

water. Pour 5–10 mL of alcohol onto the filter to facilitate drying. Wrap the paper loosely in a larger piece of filter paper, bind with a piece of fine wire, and dry with the aid of gentle heat. Extract with chloroform in a suitable continuous extraction apparatus for 2 h, using a weighed flask to receive the extracted wax and solvent. Evaporate the solvent, and dry the wax at 105° to constant weight.

Acceptance criteria: It meets the requirements shown in *Table 1*.

Table 1

Type of Shellac	Wax
Orange shellac	NMT 5.5%
Dewaxed orange shellac	NMT 0.2%
Regular bleached shellac	NMT 5.5%
Refined bleached shellac	NMT 0.2%

IMPURITIES

• HEAVY METALS, *Method II* (231)

Test preparation: The film prepared in *Identification* test A

Acceptance criteria: NMT 10 ppm

• ROSIN

Sample: 2 g of the film prepared in *Identification* test A

Analysis: Dissolve the *Sample* by shaking with 10 mL of dehydrated alcohol. Add slowly, with shaking, 50 mL of solvent hexane, wash with two successive 50-mL portions of water, filter the washed alcohol–solvent hexane solution, and evaporate to dryness. To the residue add 2 mL of a mixture of liquefied phenol, dehydrated alcohol, and solvent hexane (1:0.5:2). Stir, and transfer a portion of the solution to the cavity of a color-reaction plate. Fill an adjacent cavity with a mixture of bromine and solvent hexane (1:4), and cover both cavities with an inverted watch glass.

Acceptance criteria: No purple or deep indigo-blue color is produced in or above the liquid containing the residue.

SPECIFIC TESTS

• ACID VALUE

Sample: Weigh, by difference, a quantity of Glaze containing 2 g of shellac.

Analysis: Dissolve the *Sample* in 50 mL of alcohol that has been neutralized to phenolphthalein with 0.1 N sodium hydroxide, add additional phenolphthalein TS if necessary, and titrate with 0.1 N sodium hydroxide VS to a pink endpoint. [NOTE—For Glaze containing orange shellac, titrate slowly, stirring vigorously, until a glass rod dipped into the titrated solution produces a color change when touched to a drop of thymol blue TS on a spot plate.]

Express the acid value in terms of the number of mg of potassium hydroxide required per g of dried shellac.

Acceptance criteria: It meets the requirements shown in *Table 2*.

Table 2

Type of Shellac	Acid Value (on Dried Basis)
Orange shellac	68–76
Dewaxed orange shellac	71–79
Regular bleached shellac	73–89
Refined bleached shellac	75–91

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, lined metal or plastic containers, protected from excessive heat, preferably at a temperature below 25°.

- **LABELING:** Label it to indicate whether the shellac type is bleached or orange and whether it is dewaxed or wax-containing. Label it also to indicate the shellac concentration, the composition of the solvent, and the quantity of titanium dioxide, if present. Where titanium dioxide or waxes are present, the label must state that the Glaze requires mixing before use.

Gluconolactone—see *Gluconolactone* *General Monographs*

Liquid Glucose

[8027-56-3].

DEFINITION

Liquid Glucose is a product obtained by the incomplete hydrolysis of starch. It consists chiefly of dextrose, dextrans, maltose, and water.

IDENTIFICATION

- **A.** It meets the requirements in the *Assay for Reducing Sugars (Dextrose Equivalent)*.

ASSAY

• REDUCING SUGARS (DEXTROSE EQUIVALENT)

Methylene blue solution: 10 mg/mL

Standard solution: 6 mg/mL of USP Dextrose RS

Sample solution: Transfer a quantity of Liquid Glucose, equivalent to about 3.0 g of reducing sugars (dextrose equivalent), to a 500-mL volumetric flask, and dilute with water to volume.

Analysis

Samples: *Standard solution* and *Sample solution*

Transfer 25.0-mL portions of alkaline cupric tartrate TS to each of two boiling flasks. Bring the contents of one flask to boiling within about 2 min while titrating with *Standard solution* to within 0.5 mL of the anticipated endpoint. Boil gently for 2 min. Continue to boil gently, add 2 drops of *Methylene blue solution*, and complete the titration within 1 min by adding the *Standard solution* dropwise or in small increments until the blue color disappears, determined by viewing against a white background in daylight or under equivalent illumination. If more than 0.5 mL of the titrant was required after the addition of the indicator, repeat the titration, adding the necessary volume of titrant before adding the indicator. Bring the contents of the second flask to boiling, and similarly titrate with the *Sample solution*.

Calculate the dextrose equivalent, on the anhydrous basis, taken:

$$\text{Result} = (C_S/C_U) \times (V_S/V_U) \times [1/(1 - 0.01 \times A)] \times 100$$

C_S = concentration of USP Dextrose RS in the *Standard solution* (mg/mL)

C_U = concentration of dextrose equivalent in the *Sample solution* (mg/mL)

V_S = *Titrant volume* consumed by the *Standard solution* (mL)

V_U = *Titrant volume* consumed by the *Sample solution* (mL)

A = percentage of water in the Liquid Glucose taken

Acceptance criteria: 90%–110% of the labeled value on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%

- **HEAVY METALS** (231)

Test preparation: Mix 2.0 g of Liquid Glucose with water to make 25 mL.

Acceptance criteria: NMT 10 µg/g

- **SULFITE**

Sample solution: 5 g in 50 mL of water

Analysis: To the *Sample solution* add 0.2 mL of 0.1 N iodine, then add 0.5 mL of starch TS.

Acceptance criteria: A blue color is produced.

- **STARCH**

Sample solution: 5 g in 50 mL of water

Analysis: Boil the *Sample solution* for 1 min, cool, and add 0.2 mL of 0.1 N iodine.

Acceptance criteria: No blue color is produced.

SPECIFIC TESTS

- **ACIDITY**

Sample solution: 5.0 g in 15 mL of water

Analysis: To the *Sample solution* add 5 drops of phenolphthalein TS, and titrate with 0.10 N sodium hydroxide.

Acceptance criteria: NMT 0.60 mL of 0.10 N sodium hydroxide is required to produce a pink color.

- **WATER DETERMINATION, Method 1a** (921)

Sample: 100 mg

Acceptance criteria: NMT 21.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tightly closed containers. No storage requirements specified.

- **LABELING:** Label it to indicate the natural source of starch. Label it to indicate its nominal dextrose equivalent.

- **USP REFERENCE STANDARDS** (11)

USP Dextrose RS

L-Glutamic Acid, Hydrochloride

$C_5H_9NO_4 \cdot HCl$

183.59

L-2-Aminoglutaric acid, hydrochloride;

2-Aminopentanedioic acid, hydrochloride [138-15-8].

DEFINITION

L-Glutamic Acid, Hydrochloride, contains NLT 98.5% and NMT 101.5% of $C_5H_9NO_4 \cdot HCl$, calculated on the dried basis.

IDENTIFICATION

- **INFRARED ABSORPTION** (197K)

ASSAY

- **PROCEDURE**

Sample: 100 mg of L-Glutamic Acid, Hydrochloride, previously dried

Analysis: Dissolve the *Sample* in 0.5 mL of water, add 15.0 mL of 0.1 N perchloric acid VS, and heat on a water bath for 30 min. After cooling, add 45 mL of glacial acetic acid, and titrate the excess perchloric acid with 0.1 N sodium acetate, determining the endpoint potentiometrically. Perform a blank determination (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 18.36 mg of $C_5H_9NO_4 \cdot HCl$.

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.25%
- **HEAVY METALS**, Method I (231): NMT 5 ppm

SPECIFIC TESTS

- **OPTICAL ROTATION**, Specific Rotation (781S): +25.2° to +25.8°, determined at 20°
Sample solution: 100 mg/mL in 2 N hydrochloric acid
- **LOSS ON DRYING** (731): Dry a sample at 80° for 4 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Store in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP L-Glutamic Acid, Hydrochloride RS

Glutaral Disinfectant Solution

DEFINITION

Glutaral Disinfectant Solution contains NLT 100.0% and NMT 110.0%, by weight, of the labeled amount of glutaraldehyde (C₅H₈O₂).

IDENTIFICATION

- **A. MELTING RANGE OR TEMPERATURE** (741)
2,4-Dinitrophenylhydrazine reagent: To 0.8 g of 2,4-dinitrophenylhydrazine add 4 mL of sulfuric acid, then add 6 mL of water, dropwise, with swirling. When dissolution is essentially complete, add 20 mL of alcohol, and filter. Use the filtrate.
Sample: 5 mL
Analysis: To 20 mL of 2,4-Dinitrophenylhydrazine reagent add the Sample, mix by swirling, and allow to stand for 5 min. Collect the precipitate on a filter, and rinse thoroughly with alcohol. Dissolve the precipitate in 20 mL of hot ethylene dichloride, filter, and cool the filtrate in an ice bath until crystallization occurs. Collect the precipitate on a filter. Redissolve the precipitate by refluxing with 30 mL of acetone, filter, and cool the filtrate in an ice bath until crystallization occurs. Collect the precipitate on a filter.
Acceptance criteria: The 2,4-dinitrophenylhydrazone so obtained melts between 185° and 195°, within a 3° range.

ASSAY

PROCEDURE

Buffer: Dissolve 2.59 g of monobasic potassium phosphate and 6.77 g of anhydrous dibasic sodium phosphate in 500 mL of water in a 1000-mL volumetric flask. Dilute to volume.
Hydroxylamine hydrochloride solution: 70 µg/mL of hydroxylamine hydrochloride in Buffer
Standard solution: 50 µg/mL of glutaraldehyde in water from Glutaral Concentrate
Standard blank solution: Add 10.0 mL of Standard solution and 10.0 mL of Buffer to a 50-mL volumetric flask, and dilute with water to volume.
Sample solution: 50 µg/mL of glutaraldehyde in water from Disinfectant Solution
Sample blank solution: Add 10.0 mL of Sample solution and 10.0 mL of Buffer to a 50-mL volumetric flask, and dilute with water to volume.
Reagent blank solution: Add 10.0 mL of Buffer and 10.0 mL of Hydroxylamine hydrochloride solution to a 50-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

Mode: UV
Analytical wavelength: 238 nm
Blank: Reagent blank solution

Analysis

Samples: Standard solution, Standard blank solution, Sample solution, and Sample blank solution
Transfer 10.0 mL each of the Standard solution and the Sample solution to separate 50-mL volumetric flasks. To each flask add 10.0 mL of Hydroxylamine hydrochloride solution, dilute with water to volume, mix, and allow each flask to stand for 25 min.
Concomitantly determine the absorbances of the Standard solution, Sample solution, Standard blank solution, and Sample blank solution.
Calculate the percentage of the labeled amount of glutaraldehyde (C₅H₈O₂) in the portion of Disinfectant Solution taken:

$$\text{Result} = [(A_U - A_{Ub}) / (A_S - A_{Sb})] \times (C_S / C_U) \times 100$$

A_U = absorbance of the Sample solution
 A_{Ub} = absorbance of the Sample blank solution
 A_S = absorbance of the Standard solution
 A_{Sb} = absorbance of the Standard blank solution
 C_S = concentration of glutaraldehyde in the Standard solution (µg/mL)
 C_U = concentration of the Sample solution (µg/mL)
Acceptance criteria: 100.0%–110.0%

SPECIFIC TESTS

- **PH** (791): 2.7–3.7

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

Glycerin—see Glycerin General Monographs

Glyceryl Behenate

DEFINITION

Glyceryl Behenate is a mixture of glycerides of fatty acids, mainly behenic acid.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**

Standard solution: 60 mg/mL of USP Glyceryl Behenate RS in chloroform
Sample solution: 60 mg/mL of Glyceryl Behenate in chloroform
Chromatographic plates: Use suitable thin-layer chromatographic plates (see Chromatography (621)) coated with a 0.25-mm layer of chromatographic silica gel. Predevelop the plates by placing in a chromatographic chamber saturated with ether. Remove the plates from the chamber, allow the ether to evaporate, and immerse the plates in a 2.5% solution of boric acid in alcohol. After about 1 min, withdraw the plates, allow them to dry at ambient temperature, and activate them at 110° for 30 min. Keep the plates in a desiccator.
Chromatographic system
(See Chromatography (621), Thin-Layer Chromatography.)
Mode: TLC
Application volume: 10 µL
Spray reagent: 0.02% solution of dichlorofluorescein in alcohol
Developing solvent system: Chloroform and acetone (96:4)

Analysis

Samples: *Standard solution* and *Sample solution*
Develop in *Developing solvent system* until the solvent front has moved about 12 cm. Remove the plate from the chamber, and allow the solvent to evaporate. Spray the chromatogram with *Spray reagent*. Examine the spots under short-wavelength UV light.

Acceptance criteria: The R_f values of the spots from the *Sample solution* correspond to those from the *Standard solution*.

• **B.**

Standard solution: Dissolve 22 mg of USP Glyceryl Behenate RS in 1 mL of toluene in a screw-capped vial having a polytetrafluoroethylene-lined septum. Add 0.4 mL of 0.2 N methanolic (*m*-trifluoromethylphenyl) trimethylammonium hydroxide. Attach the cap, and mix. Allow the vial to stand at room temperature for NLT 30 min.

Sample solution: Dissolve 22 mg of Glyceryl Behenate in 1 mL of toluene in a screw-capped vial having a polytetrafluoroethylene-lined septum. Add 0.4 mL of 0.2 N methanolic (*m*-trifluoromethylphenyl) trimethylammonium hydroxide. Attach the cap, and mix. Allow the vial to stand at room temperature for NLT 30 min.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 4-mm × 1.8-m, packed with 10% liquid phase G7 on support S1A

Column temperature: 225°

Analysis

Samples: *Standard solution* and *Sample solution*
Introduce a suitable volume into the gas chromatograph, and record the resulting chromatogram.

Acceptance criteria: The retention time of the main peak of the *Sample solution* corresponds to that of the main peak of the *Standard solution*. The ratio of the response of the main peak to the sum of all the responses is NLT 0.83.

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS**, *Method II* <231>: NMT 10 ppm
- **CONTENT OF 1-MONOGLYCERIDES**

Periodic acid solution: Dissolve 5.4 g of periodic acid in 100 mL of water, and add 1900 mL of glacial acetic acid. Store in a light-resistant, glass-stoppered bottle or in a clear glass-stoppered bottle protected from light.

Chloroform: Use chloroform that meets the following test. To each of three 500-mL flasks add 50.0 mL of *Periodic acid solution*. Add 50 mL of chloroform and 10 mL of water to two of the flasks, and add 50 mL of water to the third flask. To each flask add 20 mL of potassium iodide TS, mix gently, and proceed as directed in the *Analysis* below, beginning with "allow to stand for NLT 1 min". The difference between the volumes of 0.1 N sodium thiosulfate required in the titrations with and without the chloroform is NMT 0.5 mL.

Sample: Melt a quantity of Glyceryl Behenate at a temperature not higher than 80°.

Analysis: Transfer 1 g of the *Sample* to a 100-mL beaker, and dissolve in 25 mL of *Chloroform*. Transfer the solution, with the aid of an additional 25 mL of *Chloroform*, to a separator, wash the beaker with 25 mL of water, and add the washing to the separator. Tightly place the stopper in the separator, shake vigorously for 30–60 s, and allow the layers to separate. Add 1–2 mL of glacial acetic acid to break any emulsion formed. Collect the aqueous layer in a glass-stoppered 500-mL conical flask, and extract the nonaqueous layer again, using two 25-mL portions of water. [NOTE—Retain the combined aqueous extracts for the test for *Limit of Free Glycerin*.]

Transfer the nonaqueous layer to a glass-stoppered 500-mL conical flask, and add 50.0 mL of *Periodic acid solution* to this flask and to a blank flask containing 50 mL of *Chloroform* and 10 mL of water, swirling the flasks during the addition. Allow to stand for 30–90 min. To each flask add 20 mL of potassium iodide TS, and allow to stand for 1–5 min before titrating. Add 100 mL of water, and titrate with 0.1 N sodium thiosulfate VS, using a magnetic stirrer to keep the solution mixed, to the disappearance of the brown iodine color. Then add 2 mL of starch TS, and continue the titration to the disappearance of the blue color. [NOTE—If the Glyceryl Behenate titration is less than 0.8 of the blank titration, discard, and repeat using a smaller weight of Glyceryl Behenate.]

Calculate the percentage of 1-monoglycerides as glyceryl monobehenate:

$$\text{Result} = [(B - S) \times F \times N \times 100]/W$$

B = volume of 0.1 N sodium thiosulfate consumed by the blank (mL)

S = volume of 0.1 N sodium thiosulfate consumed by the Glyceryl Behenate (mL)

F = equivalency factor of glyceryl monobehenate, 207.3 mg/mEq

N = normality of the sodium thiosulfate

W = weight of Glyceryl Behenate taken (g)

Acceptance criteria: 12.0%–18.0%

• **LIMIT OF FREE GLYCERIN**

Periodic acid solution and Chloroform: Prepare as directed in the test for *Content of 1-Monoglycerides*.

Analysis: To the combined aqueous extracts obtained as directed in the test for *Content of 1-Monoglycerides* add 50.0 mL of *Periodic acid solution*. Prepare a blank by adding 50.0 mL of *Periodic acid solution* to a glass-stoppered conical flask containing 75 mL of water. Allow to stand for NLT 30 min but NMT 90 min. To each flask add 20 mL of potassium iodide TS, and allow to stand for NLT 1 min but NMT 5 min before titrating. Add 100 mL of water, and titrate with 0.1 N sodium thiosulfate VS, using a magnetic stirrer to keep the solution mixed, to the disappearance of the brown iodine color. Then add 2 mL of starch TS, and continue the titration to the disappearance of the blue color. Calculate the percentage of free glycerin:

$$\text{Result} = [(B - S) \times F \times N \times 100]/W$$

B = volume of 0.1 N sodium thiosulfate consumed by the blank (mL)

S = volume of 0.1 N sodium thiosulfate consumed by the Glyceryl Behenate (mL)

F = equivalency factor of glycerin, 23.0 mg/mEq

N = normality of the sodium thiosulfate

W = weight of Glyceryl Behenate taken (g)

Acceptance criteria: NMT 1.0%

SPECIFIC TESTS• **FATS AND FIXED OILS**, *Acid Value*, *Method I* <401>

Sample: 10 g

Analysis: Suspend the *Sample* in 50 mL of a mixture of alcohol and ether (1:1), which has been neutralized to phenolphthalein with 0.1 N sodium hydroxide, contained in a flask. Connect the flask with a suitable condenser, and warm, with frequent shaking, for 10 min. Continue as directed under *Fats and Fixed Oils* <401>, *Acid Value*, beginning with "Add 1 mL of phenolphthalein TS".

Acceptance criteria: NMT 4

• **FATS AND FIXED OILS**, *Saponification Value* <401>: 145–165• **FATS AND FIXED OILS**, *Iodine Value*, *Method II* <401>: NMT 3

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers at a temperature not higher than 35°.
- **USP REFERENCE STANDARDS** (11)
USP Glyceryl Behenate RS

Glyceryl Distearate

625.01

[1323-83-7].

DEFINITION

Glyceryl Distearate is a mixture of diglycerides, mainly glyceryl distearate, together with variable quantities of monoglycerides and triglycerides. It contains NLT 8.0% and NMT 22.0% of monoglycerides, NLT 40.0% and NMT 60.0% of diglycerides, and NLT 25.0% and NMT 35.0% of triglycerides. It is obtained by partial glycerolysis of vegetable oil that consists mainly of triglycerides of palmitic or stearic acid or by esterification of glycerol with stearic acid. The fatty acids may be of vegetable or animal origin.

IDENTIFICATION

- **A.** It meets the requirements in *Specific Tests for Melting Range or Temperature, Class II* (741).
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)
Standard solution: 50 mg/mL of USP Glyceryl Distearate RS in methylene chloride
Sample solution: 50 mg/mL in methylene chloride
Chromatographic system
Developing solvent system: Ether and hexane (70:30)
Spray reagent: 0.1 mg/mL of rhodamine B in alcohol
Analysis: Proceed as directed in the chapter. Spray with the *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.
Acceptance criteria: The principal spot of the *Sample solution* corresponds in color, size, and R_f value to that of the *Standard solution*.

Calculate the percentage of monoglycerides, diglycerides, and triglycerides in the portion of Glyceryl Distearate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = individual peak response for the monoglycerides, diglycerides, and triglycerides, as appropriate

r_T = sum of the responses for all of the glyceride peaks

Acceptance criteria**Monoglycerides:** 8.0%–22.0%**Diglycerides:** 40.0%–60.0%**Triglycerides:** 25.0%–35.0%**IMPURITIES**• **LIMIT OF NICKEL**

[**CAUTION**—When using closed high-pressure digestion vessels and microwave laboratory equipment, be familiar with the safety and operating instructions given by the manufacturer.]

Magnesium nitrate solution: 5 mg/mL of magnesium nitrate

Standard stock solution: Transfer 5.0 mL of nickel standard solution TS to a 10-mL volumetric flask. Add 0.5 mL of nitric acid and 1.0 mL of 30% hydrogen peroxide, and dilute with water to volume.

Standard solutions: Into four identical 25-mL volumetric flasks, each containing 6 mL of nitric acid, transfer 20, 50, 100, and 150 μL, respectively, of the *Standard stock solution*, and dilute with water to volume. These solutions contain 4, 10, 20, and 30 ng/mL of nickel, respectively.

Sample solution: Transfer 0.1 g of Glyceryl Distearate into a suitable high-pressure resistant digestion vessel (fluoropolymer or quartz), and add 6.0 mL of nitric acid and 2.0 mL of 30% hydrogen peroxide. Place the closed vessel in a laboratory microwave oven, and digest using an appropriate program (for example, 250 W for 10 min; 600 W for 5 min; 400 W for 5 min; and 250 W for 7 min). Allow the digestion vessel to cool before opening. Quantitatively transfer the contents to a 25-mL volumetric flask, and dilute with water to volume.

Blank: Add 6.0 mL of nitric acid and 2.0 mL of 30% hydrogen peroxide to a high-pressure-resistant digestion vessel, and proceed as directed for the *Sample solution*.

Zero solution: Transfer 6.0 mL of nitric acid into a 25-mL volumetric flask. Dilute with water to volume.

Instrumental conditions(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry equipped with a pyrolytically coated tube with a platform

Analytical wavelength: 232 nm**Lamp:** Nickel hollow-cathode

Graphite furnace parameters: Maintain the drying temperature of the furnace at 100° for 10 s after a 10-s ramp, the ashing temperature at 1400° for 10 s after a 20-s ramp, and the atomization temperature at 2500° for 5 s. Use the *Zero solution* to set the instrument to zero.

Analysis

Samples: Into seven separate 25-mL flasks, each containing 5.0 mL of *Magnesium nitrate solution*, transfer respectively 10.0 mL of each of the following: the *Sample solution*, the *Blank*, the four *Standard solutions*, and the *Zero solution*.

Concomitantly determine the absorbances of the *Samples* at least three times each. Record the average of

the steady readings for each of the solutions. [NOTE—If necessary, dilute the *Sample solution* with the *Zero solution* to obtain a reading within the calibrated absorbance range.]

Acceptance criteria: NMT 1 µg/g

• **LIMIT OF FREE GLYCERIN**

Mobile phase, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Standard solutions: 0.2, 0.4, 1.0, and 2.0 mg/mL of glycerin in tetrahydrofuran

Analysis

Samples: *Standard solutions* and *Sample solution*
Plot the glycerin peak responses versus the concentration of glycerin in the *Standard solutions*. From the standard curve so obtained, determine the glycerin concentration in the *Sample solution*. Calculate the percentage of free glycerin in the portion of Glyceryl Distearate taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of glycerin in the *Sample solution* from the standard curve (mg/mL)

C_U = concentration of Glyceryl Distearate in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 1.0%

USP Glyceryl Distearate RS

Glyceryl Monolinoleate

354.5

[26545-74-4].

DEFINITION

Glyceryl Monolinoleate is a mixture of monoglycerides, mainly glyceryl monooleate and glyceryl monolinoleate, together with variable quantities of diglycerides and triglycerides. It is obtained by partial glycerolysis of vegetable oil that consists mainly of triglycerides of linoleic acid. It contains NLT 32.0% and NMT 52.0% of monoglycerides, NLT 40.0% and NMT 55.0% of diglycerides, and NLT 5.0% and NMT 20.0% of triglycerides. A suitable antioxidant may be added.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

USP Glyceryl Monolinoleate RS

Glyceryl Monooleate

Oleic acid, 2,3-dihydroxypropyl ester, (±);
(*RS*)-1-Glyceryl oleate
[25496-72-4]. 356.54

DEFINITION

Glyceryl Monooleate is a mixture of monoglycerides, mainly glyceryl monooleate, together with variable quantities of diglycerides and triglycerides. It is obtained by partial

glycerolysis of vegetable oil that consists mainly of triglycerides of oleic acid, or by esterification of glycerol with oleic acid of vegetable or animal origin. It is defined by the nominal content of monoglycerides. The assay requirements differ as set forth in the accompanying table. A suitable antioxidant may be added.

Nominal Content of Monoglycerides (%)			
	40	60	90
Monoglycerides	32.0–52.0	55.0–65.0	90.0–101.0
Diglycerides	30.0–50.0	15.0–35.0	<10.0
Triglycerides	5.0–20.0	2.0–10.0	<2.0

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>**

Standard solution: 50 mg/mL of USP Glyceryl Monooleate 40% RS or USP Glyceryl Monooleate 90% RS in methylene chloride

Sample solution: 50 mg/mL of Glyceryl Monooleate in methylene chloride

Application volume: 10 µL

Developing solvent system: Ether and hexane (7:3)

Spray reagent: 0.1 mg/mL of rhodamine B in alcohol

Analysis: Proceed as directed in the chapter. Spray with the *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.

Acceptance criteria: The principal spot of the *Sample solution* corresponds in color, size, and *R_f* value to that of the *Standard solution*.

- **B.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Iodine Value <401>*.

Organic Impurities**• PROCEDURE: LIMIT OF FREE GLYCERIN**

Propionating reagent: Pyridine and propionic anhydride (1:2)

Internal standard solution: 0.2 mg/mL of tributyrin in chloroform

Standard solution: Transfer 15 mg of glycerin and 50 mg of tributyrin to a glass-stoppered, 25-mL conical flask. Add 3 mL of *Propionating reagent*, and heat at 75° for 30 min. Volatilize the reagents with the aid of a stream of nitrogen at room temperature, and add 12 mL of chloroform. Dilute 1 mL of this mixture with chloroform to 20 mL.

Sample solution: Transfer 50 mg of Glycerol Monostearate to a glass-stoppered, 25-mL conical flask. Add 5 mL of *Internal standard solution* by pipet, and mix to dissolve. Immerse the flask in a water bath, maintained at a temperature between 45° and 50°, and volatilize the chloroform with the aid of a stream of nitrogen. Add 3 mL of *Propionating reagent*, and heat at 75° for 30 min. Volatilize the reagents with the aid of a stream of nitrogen at room temperature, and add 5 mL of chloroform.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization (under typical conditions)

Column: 4-mm × 2.4-m borosilicate glass, packed with 2% liquid phase G16, on 80- to 100-mesh support S1A

Temperature

Injector: 300°

Detector: 310°

Column: The column is maintained isothermally at a temperature between 190° and 200°.

Carrier gas: Helium

Flow rate: 70 mL/min

System suitability

Sample: *Standard solution* (6–10 injections)

Suitability requirements

Resolution: NLT 4.0 between derivatized glycerin and tributyrin

Relative standard deviation: NMT 2.0% of the ratio of their peak areas

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the response factor, F:

$$F = (A_D/A_S) \times (W_S/W_D)$$

A_D = peak area of tributyrin from the *Standard solution*

A_S = peak area of tripropionin from the *Standard solution*

W_S = weight of glycerin in the *Standard solution* (mg)

W_D = weight of tributyrin in the *Standard solution* (mg)

Calculate the percentage of glycerin in the portion of Glycerol Monostearate taken:

$$\text{Result} = (A_U/A_S) \times (W_D/W_U) \times F \times 100$$

A_U = peak area of tripropionin in the *Sample solution*

A_S = peak area of tributyrin in the *Sample solution*

W_D = weight of tributyrin in 5 mL of *Internal standard solution* (mg)

W_U = weight of Glycerol Monostearate in the *Sample solution* (mg)

Acceptance criteria: NMT 1.2%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** Label it to indicate the name and quantity of any added antioxidant.

Add the following:

▲ Glycerol Tristearate

$C_{57}H_{110}O_6$ 891.49
Octadecanoic acid, 1,1',1''-(1,2,3-propanetriyl) ester;
Octadecanoic acid, 1,2,3-propanetriyl ester;
Glycerol trioctadecanoate;
Tristearoylglycerol [555-43-1].

DEFINITION

Glycerol Tristearate contains NLT 90.0% of triglycerides of saturated fatty acids, chiefly glycerol tristearate ($C_{57}H_{110}O_6$).

IDENTIFICATION

• FATTY ACID COMPOSITION

Boron trifluoride methanol solution: 140 mg/mL of boron trifluoride in methanol

Saturated sodium chloride solution: Mix 1 part of sodium chloride with 2 parts of water, shake from time to time, and allow to stand. Before use, decant the solution from any undissolved substance and filter, if necessary.

Standard solution 1: 0.5 mg/mL of USP Methyl Myristate RS, 2.0 mg/mL of USP Methyl Stearate RS, and 2.0 mg/mL of USP Methyl Oleate RS in *n*-heptane

Standard solution 2: 0.05 mg/mL of USP Methyl Myristate RS, 0.2 mg/mL of USP Methyl Stearate RS and 0.2 mg/mL of USP Methyl Oleate RS in *n*-heptane, diluted from *Standard solution 1*

Standard solution 3: Dissolve a quantity of an ester mixture¹ containing methyl hexanoate, methyl caprylate, methyl caprate, methyl laurate, methyl myristate, methyl palmitate, methyl palmitoleate, methyl stearate, methyl oleate, methyl linoleate, and methyl arachidate in *n*-heptane to make a solution of about 9.0 mg/mL for methyl stearate and 0.1–0.2 mg/mL for each other methyl ester.

Sample solution: Transfer 100 mg of Glycerol Tristearate to a 25-mL conical flask fitted with a suitable water-cooled reflux condenser and a magnetic stir bar. Add 2 mL of a 20-mg/mL solution of sodium hydroxide in methanol, mix, and reflux for about 30 min. Add 2 mL of *Boron trifluoride methanol solution* through the condenser, and reflux for about 30 min. Add 4 mL of *n*-heptane through the condenser, and reflux for 5 min. Cool, remove the condenser, add about 10 mL of *Saturated sodium chloride solution*, and shake. Add a quantity of *Saturated sodium chloride solution* to bring the upper layer up to the neck of the flask, and allow the layers to separate. Collect 2 mL of the *n*-heptane layer (the upper layer); wash with three quantities of water of 2 mL each, and dry the *n*-heptane phase over anhydrous sodium sulfate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m capillary column, bonded with a 1.0-μm layer of phase G16

¹ Ester mixture can be obtained commercially from Nu-Chek-Prep, Inc., P.O. Box 295, Elysian, MN 56028, or from Sigma-Aldrich; or it can be prepared by mixing a commercially available ester mixture with methyl stearate.

Temperatures
Injection port: 250°
Detector: 250°
Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	20	180	—
180	9	240	12

Carrier gas: Helium
Flow rate: 10 mL/min
Injection volume: 2 µL
Injection type: Split ratio, 4:1
System suitability

Samples: *Standard solution 1* and *Standard solution 2*
[NOTE—The relative retention times for methyl myristate, methyl stearate, and methyl oleate are about 0.70, 1.00, and 1.01, respectively.]

Suitability requirements

Resolution: NLT 1.5 between methyl stearate and methyl oleate, *Standard solution 1*

Signal-to-noise ratio: NLT 5 for methyl myristate, *Standard solution 2*

Analysis

Samples: *Standard solution 3* and *Sample solution*
Measure the areas for the peaks of the methyl esters of the fatty acids. Disregard any peaks with an area less than 0.05% of the total area and any peak due to the solvent. [NOTE—Relative retention times for several methyl esters are summarized in Table 2.]

Table 2

Carbon-Chain Length	Number of Double Bonds	Relative Retention Times
12	0	0.58
14	0	0.70
16	0	0.83
18	0	1.00
18	1	1.01
20	0	1.14

Take the main component of *Standard solution 3* as a reference component, and calculate the calibration factor, F_{FA} , for each fatty acid methyl ester:

$$\text{Result} = [(F_{MC} \times P_{FA1} \times A_{MC}) / (P_{MC} \times A_{FA1})] \times 100$$

F_{MC} = factor for the main component, 1
 P_{FA1} = percentage by weight of the fatty acid methyl ester in *Standard solution 3*
 A_{MC} = peak area of the main component in *Standard solution 3*
 P_{MC} = percentage by weight of the main component of *Standard solution 3*
 A_{FA1} = peak area of the fatty acid methyl ester in *Standard solution 3*

Calculate the percentage of the fatty acid methyl ester by weight in the portion of Glyceryl Tristearate taken:

$$\text{Result} = [(A_{FA2} \times F_{FA}) / A_T] \times 100$$

A_{FA2} = peak area of the fatty acid methyl ester in the *Sample solution*
 A_T = sum of the peak areas of the fatty acid methyl esters in the *Sample solution*

Acceptance criteria: Glyceryl Tristearate exhibits the composition profile of fatty acids shown in Table 3.

Table 3

ASSAY

• **CONTENT OF TRIGLYCERIDES**

Mobile phase: Tetrahydrofuran

System suitability solution: 40 mg/mL of USP Glyceryl Distearate RS in *Mobile phase*

Sample solution: 8 mg/mL of Glyceryl Tristearate in *Mobile phase*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.5-mm × 60-cm; 3-µm or 5-µm 100-Å packing L21

Temperature

Detector: 40°

Column: 40°

[NOTE—Two or three 7.5-mm × 30-cm L21 columns may be used in place of the one 60-cm column, provided that system suitability requirements are met. The column temperature may be lowered to ambient temperature, although working at 40° provides stable separation conditions and ensures better sample solubility.]

Flow rate: 1 mL/min

Injection volume: 40 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for triglycerides, diglycerides, monoglycerides, and glycerin are 0.78, 0.81, 0.86, and 1.00, respectively.]

Suitability requirements

Resolution: NLT 1.0 between the diglycerides and the monoglycerides

Relative standard deviation: NMT 2.0%, determined for the monoglycerides peak

Analysis

Samples: *System suitability solution* and *Sample solution*
Calculate the percentage of triglycerides in the portion of Glyceryl Tristearate taken:

$$\text{Result} = (r_U / r_T) \times 100$$

r_U = peak response of the triglycerides in the *Sample solution*

r_T = sum of all the glyceride peak responses from the *Sample solution*

Acceptance criteria: NLT 90.0% of triglycerides

IMPURITIES

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

• **HEAVY METALS, Method II** <231>: NMT 10 ppm

• **ALKALINE IMPURITIES**

Analysis: Prepare a mixture of 2.0 g of Glyceryl Tristearate, 15 mL of alcohol, and 30 mL of ether. Dissolve by gentle heating. Add 0.05 mL of bromophenol blue TS, and titrate with 0.01 N hydrochloric acid VS until the mixture turns yellow.

Acceptance criteria: NMT 0.4 mL of 0.01 N hydrochloric acid is required.

• **LIMIT OF NICKEL**

[CAUTION]—When using closed high-pressure digestion vessels and microwave laboratory equipment, be familiar with the safety and operating instructions given by the manufacturer.]

Magnesium nitrate solution: 10 mg/mL of magnesium nitrate in water

Ammonium dihydrogen phosphate solution: 100 mg/mL of ammonium dihydrogen phosphate in water

Standard stock solution: Transfer 5.0 mL of nickel standard solution TS to a 10-mL volumetric flask, and dilute with water to make a solution containing 5 µg/mL of nickel.

Standard solutions: To four identical 25-mL volumetric flasks, each containing 6 mL of nitric acid, transfer respectively 25, 50, 75, and 100 µL of the *Standard stock solution*. To each flask, add 0.5 mL of *Magnesium nitrate solution* and 0.5 mL of *Ammonium dihydrogen phosphate solution*, and dilute with water to volume. These solutions contain, respectively, 0.005, 0.01, 0.015, and 0.02 µg/mL of nickel.

Sample solution: Transfer 0.25 g of Glyceryl Tristearate to a suitable high-pressure-resistant digestion vessel (fluoropolymer or quartz), and add 6.0 mL of nitric acid and 2.0 mL of 30% hydrogen peroxide. Place the closed vessel in a laboratory microwave oven, and digest using an appropriate program (e.g., 1000 W for 40 min). Allow the digestion vessel to cool before opening. Add 2.0 mL of 30% hydrogen peroxide, and repeat the digestion step. Allow the digestion vessel to cool before opening. Quantitatively transfer the contents to a 25-mL volumetric flask, add 0.5 mL of *Magnesium nitrate solution* and 0.5 mL of *Ammonium dihydrogen phosphate solution*, dilute with water to volume, and mix.

Blank solution: Add 6.0 mL of nitric acid and 2.0 mL of 30% hydrogen peroxide to a high-pressure-resistant digestion vessel, and proceed as directed for the *Sample solution*.

Zero solution: Into a 50.0-mL volumetric flask, introduce 1.0 mL of *Magnesium nitrate solution*, 1.0 mL of *Ammonium dihydrogen phosphate solution*, and 12.0 mL of nitric acid. Dilute with water to volume, and mix.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Maximum absorbance at 232.0 nm

Detection: Graphite furnace

Lamp: Nickel hollow-cathode

Tube: Pyrolytically-coated tube

Other: Background compensation system

Furnace program: See Table 4.

[NOTE—The temperature program may be modified to obtain optimum furnace temperatures.]

Table 4

Step	Dry	Ash	Cool	Atomize
Temperature (°)	120	1100	800	2600
Ramp time (s)	5	30	5	—
Hold time (s)	35	10	5 (decrease)	7

Analysis

Samples: *Blank solution*, *Standard solutions*, and *Sample solution*

Use the *Zero solution* to set the instrument to zero. Concomitantly determine the absorbances of the

Samples at least three times each. Record the average of the steady readings for each of the solutions. If necessary, dilute the *Sample solution* with the *Zero solution* to obtain a reading within the calibrated absorbance range.

Plot the absorbances versus the concentrations of nickel, in µg/mL, in the *Standard solutions*. On the basis of the calibration curve, determine the concentrations of nickel, in µg/mL, in the *Sample solution* and the *Blank solution* from the corresponding absorptions. Obtain the correct concentration of nickel, C_c , in µg/mL, in the *Sample solution*.

Calculate the content of nickel, in µg/g (ppm), in the portion of Glyceryl Tristearate taken:

[NOTE—If the *Sample solution* is diluted with the *Zero solution*, apply an appropriate correction factor for dilution.]

$$\text{Result} = (C_c \times V)/W$$

C_c = concentration of nickel in the *Sample solution* (µg/mL)

V = volume of the *Sample solution*, 25 mL

W = weight of Glyceryl Tristearate taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 1 µg/g (ppm)

SPECIFIC TESTS

• **MELTING RANGE**, *Class II* (741): 69°–73°

• **FATS AND FIXED OILS**, *Acid Value* (401): NMT 1.0

• **FATS AND FIXED OILS**, *Hydroxyl Value* (401): NMT 5.0

Glycine—see *Glycine General Monographs*

Guar Gum

DEFINITION

Guar Gum is a gum obtained from the ground endosperms of *Cyamopsis tetragonolobus* (Linné) Taub. (Fam. Leguminosae). It consists chiefly of a high molecular weight hydrocolloidal polysaccharide, composed of galactan and mannan units combined through glycosidic linkages, which may be described chemically as a galactomannan.

IDENTIFICATION

• **A.**

Sample: 2 g

Analysis: Place the *Sample* in a 400-mL beaker, and moisten it with 4 mL of isopropyl alcohol. Add 200 mL of cold water with vigorous stirring, and continue stirring until the *Sample* is completely and uniformly dispersed.

Acceptance criteria: An opalescent, viscous solution results.

• **B.**

Analysis: Transfer 100 mL of the solution prepared in *Identification test A* to a 400-mL beaker, heat in a boiling water bath for about 10 min, and cool.

Acceptance criteria: No appreciable increase in viscosity is produced. (Distinction from locust bean gum: see *Reagents, Indicators, and Solutions—Reagents*).

ASSAY• **CONTENT OF GALACTOMANNANS**

Analysis: Subtract from 100.0 the total percentages from the tests for *Articles of Botanical Origin*, *Total Ash*, *Acid-Insoluble Matter*, *Protein*, and *Loss on Drying*.

Acceptance criteria: NLT 66.0%

IMPURITIES• **ARSENIC**, *Method II* (211): NMT 3 ppm• **LEAD** (251)

Analysis: Prepare a *Test Preparation* as directed in the chapter, and use 10 mL of *Diluted Standard Lead Solution* (10 µg of Pb) for the test.

Acceptance criteria: NMT 10 ppm

• **HEAVY METALS**, *Method II* (231): NMT 20 ppm**SPECIFIC TESTS**• **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 1.5%• **ACID-INSOLUBLE MATTER**

Sample: 1.5 g

Analysis: Transfer the *Sample* to a 250-mL beaker containing 150 mL of water and 1.5 mL of sulfuric acid. Cover the beaker with a watch glass, and heat the mixture on a steam bath for 6 h, rubbing down the wall of the beaker frequently with a rubber-tipped stirring rod, and replacing any water lost by evaporation. At the end of the 6-h heating period, add 500 mg of a suitable filter aid, and pass through a suitable tared, ashless filter. Wash the residue several times with hot water, dry the filter and its contents at 105° for 3 h, cool in a desiccator, and weigh. Determine the amount of acid-insoluble matter by subtracting the weight of the filter aid from that of the residue.

Acceptance criteria: NMT 7.0%

• **PROTEIN**

Sample: 1.0 g

Analysis: Transfer the *Sample* to a 500-mL Kjeldahl flask, and proceed as directed in *Nitrogen Determination* (461), *Method I*. Determine the percentage of nitrogen. Calculate the amount of protein by multiplying the percentage of nitrogen by 6.25.

Acceptance criteria: NMT 10.0%

• **STARCH**

Analysis: To a solution (1 in 10) of Guar Gum add a few drops of iodine TS.

Acceptance criteria: No blue color is produced.

• **LOSS ON DRYING** (731): Dry a sample at 105° for 5 h: it loses NMT 15.0% of its weight.**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Hexylene Glycol

C₆H₁₄O₂
2,4-Pentanediol, 2-methyl-;
2-Methyl-2,4-pentanediol [107-41-5].

118.17

DEFINITION

Hexylene Glycol is 2-methyl-2,4-pentanediol.

IDENTIFICATION• **A. INFRARED ABSORPTION** (197F)

Sample: Undried specimen

Acceptance criteria: Meets the requirements

SPECIFIC TESTS• **SPECIFIC GRAVITY** (841): 0.917–0.923• **REFRACTIVE INDEX** (831): 1.424–1.430• **ACIDITY**

Sample: 10 mL

Analysis: Mix 1 mL of phenolphthalein TS with 50 mL of water, and add 0.1 N sodium hydroxide until the solution remains pink for 30 s. Add the *Sample*, and titrate with 0.10 N sodium hydroxide until the original pink color returns and remains for 30 s.

Acceptance criteria: NMT 0.20 mL of 0.10 N sodium hydroxide is required.

• **WATER DETERMINATION**, *Method I* (921): NMT 0.5%**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in tight containers.• **USP REFERENCE STANDARDS** (11)

Purified Honey

DEFINITION

Purified Honey is obtained by purification of honey from the comb of the bee, *Apis mellifera* L. and all subspecies of *Apis mellifera*. The honey is extracted by centrifugation, pressure, or other suitable procedures.

IDENTIFICATION• **A.**

Sample solution: 1 in 20 solution

Standard solution: A 7.5 µg/mL solution of USP L-Proline RS

Analysis

Samples: *Standard solution* and *Sample solution*

Place 0.5 mL of the *Sample solution* and the *Standard solution* in separate reaction vials, and add 0.25 mL of formic acid and 1.0 mL of freshly prepared 3% solution of ninhydrin in peroxide-free ethylene glycol monomethyl ether to each vial. Cap the reaction vials tightly, shake well, and place in boiling water for 15 min. Cool for 5 min in a 22° water bath, remove the caps, and add 5.0 mL of 5% aqueous isopropanol solution.

Acceptance criteria: The *Sample solution* shows a purple color similar to, or more intense than that of the *Standard solution*. If necessary, scan the solutions being compared using a suitable spectrophotometer against a water blank. The two solutions each exhibit a maximum at the same wavelength, at about 520 nm. The absorbance of the *Sample solution* should be at least as high as that of the *Standard solution*.

IMPURITIES• **CHLORIDE AND SULFATE**, *Chloride* (221): A 1-g portion shows no more chloride than corresponds to 0.5 mL of 0.020 N hydrochloric acid (0.035%).• **CHLORIDE AND SULFATE**, *Sulfate* (221): A 2-g portion shows no more sulfate than corresponds to 0.5 mL of 0.020 N sulfuric acid (0.024%).• **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 0.3%**SPECIFIC TESTS**• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total bacterial count does

not exceed 10^3 cfu/g. The total combined molds and yeasts count does not exceed 100 cfu/g.

- **SPECIFIC GRAVITY** (841): 1.400–1.435 at 20°
- **REFRACTIVE INDEX** (831): 1.4900–1.4992 at 20°
- **WATER DETERMINATION, Method I** (921): 15.0%–18.6%
- **MICROBIOLOGICAL PROCEDURES FOR ABSENCE OF SPECIFIED MICROORGANISMS** (2022): Where it is intended for use in preparations for infants under one year of age, it meets the requirements of the *Test for Absence of Clostridium Species*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.
- **LABELING:** Label it to indicate that it is not intended for use in preparations for infants under one year of age, unless it meets the requirements of the *Test for Absence of Clostridium Species*.
- **USP REFERENCE STANDARDS** (11)
USP L-Proline RS

Hydrochloric Acid

HCl 36.46
Hydrochloric acid [7647-01-0].

DEFINITION

Hydrochloric Acid contains NLT 36.5% and NMT 38.0%, by weight, of HCl.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Chloride** (191)

ASSAY

• PROCEDURE

Sample: 3 mL

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 1 N sodium hydroxide VS

Blank: 45 mL of water

Endpoint detection: Visual

Analysis: Place the *Sample* in a glass-stoppered flask, previously tared while containing about 20 mL of water, and weigh again to obtain the weight of the substance under assay. Dilute with 25 mL of water, and add methyl red TS. Titrate with 1 N sodium hydroxide VS. Calculate the percentage of hydrochloric acid (HCl) in the *Sample* taken:

$$\text{Result} = [(V_S - V_B) \times N \times F] / W \times 100$$

V_S = volume of *Titrant* consumed by the *Sample* (mL)

V_B = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 36.46 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 36.5%–38.0%

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 20 mL

Analysis: To the *Sample*, add 2 drops of sulfuric acid, evaporate to dryness, and ignite.

Acceptance criteria: NMT 2 mg of residue remains (about 0.008%).

• HEAVY METALS (231)

Sample: 3.4 mL (4 g)

Analysis: Evaporate the *Sample* on a steam bath to dryness, add 2 mL of 1 N acetic acid to the residue, and dilute with water to 25 mL.

Acceptance criteria: NMT 5 ppm

SPECIFIC TESTS

• BROMIDE OR IODIDE

Sample solution: 1 part Hydrochloric Acid to 2 parts water

Analysis: Add 1 mL of chloroform to 10 mL of the *Sample solution*. Cautiously add, dropwise, with constant agitation, chlorine TS that has been diluted with an equal volume of water.

Acceptance criteria: The chloroform remains free from even a transient yellow, orange, or violet color.

• FREE BROMINE OR CHLORINE

Sample solution: 1 part Hydrochloric Acid to 2 parts water

Analysis: Add 1 mL of potassium iodide TS and 1 mL of chloroform to 10 mL of the *Sample solution*, and agitate the mixture.

Acceptance criteria: The chloroform remains free from any violet color for at least 1 min.

• SULFATE

Sample solution: 1 part Hydrochloric Acid to 2 parts water

Analysis: To a mixture of 3 mL of the *Sample solution* and 5 mL of water, add 5 drops of barium chloride TS.

Acceptance criteria: Neither turbidity nor precipitate appears within 1 h.

• SULFITE

Sample solution: 1 part Hydrochloric Acid to 2 parts water

Analysis: Complete the test for *Sulfate*, then add to the liquid 2 drops of 0.1 N iodine.

Acceptance criteria: Neither turbidity nor decolorization of the iodine occurs.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Diluted Hydrochloric Acid

DEFINITION

Diluted Hydrochloric Acid contains, in each 100 mL, NLT 9.5 g and NMT 10.5 g of hydrochloric acid (HCl).

Diluted Hydrochloric Acid may be prepared as follows.

Hydrochloric Acid	226 mL
Purified Water, a sufficient quantity to make	1000 mL

Mix the ingredients.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Chloride** (191)

ASSAY

• PROCEDURE

Sample: 10.0 mL

Blank: 20 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a conical flask, and add about 20 mL of water. Add 3 drops of methyl red TS.

Titrate with *Titrant*. Perform a blank determination.

Calculate the amount of hydrochloric acid (HCl) in the portion of sample taken:

$$\text{Result} = (V_S - V_B) \times N \times F$$

V_S = Titrant volume consumed by the *Sample* (mL)

V_B = Titrant volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 3.646×10^{-2} g/mEq

Acceptance criteria: 9.5–10.5 g of HCl in each 100 mL

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 20 mL

Analysis: To the *Sample* add 2 drops of sulfuric acid, evaporate to dryness, and ignite.

Acceptance criteria: NMT 2 mg

• HEAVY METALS (231)

Test preparation: To 3.8 mL (4 g) of Diluted Hydrochloric Acid add 5 mL of water and 1 drop of phenolphthalein TS. Add 6 N ammonium hydroxide until the solution assumes a faint pink color. Add 2 mL of 1 N acetic acid, then add water to make 25 mL.

Acceptance criteria: NMT 5 µg/g

• FREE BROMINE OR CHLORINE

Sample: 10 mL

Analysis: To the *Sample* add 1 mL of potassium iodide TS and 1 mL of chloroform, and agitate the mixture.

Acceptance criteria: The chloroform remains free from any violet coloration for at least 1 min.

• SULFATE

Sample solution: Mix 3 mL of Diluted Hydrochloric Acid and 5 mL of water.

Analysis: To the *Sample solution* add 5 drops of barium chloride TS.

Acceptance criteria: Neither turbidity nor precipitate appears within 1 h.

• SULFITE

Analysis: Complete the test for *Sulfate*, then add to the liquid 2 drops of 0.1 N iodine.

Acceptance criteria: Neither turbidity nor decolorization of the iodine occurs.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Hydroxyethyl Cellulose

Cellulose, 2-hydroxyethyl ether [9004-62-0].

DEFINITION

Hydroxyethyl Cellulose is a partially substituted poly(hydroxyethyl) ether of cellulose. It is available in several grades, varying in viscosity and degree of substitution, and some grades are modified to improve their dispersion in water. It may contain suitable anticaking agents.

IDENTIFICATION

• A.

Sample solution: 1 g in 100 mL of water

Analysis: Stir the *Sample solution*.

Acceptance criteria: It dissolves completely to produce a colloidal solution that remains clear when heated to 60°.

• B.

Sample: 1 mL of the solution from *Identification* test A

Analysis: Place the *Sample* on a glass plate, and allow to evaporate.

Acceptance criteria: A thin, self-sustaining film is formed.

• C.

Sample solution: 1 in 2000

Analysis: To 1 mL of the *Sample solution* add 1 mL of phenol solution (50 mg/mL), then add 5 mL of sulfuric acid, shake, and allow to cool.

Acceptance criteria: The color of the solution becomes orange.

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 5.0%

- **LEAD (251):** NMT 10 µg/g

- **HEAVY METALS, Method II (231):** NMT 20 µg/g

SPECIFIC TESTS

• PH (791)

Sample solution: 10 mg/mL

Acceptance criteria: 6.0–8.5

• LOSS ON DRYING (731)

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 10.0%

- **VISCOSITY—CAPILLARY VISCOMETER METHODS (911) and ROTATIONAL RHEOMETER METHODS (912):** When determined at the concentration and under the conditions specified in the labeling, its viscosity is NLT 50% and NMT 150% of the labeled viscosity, where stated as a single value, or it is between the maximum and minimum values, where stated as a range of viscosities.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **LABELING:** The labeling indicates its viscosity, under specified conditions, in aqueous solution. The indicated viscosity may be in the form of a range encompassing 50%–150% of the average value.

Hydroxypropyl Betadex

$C_{42}H_{70}O_{35}(C_3H_6O)_x$ where $x = 7 \times MS$, MS being molar substitution

Beta cyclodextrin, 2-hydroxypropyl ether [94035-02-6].

DEFINITION

Hydroxypropyl Betadex is a partially substituted poly(hydroxypropyl) ether of Betadex. The number of hydroxypropyl groups per anhydroglucose unit expressed as molar substitution (MS) is NLT 0.40 and NMT 1.50 and is within 10% of the value stated on the label.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K):** The spectrum obtained with Hydroxypropyl Betadex shows the same absorption bands as the spectrum acquired with USP Hydroxypropyl Betadex RS. Due to the difference in the substitution of the substance, the intensity of some absorption bands may vary.

- **B.** It meets the requirements of the test for *Clarity of Solution*.

ASSAY• **MOLAR SUBSTITUTION**

(See *Nuclear Magnetic Resonance* <761>.)

The molar substitution (MS) is calculated from the ratio between the signal from the three protons of the methyl group, contained in the hydroxypropyl functional group, and the signal from the proton attached to the carbon C₁ (glycosidic proton) of the anhydroglucose units.

Use a Fourier-transform nuclear magnetic resonance (NMR) spectrometer having a magnetic field strength of at least 6 Tesla and that is capable of performing quantitative analysis using proton NMR spectroscopy at a temperature of at least 25°.

Sample solution: Mix NLT the equivalent of 10.0 mg of dried Hydroxypropyl Betadex with 0.75 mL of deuterium oxide thoroughly in an NMR tube. Place the tube into an NMR probe.

Analysis: Adjust the spectrometer settings so that a high-resolution proton NMR spectrum can be acquired that will provide quantitative data. Acquire a free induction decay (FID) with at least 8 transients using a spectral window from at least 0–6.2 ppm, with the solvent peak located at 4.8 ppm at 25°. Zero fill the spectrum at least three times, and Fourier transform the FID with no Gaussian line broadening and no more than 0.2 Hz of Lorentzian line broadening.

Determine the peak areas of the doublet from the methyl protons of the hydroxypropyl functional group at 1.2 ppm (*A*₁) and the peak areas from the glycosidic protons, which are located between 5 and 5.4 ppm (*A*₂).

Calculate the MS:

$$\text{Result} = A_1/(3A_2)$$

*A*₁ = area of the methyl group of hydroxypropyl

*A*₂ = area of the glycosidic proton

The degree of substitution is the number of hydroxypropyl groups per molecule of betadex and is obtained by multiplying the MS by 7.

Acceptance criteria: 0.40–1.50 and within 10% of the value stated on the label

IMPURITIES

- **HEAVY METALS,** *Method I* (231): NMT 20 µg/g
- **LIMIT OF BETADEX, PROPYLENE GLYCOL, AND OTHER RELATED SUBSTANCES**

Mobile phase: Water

Standard solution A: 15 mg/mL of USP Beta Cyclodextrin RS and 25 mg/mL of USP Propylene Glycol RS

Standard solution B: 1.0 mL of *Standard solution A* diluted with water to 10.0 mL

Sample solution: Dissolve 2.50 g of Hydroxypropyl Betadex, accurately weighed and calculated on the dried basis, in water with the aid of heat. Cool, and dilute with water to 25.0 mL. The resulting solution is 100 mg/mL of Hydroxypropyl Betadex, calculated on the dried basis, in water.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Differential refractometer

Columns

Guard: Packing L11

Analytical: 3.9-mm × 30-cm; packing L11

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution A* and *Standard solution B*

[NOTE—The retention time of propylene glycol is about 2.5 min, and the relative retention times with reference to that of propylene glycol for betadex and hydroxypropyl betadex are about 4.2 and about 6, respectively; Hydroxypropyl Betadex elutes as a very wide peak or several peaks.]

Suitability requirements

Resolution: NLT 4 between betadex and propylene glycol, *Standard solution A*

Relative standard deviation: NMT 2.0%, *Standard solution B*

Analysis

Samples: *Standard solution B* and *Sample solution*

Acceptance criteria: Disregard any peaks eluting before propylene glycol and after the hydroxypropyl betadex peak.

Betadex: NMT 1.5%; the area of the betadex peak in the *Sample solution* is NMT the area of the corresponding peak from *Standard solution B*.

Propylene glycol: NMT 2.5%; the area of the propylene glycol peak in the *Sample solution* is NMT the area of the corresponding peak from *Standard solution B*.

Any other single impurity: NMT 0.25%; the area from any other single impurity peak is NMT 0.1 times the area of propylene glycol in the chromatogram of *Standard solution B*.

Total impurities excluding betadex and propylene glycol: NMT 1%; the total area from all impurity peaks, excluding betadex and propylene glycol, is NMT 0.4 times the area of propylene glycol from *Standard solution B*.

Disregard limit: 0.1%; disregard any peaks that are less than 0.04 times the area of propylene glycol from *Standard solution B*.

• **LIMIT OF PROPYLENE OXIDE**

Ether stock solution: Add 75 µL of ether to 30 mL of dimethylacetamide in a 50-mL volumetric flask, dilute with dimethylacetamide to volume, and mix. This solution contains 1.0 mg/mL of ether.

Internal standard solution: Add 30 µL of *Ether stock solution* to 70 mL of dimethylacetamide in a 100-mL volumetric flask, dilute with dimethylacetamide to volume, and mix.

Propylene oxide stock solution

[CAUTION—Propylene oxide is toxic and flammable.

Prepare this solution in a well-ventilated fume hood.]

Add 30 mL of dimethylacetamide into a 50-mL volumetric flask. Weigh the flask and contents accurately, add 60 µL of propylene oxide (cooled in a refrigerator) into the flask with a 100-µL cooled microsyringe, weigh again, and calculate the weight of propylene oxide added, by difference. Dilute with dimethylacetamide to volume, and mix. This solution contains 1.0 mg/mL of propylene oxide.

[NOTE—Propylene oxide is a gas at room temperature. It is usually stored in a lecture-type gas cylinder or small metal pressure bomb. Chill the cylinder in a refrigerator before use. Transfer 5 mL of the liquid propylene oxide to a 100-mL beaker chilled in wet ice. Use a gas-tight syringe that has been chilled in a refrigerator.]

System suitability solution: Add 30 µL of *Ether stock solution* and 20 µL of *Propylene oxide stock solution* to 70 mL of dimethylacetamide in a 100-mL volumetric

flask, dilute with dimethylacetamide to volume, and mix.

Standard stock solutions: Add 7 mL of dimethylacetamide into each of four 10-mL volumetric flasks.

Transfer the following amounts of *Propylene oxide stock solution* into each of the four flasks using a microsyringe, with one amount per flask: 40, 100, 200, and 400 μL . Dilute with dimethylacetamide to volume, and mix. The *Standard stock solutions* contain about 4, 10, 20, and 40 $\mu\text{g}/\text{mL}$ of propylene oxide, respectively.

Standard solutions: Into each of four 10-mL headspace vials, transfer 200 ± 5 mg of Hydroxypropyl Betadex, calculated on the dried basis. Pipet 1.0 mL of the *Internal standard solution* into each vial, and close the vial with septum and cap. Into each of the vials add 10 μL of each of the *Standard stock solutions* using a 10- μL syringe, respectively. Allow each vial to stand, and gently shake until the sample is dissolved. The *Standard solutions* contain, respectively, about 0.04, 0.1, 0.2, and 0.4 $\mu\text{g}/\text{mL}$ of propylene oxide.

Sample solution: Transfer 200 ± 5 mg of Hydroxypropyl Betadex, calculated on the dried basis, into a 10-mL headspace autosampler vial. Pipet 1.0 mL of the *Internal standard solution* into the vial, and close the vial with a septum and cap. Add 10 μL of dimethylacetamide using a 10- μL syringe. Allow the vial to stand, and gently shake until the sample is dissolved.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC with a balanced pressure automatic headspace sampler

Detector: Flame ionization

Column: 0.32-mm \times 10-m fused-silica capillary; coated with a 10- μm layer of stationary phase S3

Temperatures

Injection port: 120°

Detector: 250°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	—	50	10
50	10	100	10
100	20	220	4

Transfer line: 120°

Carrier gas: Helium

Flow rate: 2 mL/min, corresponding to the linear velocity of 44 cm/s

Injection volume: 1.0 mL

Injection type: Split injection; the split ratio is 1:1.

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for propylene oxide and ether are about 1.0 and 1.3, respectively.]

Suitability requirements

Resolution: NLT 2.0 between ether and propylene oxide

Analysis

Samples: *Standard solutions* and *Sample solution*

Separately place the vials containing the *Standard solutions* and the *Sample solution* in the automated sampler, and start the sequence so that the vial is heated at a temperature of 100° for 30 min before a suitable portion of its headspace is injected into the chromatograph.

Using a 2-mL gas syringe preheated in an oven at 110°, separately inject the headspace from each vial into the chromatograph. Chromatograph the *Standard solutions* and the *Sample solution*, record the chromatograms,

and measure the area ratios of the peak responses of propylene oxide and ether.

Determine, based on a retention time comparison, whether propylene oxide is detected in the *Sample solution*. Plot the area ratios of the peak responses of propylene oxide and ether of the *Sample solution* and the *Standard solutions* versus the content, in μg , of propylene oxide in each vial, as furnished by the *Standard stock solutions*, draw the straight line best fitting the five points, and calculate the correlation coefficient for the line. [NOTE—The *Sample solution* should be plotted as if it had a content of added propylene oxide equivalent to 0 μg .]

A suitable system is one that yields a line having a correlation coefficient of NLT 0.99. Extrapolate the line until it meets the content axis on the negative side. The distance between this point and the intersection of the axes represents the total amount, T_u , in μg , of propylene oxide in the *Sample solution*.

Calculate the percentage of propylene oxide in the portion of sample taken:

$$\text{Result} = (T_u/W) \times 100$$

T_u = total amount of propylene oxide from the graph in the *Sample solution* (μg)

W = weight of Hydroxypropyl Betadex taken to prepare the *Sample solution* (μg)

Acceptance criteria: NMT 0.0001%

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g.

• **LOSS ON DRYING** <731>

Sample: 1 g

Analysis: Dry the *Sample* at 120° for 2 h.

Acceptance criteria: NMT 10.0%

• **CLARITY OF SOLUTION**

Sample: 1.0 g

Analysis: Dissolve the *Sample* in 2.0 mL of water, and heat.

Acceptance criteria: The resulting solution is clear and remains transparent after cooling to room temperature.

• **BACTERIAL ENDOTOXINS TEST** <85>: The level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Hydroxypropyl Betadex is used can be met. Where the label states that Hydroxypropyl Betadex must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Hydroxypropyl Betadex is used can be met.

• **STERILITY TESTS** <71>: Where the label states that Hydroxypropyl Betadex is sterile, it meets the requirements for *Sterility Tests* <71> in the relevant dosage form monograph(s) in which Hydroxypropyl Betadex is used.

• **CONDUCTIVITY**

Sample solution: 100 mg/mL of Hydroxypropyl Betadex, calculated on the dried basis in previously boiled and cooled to room temperature water

Apparatus: Use a conductivity meter or resistivity meter that measures the resistance of the column of liquid between the electrodes of the immersed measuring device. The apparatus is supplied with alternating current to avoid the effects of electrode polarization. It is equipped with a temperature compensation device or a precision thermometer.

Standard solutions: Prepare three standard solutions of potassium chloride containing 0.7455, 0.0746, and 0.0149 g, respectively, of potassium chloride per 1000.0 g of solution. These solutions should be

prepared using water, which has been previously boiled and cooled to room temperature and has conductivity that does not exceed $2 \mu\text{S} \cdot \text{cm}^{-1}$. The conductivity and resistivity of these three *Standard solutions* at 20° are given in *Table 2*.

Table 2

Concentration of Solution (g/1000.0 g)	Conductivity ($\mu\text{S} \cdot \text{cm}^{-1}$)	Resistivity ($\Omega \cdot \text{cm}$)
0.7455	1330	752
0.0746	133.0	7519
0.0149	26.6	37,594

Calibration**Samples:** *Standard solutions*

Choose a conductivity cell that is appropriate for the conductivity of the solution to be examined. The higher the expected conductivity, the higher the cell constant that must be chosen. Commonly used conductivity cells have cell constants on the order of 0.1, 1, and 10 cm^{-1} . Use a *Standard solution* of potassium chloride that is appropriate for the measurement. The conductivity value of the *Standard solution* of potassium chloride should be near the expected conductivity value of the *Sample solution*.

Rinse the cell several times with water, which has been previously boiled and cooled to room temperature, and at least twice with the *Standard solution* (potassium chloride solution) used for the determination of the cell constant of the conductivity cell.

Measure the resistance of the conductivity cell using the *Standard solution* (potassium chloride solution) at $20 \pm 0.1^\circ$.

Calculate the constant of the conductivity cell, C (in cm^{-1}):

$$C = R_{KCl} \times K_{KCl}$$

R_{KCl} = measured resistance, expressed in mega-ohms

K_{KCl} = conductivity of the *Standard solution* of potassium chloride used, expressed in $\mu\text{S} \cdot \text{cm}^{-1}$

Calibration acceptance criteria: The measured constant, C , of the conductivity cell must be within 5% of the given value.

Analysis**Sample:** *Sample solution*

Rinse the conductivity cell several times with water, which has been previously boiled and cooled to room temperature, and at least twice with the *Sample solution*. Measure the conductivity of the *Sample solution*, while gently stirring with a magnetic stirrer.

Acceptance criteria: NMT $200 \mu\text{S} \cdot \text{cm}^{-1}$

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
- **LABELING:** Label it to indicate the molar substitution (MS). Where Hydroxypropyl Betadex is intended for use in the manufacture of injectable dosage forms, it is so labeled. Where Hydroxypropyl Betadex must be subjected to further processing during the preparation of injectable dosage forms to ensure acceptable levels of bacterial endotoxins, it is so labeled. Where Hydroxypropyl Betadex is sterile, it is so labeled.
- **USP REFERENCE STANDARDS (11)**
 - USP Beta Cyclodextrin RS
 - USP Endotoxin RS
 - USP Hydroxypropyl Betadex RS
 - USP Propylene Glycol RS

Hydroxypropyl Cellulose

Cellulose, 2-hydroxypropyl ether [9004-64-2].

DEFINITION

Hydroxypropyl Cellulose is a partially substituted poly(hydroxypropyl) ether of cellulose. It may contain NMT 0.60% of silica or other suitable anticaking agents. When dried at 105° for 1 h, it contains NMT 80.5% of hydroxypropoxy groups.

IDENTIFICATION

- **INFRARED ABSORPTION (197K):** [NOTE—The spectrum may or may not contain a peak at about 1719 cm^{-1} .]

ASSAY• **HYDROXYPROPOXY GROUPS**

Apparatus: The apparatus for hydroxypropoxy group determinations is shown in *Figure 1*.

Figure 1. Apparatus for hydroxypropoxy determination.

The boiling or reaction flask, consisting of a 125-mL conical-bottom boiling flask modified to provide a thermocouple (or thermometer) well and an inlet with a 1.0-mm capillary tip for nitrogen and water (see *Figure 2*), is fitted with a distillation head that leads to a condenser. The reaction flask is immersed in an oil bath equipped with an electric heater capable of heating the bath at the desired rate and maintaining the temperature at 155° . The distillate is collected in a flask.

[NOTE—The tube from the condenser to the flask must be below the surface of the liquid in the flask to ensure the capture of all of the acetic acid formed. See *Figure 1*.]

Figure 2. Boiling flask.

Analysis: Transfer 65 mg of Hydroxypropyl Cellulose, previously dried at 105° for 1 h, into the reaction flask. Add 5 mL of water, and swirl gently for 5 min. Add 10 mL of chromium trioxide solution (30 g in 70 mL). Assemble the apparatus as shown in Figures 1 and 2, and immerse the reaction flask in the oil bath slightly above the level of the chromium trioxide solution. Start the condenser cooling water, and pass nitrogen gas through the flask at a rate of about 70–75 mL/min. Raise the temperature of the oil bath to 155° during a 30-min period, and maintain it at this temperature throughout the determination. [NOTE—Too rapid an initial rise in temperature results in high blank determinations.]

Monitor the temperature of the reaction mixture in the reaction flask using a thermocouple or thermometer in a well, as shown in Figures 1 and 2. When a reaction mixture temperature of 102 ± 1° is reached, add water through the water inlet until the reaction mixture temperature drops to 97 ± 1°. Continue this 97° to 102° temperature cycle until 100 mL of distillate has been collected. Detach the condenser from the distillation head, and wash with water, collecting the washings in the flask containing the distillate. Titrate the solution with 0.02 N sodium hydroxide VS to a pH of 7.0 ± 0.1, using an expanded-scale pH meter equipped with glass and calomel electrodes. Record the volume, V, of the 0.02 N sodium hydroxide used, then add 500 mg of sodium bicarbonate and 10 mL of 2 N sulfuric acid. After evolution of carbon dioxide has ceased, add 1 g of potassium iodide, insert the stopper in the flask, shake the mixture, and allow the solution to stand in the dark for 5 min. Titrate the liberated iodine with 0.02 N sodium thiosulfate VS to the sharp disappearance of the yellow iodine color, adding a few drops of starch TS to confirm the endpoint. Record the volume, Y, required. This titration, Y mL, multiplied by the empirical factor, K, appropriate to the particular apparatus and reagents in use (see the calculation below), gives the acid equiv-

alent not caused by acetic acid. The acetic acid equivalent is (V – KY) mL of 0.02 N sodium hydroxide. Obtain the empirical factor, K, for the apparatus by performing a blank determination in which the Hydroxypropyl Cellulose is omitted. The acidity of the blank for a given apparatus and given reagents is in a fixed ratio to the oxidizing equivalent of the distillate in terms of sodium thiosulfate:

$$\text{Result} = (V_B \times N_1) / (Y_B \times N_2)$$

V_B = volume of 0.02 N sodium hydroxide required in the blank run (mL)

N_1 = normality of the 0.02 N sodium hydroxide

Y_B = volume of 0.02 N sodium thiosulfate required in the blank run (mL)

N_2 = normality of the 0.02 N sodium thiosulfate
Calculate the percentage of hydroxypropoxy groups (–OCH₂CHOHCH₃):

$$\text{Result} = (V_A N_1 - K Y_A N_2) \times (0.079/W) \times 100$$

V_A = volume of 0.02 N sodium hydroxide required for titration of the sample (mL)

N_1 = normality of the 0.02 N sodium hydroxide

K = empirical factor

Y_A = volume of 0.02 N sodium thiosulfate required for titration of the sample (mL)

N_2 = normality of the 0.02 N sodium thiosulfate
W = quantity of sample used (g)

Each mL of 0.02 N sodium hydroxide is equivalent to 1.502 mg of hydroxypropoxy groups (–OCH₂CHOHCH₃).

The results obtained as a percentage of hydroxypropoxy content may be converted to terms of average molecular substitution of glucose units by means of the graph in Figure 3.

Figure 3. Graph for converting percentage of substitution, by weight, of hydroxypropoxy groups to molecular substitution/glucose unit.

Acceptance criteria: NMT 80.5% of hydroxypropoxy groups

IMPURITIES

Inorganic Impurities

• RESIDUE ON IGNITION (281)

[CAUTION—Perform the mixing and heating of the mixtures containing hydrofluoric acid in a well-ventilated hood.]

Analysis: Proceed as directed for *Residue on Ignition* (281), using a platinum crucible if silica may be present. If more than 0.2% residue is found, and silica is present, moisten the residue with water, and add 5 mL of hydrofluoric acid, in small portions. Evaporate on a steam bath to dryness, and cool. Add 5 mL of hydrofluoric acid and 0.5 mL of sulfuric acid, and

evaporate to dryness. Slowly increase the temperature until all of the acids have been volatilized, and ignite at $1000 \pm 25^\circ$. Cool in a desiccator, and weigh: the difference between the final weight and the weight of the initially ignited portion represents the weight of silica.

Acceptance criteria: The final weight is NMT 0.2% of the weight of the sample taken for the ignition.

- **LEAD** (251): NMT 10 ppm
- **HEAVY METALS**, *Method II* (231): NMT 20 ppm

SPECIFIC TESTS

- **pH** (791): 5.0–8.0, in a solution (1 in 100)
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 5.0% of its weight.
- **ROTATIONAL RHEOMETER METHODS** (912): Determine the apparent viscosity at the concentration and temperature specified on the label with a suitable rotational viscometer (see *Labeling*).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store in well-closed containers.
- **LABELING:** Label it to indicate the viscosity in an aqueous solution of stated concentration and temperature. The indicated viscosity may be in the form of a range encompassing 50%–150% of the average value.
- **USP REFERENCE STANDARDS** (11)
USP Hydroxypropyl Cellulose RS

Low-Substituted Hydroxypropyl Cellulose

DEFINITION

Low-Substituted Hydroxypropyl Cellulose is a low-substituted hydroxypropyl ether of cellulose. When dried at 105° for 1 h, it contains NLT 5.0% and NMT 16.0% of hydroxypropoxy groups ($-\text{OCH}_2\text{CHOHCH}_3$).

IDENTIFICATION

- **A.**
Sample: 20 mg
Analysis: Shake the *Sample* with 2 mL of water, and cautiously add 1 mL of a solution of anthrone in sulfuric acid (350 $\mu\text{g/mL}$).
Acceptance criteria: A blue to greenish-blue color develops at the zone of contact.
- **B.**
Sample: 0.1 g
Analysis: Shake the *Sample* thoroughly with 10 mL of water. Add 1 g of sodium hydroxide, and shake until it becomes homogeneous. Save 5 mL of this solution for *Identification* test C. To 0.1 mL of this solution add 9 mL of 32 N sulfuric acid, and shake. Heat in a water bath for 3 min, accurately timed, and immediately cool in an ice bath. While the mixture is cold, carefully add 0.6 mL of ninhydrin TS. Allow to stand at room temperature.
Acceptance criteria: The red color that appears immediately turns to violet within 100 min.
- **C.**
Sample solution: 5 mL of the solution prepared for *Identification* test B
Analysis: Shake the *Sample solution* with 10 mL of a mixture of acetone and methanol (4:1).
Acceptance criteria: A white, flocculent precipitate is formed.

ASSAY

PROCEDURE

[CAUTION]—Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps of the *Standard solution* and the *Sample solution* in a properly functioning hood.

Specific safety practices to be followed are to be identified to the analyst performing this test.]

Apparatus: For the reaction vial, use a 5-mL pressure-tight serum vial, 50 mm in height, 20 mm in outside diameter, and 13 mm in inside diameter at the mouth. The vial is equipped with a pressure-tight septum having a polytetrafluoroethylene-faced butyl rubber and an air-tight seal using an aluminum crimp or any sealing system that provides sufficient air-tightness. Use a heater having a heating module that has a square-shape aluminum block with holes 20 mm in diameter and 32 mm in depth, into which the reaction vial fits. The heating module is also equipped with a magnetic stirrer capable of mixing the contents of the vial, or use a reciprocal shaker that performs a reciprocating motion of approximately 100 times/min.

Hydriodic acid: Use a reagent having a typical concentration of HI about 57%.

Internal standard solution: 30 mg/mL of *n*-octane in *o*-xylene

Standard solution: Into a suitable serum vial, weigh between 60 and 100 mg of adipic acid, and add 2.0 mL of *Hydriodic acid* and 2.0 mL of *Internal standard solution* into the vial. Close the vial securely with a suitable septum stopper. Weigh the vial and contents, add 15–22 μL of isopropyl iodide through the septum with a syringe, weigh again, and calculate the weight of isopropyl iodide added, by difference. Use the upper layer as the *Standard solution*.

Sample solution: Transfer 0.065 g of dried Low-Substituted Hydroxypropyl Cellulose to a 5-mL thick-walled reaction vial equipped with a pressure-tight septum-type closure, add between 60 and 100 mg of adipic acid, and pipet 2.0 mL of *Internal standard solution* into the vial. Cautiously pipet 2.0 mL of *Hydriodic acid* into the mixture, immediately cap the vial tightly, and weigh. Using the magnetic stirrer equipped in the heating module, or using a reciprocal shaker, mix the contents of the vial continuously, heating and maintaining the temperature of the contents at $130 \pm 2^\circ$ for 60 min. If a reciprocal shaker or magnetic stirrer cannot be used, shake the vial well by hand at 5-min intervals during the initial 30 min of the heating time. Allow the vial to cool, and weigh. If the weight loss is greater than or equal to 0.50% of the contents or there is evidence of a leak, discard the mixture, and prepare another *Sample solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Thermal conductivity or hydrogen flame ionization

Column: 3–4-mm \times 1.8–3-m glass, packed with 20% liquid phase G28 on 100–120 mesh support S1C that is not silanized. [NOTE—Use a column giving well resolved peaks of methyl iodide, isopropyl iodide, and the internal standard in this order.]

Carrier gas: Helium is used for the thermal conductivity detector; helium or nitrogen can be used for the hydrogen flame-ionization detector.

Column temperature: 100°

Flow rate: With the *Standard solution*, adjust the flow rate so that the retention time of the internal standard is about 10 min.

Injection volume: 1–2 μL

Analysis

Samples: Upper layer of the *Standard solution* and the *Sample solution*

Calculate the percentage of hydroxypropoxy ($-\text{OC}_3\text{H}_6\text{OH}$) in the sample taken:

$$\text{Result} = (Q_{Tb}/Q_{Sb}) \times (W_{Sb}/W_U) \times 44.17$$

Q_{Tb} = ratio of the peak area of isopropyl iodide to *n*-octane in the *Sample solution*

- Q_{sb} = ratio of the peak area of isopropyl iodide to *n*-octane in the *Standard solution*
 W_{sb} = weight of isopropyl iodide in the *Standard solution* (mg)
 W_u = weight of Low-Substituted Hydroxypropyl Cellulose calculated on the dried basis, taken for the *Sample solution* (mg)
Acceptance criteria: 5.0%–16.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%
- **CHLORIDE AND SULFATE**, *Chloride* (221)
Sample solution: Shake 0.50 g of Low-Substituted Hydroxypropyl Cellulose thoroughly with 30 mL of boiling water, heat on a water bath for 10 min, and filter the supernatant by decantation while hot. Wash the residue thoroughly with 50 mL of boiling water, combine the washings with the filtrate, and add water to make 100 mL after cooling.
Control solution: 0.25 mL of 0.02 N hydrochloric acid
Analysis: Using 10 mL of the *Sample solution* and the *Control solution*, proceed as directed in the chapter, starting with the addition of the nitric acid.
Acceptance criteria: NMT 0.36%; the *Sample* shows no more chloride than the *Control solution*.
- **HEAVY METALS**, *Method II* (231): NMT 10 µg/g

SPECIFIC TESTS

- **LOSS ON DRYING** (731)
Analysis: Dry at 105° for 1 h.
Acceptance criteria: NMT 5.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Hydroxypropyl Methylcellulose—see Hypromellose General Monographs

Hymetellose

Methylhydroxyethylcellulose;
 Cellulose 2-hydroxyethyl methyl ether [9032-42-2].

DEFINITION

Hymetellose is a partly *O*-(methylated) and *O*-(2-hydroxyethylated) cellulose.

IDENTIFICATION

- **A.**
Sample solution: Use the *Sample solution* prepared in the test for *Color of Solution*.
Analysis: Heat the *Sample solution* in a water bath while stirring.
Acceptance criteria: At a temperature above 50°, the solution becomes cloudy or a flocculent precipitate is formed. The solution becomes clear again on cooling.
- **B.**
Sample solution: 1 mL of the solution from *Identification test A*
Analysis: Transfer the *Sample solution* to a glass plate, and allow the water to evaporate.
Acceptance criteria: A thin film is formed.
- **C.**
Sample solution: 10 mL of the solution from *Identification test A*
Analysis: To the *Sample solution* add 0.3 mL of 2 N acetic acid and 2.5 mL of tannic acid TS.
Acceptance criteria: A yellowish-white, flocculent precipitate is formed that dissolves in ammonia TS.

• **D.**

Sample: 1 g
Diethanolamine–sodium nitroprusside solution: 50 mg/mL of sodium nitroprusside solution adjusted with 1 N hydrochloric acid to a pH of 9.8. Mix 11 mL of this solution with 1 mL of a diethanolamine solution (200 mg/mL) in water.

Analysis: In a test tube about 160 mm long, thoroughly mix the *Sample* with 2 g of finely powdered manganese sulfate. Introduce, to a depth of 2 cm into the upper part of the tube, a strip of filter paper impregnated with a freshly prepared *Diethanolamine–sodium nitroprusside solution*. Insert the tube 8 cm into a silicone-oil bath at 190°–200°. Perform a blank test without the addition of Hymetellose.

Acceptance criteria: The filter paper becomes blue within 10 min.

• **E.**

Sample: 0.2 g
Analysis: Dissolve the *Sample* completely, without heating, in 15 mL of 70% sulfuric acid. Pour the solution while stirring into 100 mL of ice water, and dilute with ice water to 250 mL. Transfer 1 mL of this solution to a test tube, and while cooling in ice water, add dropwise 8 mL of sulfuric acid, and mix thoroughly. Heat in a water bath for exactly 3 min, and immediately cool in ice water. While the mixture is cold, carefully add 0.6 mL of ninhydrin TS, and mix well. Allow to stand at 25°.

Acceptance criteria: A pink color is produced immediately and does not become violet within 100 min.

IMPURITIES

- **RESIDUE ON IGNITION** (281)
Sample: 1.0 g
Acceptance criteria: NMT 1.0%
- **CHLORIDE AND SULFATE**, *Chloride* (221)
Sample solution: Dilute 1.0 mL of the *Sample solution* from the test for *Color of Solution* with water to 20 mL, and add 1 mL of nitric acid and 1 mL of silver nitrate TS. Mix, and allow to stand for 5 min, protected from direct sunlight.
Standard solution: Dilute 0.71 mL of 0.020 N hydrochloric acid to 100 mL. Mix 10 mL of this solution with water to 20 mL, and add 1 mL of nitric acid and 1 mL of silver nitrate TS. Mix, and allow to stand for 5 min, protected from direct sunlight.
Analysis
 (See *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*.)
 Compare the turbidity of the *Sample solution* and *Standard solution*, if any.
Acceptance criteria: 0.5%. Any turbidity produced by the *Sample solution* does not exceed that of the *Standard solution*.
- **HEAVY METALS**, *Method II* (231): NMT 20 µg/g

SPECIFIC TESTS

- **pH** (791)
Sample solution: Use the *Sample solution* from the test for *Color of Solution*.
Acceptance criteria: 5.5–8.0
- **LOSS ON DRYING** (731)
Sample: 1.0 g
Analysis: Dry the *Sample* at 105° to constant weight.
Acceptance criteria: NMT 10.0%
- **ROTATIONAL RHEOMETER METHODS** (912)
Sample: An amount equivalent to 6.0 g of dried Hymetellose
Analysis: While stirring, add the *Sample* to 150 g of carbon dioxide-free water heated to 90°. Stir with a propeller-type stirrer for 10 min, place the flask in a bath of ice water, continue the stirring, and allow to remain in the bath of ice water for 40 min to ensure that dissolution is complete. Adjust the mass of the solution to

300 g, and centrifuge the solution to expel any entrapped air. Adjust the temperature of the solution to $20 \pm 0.1^\circ$, and determine the viscosity using a rotational viscometer with a shear rate of 10/s.

Acceptance criteria: The apparent viscosity is 75%–140% of the value stated on the label.

• **COLOR OF SOLUTION**

Diluent: 27.5 mL of hydrochloric acid in 1000 mL of water

Standard solution: Prepare immediately before use. Mix 2.4 mL of ferric chloride CS and 0.6 mL of cobaltous chloride CS with *Diluent* to make 10 mL, and dilute 5 mL of this solution with *Diluent* to make 100 mL.

Sample solution: While stirring, add a portion equivalent to 1.0 g of dried Hymetellose to 50 g of carbon dioxide-free water heated to 90° . Allow to cool, adjust the weight of the solution to 100 g with carbon dioxide-free water, and stir until dissolution is complete.

Analysis: Make the comparison by viewing the substance and the solution downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* <631>).

Acceptance criteria: The *Sample solution* is not more intensely colored than the *Standard solution*.

• **CLARITY OF SOLUTION**

Hydrazine sulfate solution: 10 mg/mL of hydrazine sulfate. Allow to stand for 4–6 h before use.

[**CAUTION**—Hydrazine sulfate is highly toxic. Avoid skin contact.]

Methenamine solution: Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent mixture: To the flask containing *Methenamine solution* add 25.0 mL of *Hydrazine sulfate solution*, mix, and allow to stand for 24 h. This suspension is stable for 2 months. Mix before use, and do not use if it adheres to the container.

Opalescence standard: Dilute 15.0 mL of *Primary opalescent mixture* with water to 1000.0 mL. Use this suspension within 24 h after preparation.

Reference suspension: Transfer 30.0 mL of *Opalescence standard* to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: Use the solution from the test for *Color of Solution*.

Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer a portion of the *Reference suspension* to a separate matching test tube. Compare the *Sample solution* and the *Reference suspension* in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering* <851>, *Visual Comparison*) 5 min after preparation of the *Reference suspension*.

Acceptance criteria: The *Sample solution* is not more opalescent than the *Reference suspension*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements are specified.
- **LABELING:** Label it to indicate the viscosity of the solution (1 in 50) at 20° .

Hypophosphorous Acid

H₃PO₂ 66.00
Phosphinic acid;
Hypophosphorous acid [6303-21-5].

DEFINITION

Hypophosphorous Acid contains NLT 30.0% and NMT 32.0% of H₃PO₂.

IDENTIFICATION

- **A.** Hypophosphorous Acid yields a white precipitate with mercuric chloride TS. This precipitate becomes gray when an excess of hypophosphite is present.
- **B.** Hypophosphorous Acid acidified with sulfuric acid and warmed with cupric sulfate TS yields a red precipitate.

ASSAY

• **PROCEDURE**

Sample solution: Pour 7 mL of Hypophosphorous Acid into a tared, glass-stoppered flask, and weigh. Dilute with about 25 mL of water, and add phenolphthalein TS.

Analysis: Titrate with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 66.00 mg of H₃PO₂.

Acceptance criteria: 30.0%–32.0%

IMPURITIES

Inorganic Impurities

• **HEAVY METALS, Method II** <231>

Analysis: Place 0.90 mL (1 g) of Hypophosphorous Acid in a small beaker, and add 3 mL of water. Add 1 mL of nitric acid, and evaporate on a steam bath to about 1 mL. Again add 1 mL of nitric acid, and evaporate on a steam bath. Dissolve the residue in 3 mL of water, add 6 N ammonium hydroxide until the solution is distinctly alkaline to litmus, then boil gently until the odor of ammonia disappears. Add 2 mL of 1 N acetic acid and 15 mL of warm water, filter, and dilute the filtrate with water to 25 mL.

Acceptance criteria: NMT 20 ppm

SPECIFIC TESTS

• **LIMIT OF BARIUM AND OXALATE**

Sample solution: Hypophosphorous Acid and water (1:3)

Analysis 1: Neutralize 30 mL of the *Sample solution* with 6 N ammonium hydroxide: the mixture exhibits little or no precipitation. Filter, acidify 10 mL of the filtrate with hydrochloric acid, and add 2 mL of potassium sulfate TS.

Acceptance criteria 1: No turbidity is produced (barium).

Analysis 2: To a 10-mL portion of the filtrate obtained in *Analysis 1*, add 1 mL of calcium chloride TS.

Acceptance criteria 2: The filtrate shows no turbidity upon the addition of the calcium chloride TS (oxalate).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Hypromellose Acetate Succinate

Hydroxypropyl methylcellulose acetate succinate;
Cellulose, 2-hydroxypropyl methyl ether, acetate hydrogen butanedioate;
Cellulose, 2-hydroxypropyl methyl ether, acetate succinate [71138-97-1].

DEFINITION

Hypromellose Acetate Succinate is a mixture of acetic acid and monosuccinic acid esters of hydroxypropyl methylcellulose. It contains NLT 12.0% and NMT 28.0% of methoxy groups (–OCH₃), NLT 4.0% and NMT 23.0% of hydroxypropoxy groups (–OCH₂CHOHCH₃), NLT 2.0% and NMT 16.0% of acetyl groups (–COCH₃), and NLT 4.0% and NMT 28.0% of succinoyl groups (–COC₂H₄COOH), calculated on the dried basis.

IDENTIFICATION**A. INFRARED ABSORPTION** (197A)

Sample: Neat. Do not dry specimen.

Analysis: Use a Fourier transform IR spectrophotometer fitted with a suitable accessory for single bounce attenuated total reflectance (see *Spectrophotometry and Light-Scattering* (851)) with a diamond or germanium crystal. Acquire a background single-beam spectrum with a clean diamond or germanium crystal sampling plate in place. Place the sample on the diamond or germanium crystal sampling surface with a microspatula or equivalent. For best results, the sample should cover the crystal surface under the pressure point tip. Using the pressure device, apply pressure to the sample, making sure the sample remains centered under the pressure tip. Acquire a single-beam spectrum of the sample, and make the necessary corrections for the background. Release the pressure device, and clear it from the sample area. Wipe the sample off the crystal and pressure device tip, and rinse both with acetone.

Acceptance criteria: The IR spectrum of the *Sample* exhibits maxima only at the same wavelengths as a similarly obtained spectrum of USP Hypromellose Acetate Succinate RS.

ASSAY**• ACETYL AND SUCCINOYL GROUPS**

Phosphoric acid solution: 1.25 M phosphoric acid and water (2:98)

Buffer: 2.72 g/L of monobasic potassium phosphate

Diluent: Adjust the *Buffer* with 1 N sodium hydroxide to a pH of 7.5.

Acetic acid stock solution: Add approximately 20 mL of water to a stoppered, 100-mL volumetric flask, place the flask on a balance, and tare. Transfer 2.0 mL of glacial acetic acid to the flask, and record the weight of the acid added. Fill the flask with water to volume. Transfer 6 mL of the resulting solution into a 100-mL volumetric flask, and dilute with water to volume.

Succinic acid stock solution: 1.3 mg/mL of succinic acid

Mobile phase: Adjust the *Buffer* to a pH of 2.8 by the dropwise addition of 6 M phosphoric acid. Pass through a 0.22- μ m nylon filter.

Standard solution 1: Transfer 4.0 mL of the *Acetic acid stock solution* and 4.0 mL of the *Succinic acid stock solution* to a 25-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

Standard solution 2: Prepare as directed for *Standard solution 1*. This solution is prepared as a duplicate.

Sample solution: Weigh 12.4 mg of Hypromellose Acetate Succinate into a glass vial. Transfer 4.0 mL of 1.0 N sodium hydroxide to the vial, and stir the solution for 4 h. Then, add 4.0 mL of 1.25 M phosphoric acid to the same vial to bring the pH of the solution to 3 or less. Invert the test *Sample solution* vial several times to ensure complete mixing, and pass through a filter of 0.22- μ m pore size. Use the clear filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: 20°–30°

Flow rate: 1 mL/min

Run time: 15 min

Injection volume: 10 μ L

System suitability

Samples: *Standard solution 1* and *Standard solution 2*

Suitability requirements

Column efficiency: NLT 8000 theoretical plates, determined from the succinic acid peak, *Standard solution 1*

Tailing factor: 0.9–1.5 for the succinic acid peak, *Standard solution 1*

Relative standard deviation: NMT 2.0% for each peak from six replicate injections, *Standard solution 1*

Peak difference: The difference in peak areas between *Standard solution 1* and *Standard solution 2* for both acetic and succinic acids peaks does not exceed 2%.

[NOTE—After each run sequence, the column should be flushed first by 50% water and 50% acetonitrile for 60 min and then by 100% methanol for 60 min. The column should be stored in 100% methanol.]

Analysis

Samples: *Standard solution 1* and *Sample solution*
Calculate the percentage of acetic acid, *A*, in the portion of Hypromellose Acetate Succinate taken:

$$A = (r_{UA}/r_{SA}) \times (C_A/C_U) \times 100$$

r_{UA} = peak response for acetic acid from the *Sample solution*

r_{SA} = peak response for acetic acid from *Standard solution 1*

C_A = concentration of acetic acid in *Standard solution 1* (mg/mL)

C_U = concentration of Hypromellose Acetate Succinate in the *Sample solution* (mg/mL)

Calculate the percentage of acetyl groups ($-\text{COCH}_3$) in the portion of Hypromellose Acetate Succinate taken:

$$\text{Result} = (A - A_{\text{free}}) \times (M_{r1}/M_{r2})$$

A = defined above

A_{free} = percentage of free acetic acid, as determined in the test for *Limit of Free Acetic and Succinic Acids*

M_{r1} = molecular weight of the acetyl group, 43.04

M_{r2} = molecular weight of acetic acid, 60.05

Calculate the percentage of succinic acid, *S*, in the portion of Hypromellose Acetate Succinate taken:

$$S = (r_{US}/r_{SS}) \times (C_S/C_U) \times 100$$

r_{US} = peak response for succinic acid from the *Sample solution*

r_{SS} = peak response for succinic acid from *Standard solution 1*

C_S = concentration of succinic acid in *Standard solution 1* (mg/mL)

C_U = concentration of Hypromellose Acetate Succinate in the *Sample solution* (mg/mL)

Calculate the percentage of succinoyl groups ($-\text{COC}_2\text{H}_4\text{COOH}$) in the portion of Hypromellose Acetate Succinate taken:

$$\text{Result} = (S - S_{\text{free}}) \times (M_{r1}/M_{r2})$$

S = defined above

S_{free} = percentage of free succinic acid, as determined in the test for *Limit of Free Acetic and Succinic Acids*

M_{r1} = molecular weight of the succinoyl group, 101.08

M_{r2} = molecular weight of succinic acid, 118.09

Acceptance criteria

Acetyl groups ($-\text{COCH}_3$): 2.0%–16.0% on the dried basis

Succinoyl groups ($-\text{COC}_2\text{H}_4\text{COOH}$): 4.0%–28.0% on the dried basis

• CONTENT OF METHOXY AND 2-HYDROXYPROPOXY GROUPS

[CAUTION—Hydriodic acid and its reaction byproducts are highly toxic. Perform all steps in the preparation of the *Sample solution* and the *Standard solution* in a properly functioning hood. Specific safety practices to be followed are to be identified to the analyst performing this test.]

Hydriodic acid: Use a reagent having a specific gravity of at least 1.69, equivalent to 55% hydrogen iodide.

Solution A: Methanol and water (10:90)

Solution B: Methanol and water (85:15)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	70	30
8	40	60
10	15	85
17	15	85

[NOTE—These gradient elution times are established on an HPLC system with a dwell volume of approximately 2.0 mL. The injection time can be adjusted relative to the start of a run to accommodate the change in dwell volume from one HPLC system to another to achieve the separation described.]

Standard stock solution: Transfer 2 mL of *o*-xylene into a stoppered, 10-mL volumetric flask, place the flask on a balance, and tare. Add 200 µL of methyl iodide, insert the stopper into the flask, and accurately weigh: the weight of methyl iodide is about 350 mg. Tare the flask again, add 34 µL of isopropyl iodide, and weigh the flask: the recorded weight of isopropyl iodide is 50 mg. Dilute with *o*-xylene to volume, and mix.

Standard solution: Transfer 85 mg of adipic acid into an 8-mL vial (or other suitable container), add 2 mL of *Hydriodic acid*, and add 2.0 mL of the *Standard stock solution*. Shake and allow the phases to separate. Carefully transfer approximately 1.5 mL of the *o*-xylene (top) layer to a small vial, making sure that the bottom aqueous layer is not disturbed. Transfer 1.0 mL of the resulting solution to a 10-mL volumetric flask, and dilute with methanol to volume. [NOTE—This solution is stable for 8 h at 5°.]

Sample solution: [CAUTION—Use a cap that has a top safety relief valve, such as a Minniert valve, to prevent accidental explosion of the vial under high pressure when heated.] Weigh 65 mg of Hypromellose Acetate Succinate into a 5-mL reaction vial, and add 2.0 mL of *o*-xylene and about 100 mg of adipic acid. Add 2.0 mL of *Hydriodic acid*, and close the vial tightly with a cap. Weigh the vial before heating, and place the vial into a heating block at 150°. Shake the vial after 5 min and after 30 min of heating. Remove the vial from the heating block after 1 h of heating, and cool. Weigh the vial. If the weight loss is greater than 10 mg, discard the mixture, and prepare another reaction solution. Carefully transfer approximately 1.5 mL of the top *o*-xylene layer into a small glass vial, making sure that the bottom aqueous layer is not disturbed. Transfer 1.0 mL of this solution into a 10-mL volumetric flask, and dilute with methanol to volume. [NOTE—This solution is stable for 8 h at 5°.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 10,000 theoretical plates, determined from the methyl iodide peak

Tailing factor: 0.9–1.5 for the methyl iodide peak

Relative standard deviation: NMT 2.0% for each peak

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of methoxy groups (–OCH₃) in the portion of Hypromellose Acetate Succinate taken:

$$\text{Result} = (r_{UM}/r_{SM}) \times (C_S/C_U) \times (M_{r1}/M_{r2})$$

r_{UM} = peak response for methyl iodide from the *Sample solution*

r_{SM} = peak response for methyl iodide from the *Standard solution*

C_S = concentration of methyl iodide in the *Standard solution* (mg/mL)

C_U = concentration of Hypromellose Acetate Succinate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of the methoxy group, 31.03

M_{r2} = molecular weight of methyl iodide, 141.94
Calculate the percentage of 2-hydroxypropoxy groups (–OCH₂CHOHCH₃) in the portion of Hypromellose Acetate Succinate taken:

$$\text{Result} = (r_{UI}/r_{SI}) \times (C_S/C_U) \times (M_{r1}/M_{r2})$$

r_{UI} = peak response for isopropyl iodide from the *Sample solution*

r_{SI} = peak response for isopropyl iodide from the *Standard solution*

C_S = concentration of isopropyl iodide in the *Standard solution* (mg/mL)

C_U = concentration of Hypromellose Acetate Succinate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of the 2-hydroxypropoxy group, 75.09

M_{r2} = molecular weight of isopropyl iodide, 169.99

Acceptance criteria

Methoxy groups (–OCH₃): 12.0%–28.0% on the dried basis

Hydroxypropoxy groups (–OCH₂CHOHCH₃): 4.0%–23.0% on the dried basis

IMPURITIES

• RESIDUE ON IGNITION <281>

Analysis: Determine at 600 ± 50°.

Acceptance criteria: NMT 0.20%

• HEAVY METALS, Method II <231>: NMT 10 µg/g

• LIMIT OF FREE ACETIC AND SUCCINIC ACIDS

Phosphoric acid solution, Buffer, Diluent, Acetic acid stock solution, Succinic acid stock solution, Mobile phase, Standard solution, and Chromatographic system: Proceed as directed in the *Assay for Acetyl and Succinoyl Groups*.

Sample solution: Weigh 102 mg of Hypromellose Acetate Succinate into a glass vial. Transfer 4.0 mL of *Diluent* to the vial, and stir the content for 2 h. Then, transfer 4.0 mL of the *Phosphoric acid solution* to the same vial to bring the pH of the *Sample solution* to 3 or less. Invert the vial several times to ensure complete mixing, centrifuge, and use the clear supernatant.

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of free acetic acid, A_{free} , in the portion of Hypromellose Acetate Succinate taken:

$$A_{free} = (r_{UA}/r_{SA}) \times (C_A/C_U) \times 100$$

r_{UA} = peak response for acetic acid from the *Sample solution*

r_{SA} = peak response for acetic acid from the *Standard solution*

C_A = concentration of acetic acid in the *Standard solution* (mg/mL)

C_U = concentration of Hypromellose Acetate Succinate in the *Sample solution* (mg/mL)

Calculate the percentage of free succinic acid, S_{free} , in the portion of Hypromellose Acetate Succinate taken:

$$S_{free} = (r_{US}/r_{SS}) \times (C_S/C_U) \times 100$$

r_{US} = peak response for succinic acid from the *Sample solution*

r_{SS} = peak response for succinic acid from the *Standard solution*

C_S = concentration of succinic acid in the *Standard solution* (mg/mL)

C_U = concentration of Hypromellose Acetate Succinate in the *Sample solution* (mg/mL)

Acceptance criteria: The sum of free acetic acid and free succinic acid is NMT 1.0%.

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry at 105° for 1 h.

Acceptance criteria: NMT 5.0%

• VISCOSITY—CAPILLARY VISCOMETER METHODS (911)

Sodium hydroxide solution: Immediately before use, prepare 4.3 mg/mL of sodium hydroxide in carbon dioxide-free water.

Analysis: To 2.00 g of Hypromellose Acetate Succinate, previously dried, add *Sodium hydroxide solution* to make 100.0 g, insert a stopper into the vessel, and dissolve by constant shaking for 30 min. Adjust the temperature of the solution to $20 \pm 0.1^\circ$, and determine the viscosity in a suitable viscometer.

Acceptance criteria: 80%–120% of that stated on the label

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.
- **LABELING:** Label it to indicate its nominal viscosity type.
- **USP REFERENCE STANDARDS (11)**
USP Hypromellose Acetate Succinate RS

Hypromellose Phthalate

DEFINITION

Hypromellose Phthalate is a monophthalic acid ester of hydroxypropyl methylcellulose. It contains methoxy ($-\text{OCH}_3$), hydroxypropoxy ($-\text{OCH}_2\text{CHOHCH}_3$), and phthalyl (*o*-carboxybenzoyl, $\text{C}_8\text{H}_5\text{O}_3$) groups. It contains NLT 21.0% and NMT 35.0% of phthalyl groups, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K):** Do not dry specimens.

ASSAY

• PHTHALYL CONTENT

Sample: 1 g

Analysis: Transfer the *Sample* to a conical flask, dissolve in 50 mL of a mixture of alcohol, acetone, and water (2:2:1), add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination (see *Titrimetry* (541)).

Calculate the percentage of phthalyl taken:

$$\text{Result} = [0.01 \times M_{r1} \times (V/W)] - [2 \times (M_{r1}/M_{r2}) \times P]$$

M_{r1} = molecular weight of the phthalyl group, 149.1

V = volume of 0.1 N sodium hydroxide consumed after correction for the blank (mL)

W = weight of Hypromellose Phthalate taken, calculated on the anhydrous basis (g)

M_{r2} = molecular weight of phthalic acid, 166.1

P = percentage of free phthalic acid found as directed in the test for *Limit of Free Phthalic Acid*

Acceptance criteria: 21.0%–35.0% of phthalyl groups on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.20%

- **CHLORIDE AND SULFATE, Chloride (221)**

Sample solution: Dissolve 1.0 g in 40 mL of 0.2 N sodium hydroxide, add 1 drop of phenolphthalein TS, and add 2 N nitric acid dropwise, with stirring, until the red color is discharged. Add an additional 20 mL of 2 N nitric acid with stirring. Heat on a water bath, with stirring, until the gel-like precipitate formed becomes granular. Cool the mixture, and centrifuge. Separate the liquid phase, and wash the residue with three successive 20-mL portions of water, separating the washings by centrifuging. Dilute the combined liquids with water to 200 mL, mix, and filter.

Standard solution: Treat 0.50 mL of 0.01 N hydrochloric acid with 10 mL of 0.2 N sodium hydroxide, add 7 mL of 2 N nitric acid, and dilute with water to 50 mL.

Acceptance criteria: A 50-mL portion of the *Sample solution* shows no more chloride than the *Standard solution* (0.07%).

- **HEAVY METALS, Method II (231):** NMT 10 µg/g

- **LIMIT OF FREE PHTHALIC ACID**

Mobile phase: Acetonitrile and 0.1 M cyanoacetic acid (15:85)

Standard solution: Transfer 12.5 mg of phthalic acid to a 250-mL volumetric flask, and add 125 mL of acetonitrile. Add 25 mL of water, and dilute with acetonitrile to volume.

Sample solution: Transfer 200 mg of Hypromellose Phthalate to a 100-mL volumetric flask. Add 50 mL of acetonitrile, and sonicate to dissolve partially. Add 10 mL of water, and sonicate to dissolve. Cool to room temperature, and dilute with acetonitrile to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 25-cm; packing L1 with a high carbon load

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 1.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of phthalic acid in the portion of Hypromellose Phthalate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of phthalic acid from the *Sample solution*

r_S = peak response of phthalic acid from the *Standard solution*

C_S = concentration of phthalic acid in the *Standard solution* (mg/mL)

C_U = concentration of Hypromellose Phthalate in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 1.0%

SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** NMT 5.0%
- **VISCOSITY—CAPILLARY VISCOMETER METHODS (911)**
Sample solution: Dissolve 10 g, previously dried at 105° for 1 h, in 90 g of a mixture of methanol and methylene chloride (1:1 w/w) by mixing and shaking.
Analysis: Determine the viscosity at 20 ± 0.1°.
Acceptance criteria: 80%–120% of that indicated by the label

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate its viscosity and nominal phthalyl content.
- **USP REFERENCE STANDARDS (11)**
 USP Hypromellose Phthalate RS

Imidurea

$C_{11}H_{16}N_8O_8$ 388.29
N,N'-Methylenebis[*N'*-[3-(hydroxymethyl)-2,5-dioxo-4-imidazolidinyl]urea];
 1,1'-Methylenebis[3-[3-(hydroxymethyl)-2,5-dioxo-4-imidazolidinyl]urea] [39236-46-9].

DEFINITION

Imidurea contains NLT 26.0% and NMT 28.0% of nitrogen (N), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

OTHER COMPONENTS

• NITROGEN CONTENT

Sample: 150 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N hydrochloric acid VS

Endpoint detection: Visual

Analysis: Place the *Sample* in a 500-mL Kjeldahl flask, and add 8.0 g of anhydrous sodium sulfate, 0.5 g of anhydrous cupric sulfate, 0.1 g of yellow mercuric oxide, and 11 mL of sulfuric acid. Incline the flask at an angle of 45°, and gently heat the mixture, keeping the temperature below the boiling point until frothing has ceased. Increase the heat until the acid boils briskly, and continue the heating until the solution has become clear green in color or practically colorless for 30 min. Allow to cool, cautiously add 225 mL of water, mix the contents of the flask, and again cool. Add cautiously 1.0 g of zinc metal dust, 2.0 g of sodium thiosulfate, and 18.0 g of sodium hydroxide pellets, and without delay connect the flask to a Kjeldahl connecting bulb (trap), previously attached to a condenser, the delivery tube of which dips beneath the surface of 50 mL of boric acid solution (40 mg/mL) in a 300-mL conical flask. Mix the contents of the Kjeldahl flask by gentle rotation, and distill 125 mL into the receiver. Add NLT 3 drops of methyl red–methylene blue TS to the contents of the receiving vessel, and determine the ammonia by titration with *Titrant*. Perform a blank determination, and make any necessary correction.

Calculate the percentage of nitrogen in the portion of Imidurea taken. Each mL of 0.1 N hydrochloric acid is equivalent to 1.401 mg of nitrogen.

Acceptance criteria: 26.0%–28.0% of nitrogen (N) on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 3.0%
- **HEAVY METALS, Method II (231):** NMT 10 µg/g

SPECIFIC TESTS

- **PH (791)**
Sample solution: 10 mg/mL
Acceptance criteria: 6.0–7.5
- **LOSS ON DRYING (731)**
Analysis: Dry under vacuum over phosphorus pentoxide for 48 h.
Acceptance criteria: NMT 3.0%
- **COLOR AND CLARITY OF SOLUTION**
Sample: 3.0 g
Analysis: Dissolve the *Sample* in 7.0 mL of water in a test tube.
Acceptance criteria: The solution is clear and colorless.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
 USP Imidurea RS

Inositol

$C_6H_{12}O_6$ 180.16
cis-1,2,3,5-*trans*-4,6-Cyclohexanehexol;
myo-Inositol [87-89-8].

DEFINITION

Inositol contains NLT 97.0% and NMT 102.0% of Inositol ($C_6H_{12}O_6$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Mobile phase: Water

System suitability solution: 0.05 mg/mL of USP Inositol RS and 0.05 mg/mL of USP Mannitol RS

Standard solution: 50 mg/mL of USP Inositol RS

Sample solution: 50 mg/mL of Inositol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm × 30-cm or equivalent; packing L19

Temperature

Column: 85°

Detector: Constant temperature of 30°–35°

Flow rate: 0.5 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for inositol and mannitol are 1.0 and 1.3, respectively.]

Suitability requirements

Resolution: NLT 4.0 between inositol and mannitol, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Record the chromatograms over a period of two times the retention time of inositol, and measure the peak responses.]

Calculate the percentage of Inositol ($C_6H_{12}O_6$) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of inositol from the *Sample solution*

r_S = peak response of inositol from the *Standard solution*

C_S = concentration of USP Inositol RS in the *Standard solution* (mg/mL)

C_U = concentration of Inositol in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the anhydrous basis

IMPURITIES• **BARIUM**

Sample solution: Use the *Sample solution* prepared in the test for *Clarity of Solution*. To 10 mL of the *Sample solution* add 1 mL of diluted sulfuric acid.

Acceptance criteria: When examined immediately and after 1 h, any opalescence in the solution is not more intense than that in a mixture of 1 mL of water and 10 mL of the *Sample solution* from the test for *Clarity of Solution*.

• **LIMIT OF LEAD**

Lead nitrate stock solution: Dissolve 159.8 mg of lead nitrate in 100 mL of water to which has been added 1 mL of nitric acid, then dilute with water to 1000 mL. Prepare and store this solution in glass containers free from soluble lead salts.

Standard lead solution: On the day of use, dilute 10.0 mL of the *Lead nitrate stock solution* with water to 100.0 mL. Each mL of the *Standard lead solution* contains the equivalent of 10 µg of lead. A comparison solution prepared on the basis of 100 µL of the *Standard lead solution* per g of substance being tested contains the equivalent of 1 part of lead per million parts of substance being tested.

Sample solution: Dissolve 20.0 g of Inositol in diluted acetic acid, and dilute with diluted acetic acid to 100 mL. Add 2.0 mL of a saturated ammonium pyrrolidinedithiocarbamate solution (containing about 10 g of ammonium pyrrolidinedithiocarbamate per L) and 10.0 mL of methyl isobutyl ketone, and shake for 30 s. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Blank solution: Prepare as directed for the *Sample solution*, except omit the use of Inositol.

Standard solutions: Prepare as directed for the *Sample solution*, except prepare three *Standard solutions* by adding 0.5, 1.0, and 1.5 mL, respectively, of the *Standard lead solution* in addition to the 20.0 g of Inositol to be examined.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption

Analytical wavelength: 283.3 nm

Lamp: Lead hollow-cathode

Flame: Air–acetylene

Analysis: Set the atomic absorption spectrometer to zero, using the *Blank solution*. Introduce the *Sample solution* and each of the three *Standard solutions* into the instrument, and record the steady absorbance

reading. Plot the absorbance readings against the known concentrations of added lead (in µg), and draw a straight line. Extrapolate the line until it meets the concentration axis to obtain the concentration, in mg/kg, of lead in the sample.

Acceptance criteria: NMT 0.5 mg/kg

• **ORGANIC IMPURITIES**

Mobile phase, System suitability solution, and Sample solution: Proceed as directed in the *Assay*.

Standard solution: Transfer 2.0 mL of the *Standard solution*, prepared as directed in the *Assay*, to a 100-mL volumetric flask, and dilute with water to volume.

[NOTE—This solution contains 1 mg/mL of inositol.]

Chromatographic system: Proceed as directed in the *Assay*, except use an injection volume of 20 µL.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Inositol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any impurity from the *Sample solution*

r_S = peak response of inositol from the *Standard solution*

C_S = concentration of USP Inositol RS in the *Standard solution* (mg/mL)

C_U = concentration of Inositol in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurities: NMT 0.3%

Total impurities: NMT 1.0%. [NOTE—Disregard any impurity peak that is less than 0.05%.]

SPECIFIC TESTS• **CLARITY OF SOLUTION**

[NOTE—The *Sample solution* is to be compared to *Reference suspension A* in diffused daylight 5 min after preparation of *Reference suspension A*.]

Solution A: 10 mg/mL of hydrazine sulfate. Allow to stand for 4–6 h before use.

Solution B: 100 mg/mL of methenamine prepared in a glass-stoppered flask.

Primary opalescent suspension: [NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.] *Solution A* and *Solution B* (1:1). Allow to stand for 24 h.

Opalescence standard: Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, dilute with water to volume. [NOTE—This suspension should not be used beyond 24 h after preparation.]

Reference suspensions

Reference suspension A: Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, and dilute with water to volume.

Reference suspension B: Transfer 10.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: 100 mg/mL of Inositol

Analysis: Transfer a sufficient portion of the *Sample solution* to a sample tube of colorless, transparent, neutral glass, with a flat base and an internal diameter of 15–25 mm, to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A*, *Reference suspension B*, and water to separate matching sample tubes. Compare the *Sample solution*, *Reference suspension A*, *Reference suspension B*, and water in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering* <851>, *Visual Comparison*). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and that *Reference suspension*

B can readily be distinguished from *Reference suspension A*.]

Acceptance criteria: The *Sample solution* shows the same clarity as that of water.

• **COLOR OF SOLUTION**

Standard stock solutions: Prepare three solutions, *A*, *B*, and *C*, containing, respectively, the following parts of ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and diluted hydrochloric acid.

Standard stock solution A: 2.4: 0.6: 0: 7.0

Standard stock solution B: 2.4: 1.0: 0.4: 6.2

Standard stock solution C: 9.6: 0.2: 0.2: 0

Standard solutions: [NOTE—Prepare the *Standard solutions* immediately before use.]

Standard solution A: Transfer 2.5 mL of *Standard stock solution A* to a 100-mL volumetric flask, dilute with diluted hydrochloric acid to volume, and mix.

Standard solution B: Transfer 2.5 mL of *Standard stock solution B* to a 100-mL volumetric flask, dilute with diluted hydrochloric acid to volume, and mix.

Standard solution C: Transfer 0.75 mL of *Standard stock solution C* to a 100-mL volumetric flask, dilute with diluted hydrochloric acid to volume, and mix.

Sample solution: Use the *Sample solution* prepared in *Clarity of Solution*.

Analysis: Transfer a sufficient portion of the *Sample solution* to a sample tube of colorless, transparent, neutral glass, with a flat base and an internal diameter of 15–25 mm, to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution A*, *Standard solution B*, *Standard solution C*, and water to separate matching sample tubes. Compare the *Sample solution*, *Standard solution A*, *Standard solution B*, *Standard solution C*, and water in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* <851>, *Visual Comparison*).

Acceptance criteria: The *Sample solution* is not more intensely colored than *Standard solution A*, *Standard solution B*, *Standard solution C*, or water.

• **CONDUCTIVITY**

Sample solution: Transfer 10.0 g of Inositol, weighed and calculated on the dried basis, to a 50-mL volumetric flask, and dissolve in and dilute with water (previously boiled and cooled to room temperature) to volume.

Apparatus: Use a conductivity meter or a resistivity meter that measures the resistance of the column of liquid between the electrodes of the immersed measuring device. The apparatus is supplied with alternating current to avoid the effects of electrode polarization. It is equipped with a temperature compensation device or a precision thermometer.

Reagents: Prepare three *Standard solutions* of potassium chloride containing 0.7455, 0.0746, and 0.0149 g, respectively, of potassium chloride per 1000.0 g of solution. These solutions should be prepared with water that has been previously boiled and cooled to room temperature and whose conductivity does not exceed 2 µS/cm. The conductivity and resistivity of these three solutions at 20° are provided in *Table 1*.

Table 1

Concentration of Solution (g/1000.0 g)	Conductivity (µS/cm)	Resistivity (Ω-cm)
0.7455	1330	752
0.0746	133.0	7519
0.0149	26.6	37,594

Calibration: Choose a conductivity cell that is appropriate for the conductivity of the solution to be examined. The higher the expected conductivity, the higher the cell constant that must be chosen.

Commonly used conductivity cells have cell constants of the order 0.1, 1, and 10 cm⁻¹. Use a standard solution of potassium chloride that is appropriate for the measurement. The conductivity value of the standard solution of potassium chloride should be near the expected conductivity value of the *Sample solution*. Rinse the cell several times with water that has been previously boiled and cooled to room temperature, and rinse at least twice with the potassium chloride solution used for the determination of the cell constant of the conductivity cell. Measure the resistance of the conductivity cell, using the potassium chloride solution at 20 ± 0.1°.

Calculate the constant, in cm⁻¹, of the conductivity cell:

$$\text{Result} = R_{KCl} \times K_{KCl}$$

R_{KCl} = measured resistance, expressed in mega-ohms

K_{KCl} = conductivity of the standard solution of potassium chloride used, expressed in µS/cm. The measured constant of the conductivity cell must be within 5% of the given value.

Analysis: Rinse the conductivity cell several times with water that has been previously boiled and cooled to room temperature, and rinse at least twice with the *Sample solution*. Measure the conductivity of the *Sample solution*, while gently stirring with a magnetic stirrer.

Acceptance criteria: NMT 20 µS/cm

- **WATER DETERMINATION, Method I** <921>: NMT 0.5% determined on a 1.0-g sample

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.
- **USP REFERENCE STANDARDS** <11>
USP Inositol RS
USP Mannitol RS

Isobutane

C₄H₁₀

58.12

DEFINITION

Isobutane contains NLT 95.0% of isobutane (C₄H₁₀).

[**CAUTION**—Isobutane is highly flammable and explosive.]

IDENTIFICATION

- **A. IR ABSORPTION:** Exhibits maxima, among others, at about the following wavelengths (µm): 3.4 (vs), 6.8 (s), 7.2 (m), 8.5 (m), and 10.9 (m)
- **B.** The vapor pressure of a test specimen obtained as directed for *Propellants* (in *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* <601>, *General Sampling Procedures*), and determined at 21° by means of a suitable pressure gauge, is between 303 and 331 kPa absolute (44 and 48 psia).

ASSAY

• **PROCEDURE**

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Thermal conductivity

Column: 3-mm × 6-m aluminum; packed with 10 weight percent of liquid phase G30 on non-acid-washed support S1C

Column temperature: 33°

Carrier gas: Helium

Flow rate: 50 mL/min

Injection volume: 2 µL

System suitability

Sample: Isobutane

Suitability requirements

Sample response comparison: Peak responses for Isobutane from duplicate injections agree within 1%.

Analysis

Sample: Isobutane

Connect 1 Isobutane cylinder to the chromatograph through a suitable sampling valve and a flow control valve downstream from the sampling valve. Flush the liquid specimen through the sampling valve, taking care to avoid entrapment of gas or air in the sampling valve. Calculate the percentage purity of Isobutane:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of isobutane

r_T = sum of all the peak responses

Acceptance criteria: NLT 95.0%

SPECIFIC TESTS

• **WATER:** NMT 0.001%, determined as directed in *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601), *Water Content*

• **HIGH-BOILING RESIDUES:** NMT 5 µg/mL, determined as directed in *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601), *High-Boiling Residues, Method II*

• **ACIDITY OF RESIDUE**

Sample: Residue from the test for *High-Boiling Residues*

Analysis: Add 10 mL of water to the *Sample*, mix by swirling for about 30 s, add 2 drops of methyl orange TS, insert the stopper in the tube, and shake vigorously.

Acceptance criteria: No pink or red color appears in the aqueous layer.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight cylinders, and prevent exposure to excessive heat.

Isomalt

$C_{12}H_{24}O_{11}$ 344.31

6-O- α -D-Glucopyranosyl-D-sorbitol;
6-O- α -D-Glucopyranosyl-D-glucitol;

$C_{12}H_{24}O_{11} \cdot 2H_2O$ 380.32
1-O- α -D-Glucopyranosyl-D-mannitol dihydrate [64519-82-0].

DEFINITION

Isomalt contains NLT 98.0% and NMT 102.0% of a mixture of 6-O- α -D-glucopyranosyl-D-sorbitol (1,6-GPS) and 1-O- α -D-glucopyranosyl-D-mannitol (1,1-GPM), and neither of the two components is less than 3.0% of the mixture, calculated on the anhydrous basis.

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHY** (201)

Standard solution: 5 mg/mL of USP Isomalt RS

Sample solution: 5 mg/mL

Chromatographic system

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture containing a fluorescent indicator having optimal intensity at 254 nm

Application volume: 1 µL

Developing solvent system: Ethyl acetate, pyridine, water, acetic acid, and propionic acid (10:10:2:1:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Thoroughly dry the starting points in warm air. Develop over 10 cm using the *Developing solvent system*, dry the plate in a current of hot air, and dip for 3 s in a 1-mg/mL solution of sodium periodate. Dip the plate for 3 s in a mixture of dehydrated alcohol, sulfuric acid, acetic acid, and anisaldehyde (90:5:1:1). Dry the plate in a current of hot air until colored spots become visible. The background color may be brightened by exposure to warm steam. Examine in daylight.

Acceptance criteria: The principal spots of the *Sample solution* are similar in position and color to those of the *Standard solution*.

- **B.** The retention times of the two principal peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: Water

Standard solution: 20 mg/mL of USP Isomalt RS

Sample solution: 20 mg/mL of Isomalt

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Guard column: 4.6-mm \times 3-cm; packing L19

Column: 7.8-mm \times 30-cm; packing L19

Column temperature: 80 \pm 1°

Flow rate: 0.5 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for 1,1-GPM and 1,6-GPS are about 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 2.0 between 1,1-GPM and 1,6-GPS

Relative standard deviation: NMT 2.0% for the 1,6-GPS and 1,1-GPM peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of 1,6-GPS in the portion of Isomalt taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of 1,6-GPS from the *Sample solution*

r_S = peak response of 1,6-GPS from the *Standard solution*

C_S = concentration of 1,6-GPS in the *Standard solution*, with calculation based on the declared 1,6-GPS content of USP Isomalt RS (mg/mL)

C_U = concentration of Isomalt in the *Sample solution* (mg/mL)

Calculate the percentage of 1,1-GPM in the portion of Isomalt taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of 1,1-GPM from the *Sample solution*

r_S = peak response of 1,1-GPM from the *Standard solution*

C_S = concentration of 1,1-GPM in the *Standard solution*, with calculation based on the declared 1,1-GPM content of USP Isomalt RS (mg/mL)

C_U = concentration of Isomalt in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% of a mixture of 6-O- α -D-glucopyranosyl-D-sorbitol (1,6-GPS) and 1-O- α -

D-glucopyranosyl-D-mannitol (1,1-GPM), and neither of the two components is less than 3.0%, calculated on the anhydrous basis.

IMPURITIES

- **HEAVY METALS**, *Method I* (231): NMT 10 µg/g
- **LIMIT OF NICKEL**

[NOTE—The purity of the reagents and the water used must be suitable for trace analysis, and the reagents and water must be free of nickel.]

Nickel standard solution: Transfer 1 mL of nickel standard solution TS to a 100-mL volumetric flask, add 1 mL of nitric acid, and dilute with water to volume. This solution contains the equivalent of 0.1 µg/mL of nickel.

Standard solutions: Into seven identical 10-mL volumetric flasks, introduce respectively 0, 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 mL of *Nickel standard solution* equivalent to 0, 0.05, 0.1, 0.15, 0.2, 0.25, and 0.3 µg of nickel. To each flask add a 2.0-mL portion of the *Sample solution*, and dilute with water to volume.

Sample solution: Weigh 8 g of Isomalt into a 50-mL volumetric flask, add 8 mL of water and 3 mL of 65% nitric acid solution, and incubate at 95° for 1 h. Allow the solution to cool to room temperature, add another 3 mL of 65% nitric acid solution, and incubate at 95° until all brown vapors have dissipated (1–1.5 h). Allow the solution to cool to room temperature, carefully add 3 mL of 30% hydrogen peroxide, and keep the solution at 95° until the evolution of gas has ceased (1–2 h). Allow the solution to cool to room temperature. Repeat the procedure two more times, i.e., adding 30% hydrogen peroxide, heating to 95°, and cooling to room temperature. Dilute the resulting solution with water to 50 mL.

Blank: Prepare as directed for the *Sample solution*, except omit the addition of Isomalt.

Blank solutions: Prepare as directed for the *Standard solutions*, except replace 2 mL of the *Sample solution* with 2 mL of the *Blank*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry, using an instrument equipped with a graphite furnace

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Analysis: Concomitantly determine the absorbances of the *Standard solutions* and the *Blank solutions*. Record the average of the steady readings for each of the *Standard solutions* and the *Blank solutions*. Plot the absorbances of the *Standard solutions* versus the quantity of nickel, in µg, in the portion of *Nickel standard solution* added to each *Standard solution* flask. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the amount of nickel (A_T), in µg, in the portion of the *Sample solution* that was added to each of the *Standard solution* flasks. Similarly, plot the absorbances of the *Blank solutions* versus the quantity of nickel, in µg, in the portion of *Nickel standard solution* added to each of the *Blank solutions* flasks to determine the quantity of nickel (A_B) in the portion of *Blank* added to each of the *Blank solutions* flasks.

Calculate the quantity, in µg/g, of nickel in the portion of Isomalt taken:

$$\text{Result} = (A_T - A_B) \times (D/W)$$

A_T = amount of nickel in the portion of the *Sample solution* that was added to each of the *Standard solutions* flasks (µg)

A_B = quantity of nickel in the portion of *Blank* added to each of the *Blank solutions* flasks (µg)

D = volume of the *Sample solution* prepared per volume of the *Sample solution* used for analysis, 50/2

W = weight of Isomalt used to prepare the *Sample solution* (g)

Acceptance criteria: NMT 1 µg/g, calculated on the anhydrous basis

• ORGANIC IMPURITIES

Mobile phase, Chromatographic system, and Sample solution: Proceed as directed in the *Assay*.

Standard solution: 0.1 mg/mL each of USP Sorbitol RS and USP Mannitol RS

System suitability solution: 20 mg/mL of USP Isomalt RS and 0.1 mg/mL each of USP Mannitol RS and USP Sorbitol RS in water

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for 1,1-GPM, 1,6-GPS, mannitol, and sorbitol are about 1.0, 1.2, 1.6, and 2.0, respectively. The typical retention time for 1,1-GPM is about 12.3 min.]

Suitability requirements

Resolution: NLT 2.0 between 1,1-GPM and 1,6-GPS

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of mannitol or sorbitol in the portion of Isomalt taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of mannitol or sorbitol from the *Sample solution*

r_S = peak response of mannitol or sorbitol from the *Standard solution*

C_S = concentration of USP Mannitol RS or USP Sorbitol RS in the *Standard solution* (mg/mL)

C_U = concentration of Isomalt in the *Sample solution* (mg/mL)

Calculate the percentage of any unknown impurity in the portion of Isomalt taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each unknown impurity from the *Sample solution*

r_S = peak response of sorbitol from the *Standard solution*

C_S = concentration of USP Sorbitol RS in the *Standard solution* (mg/mL)

C_U = concentration of Isomalt in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*. [NOTE—Disregard any impurity peak that is less than 0.1%.]

Table 1

Name	Acceptance Criteria, NMT (%)
Mannitol	0.5
Sorbitol	0.5
Any unknown impurity	0.5
Total impurities	2.0

• REDUCING SUGARS

Sample solution: Dissolve 3.3 g in 10 mL of Purified Water with the aid of gentle heat. Cool, and add 20 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 min, and maintain boiling for 3 min. Cool rapidly, and add 40 mL of dilute acetic acid, 60 mL of water, and 20 mL of 0.025 M iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water.

Analysis: After the precipitate has dissolved, titrate the excess iodine with 0.05 N sodium thiosulfate VS, using

1 mL of starch TS, added toward the end of the titration as an indicator.

Acceptance criteria: NLT 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to NMT 0.3% of reducing sugars, determined on the anhydrous basis as glucose.

SPECIFIC TESTS

• WATER DETERMINATION, Method I (921)

Sample: 0.3 g

Analysis: Add the *Sample* to a mixture of anhydrous methanol and formamide (1:1) at $50 \pm 5^\circ$.

Acceptance criteria: NMT 7%

• CONDUCTIVITY

Sample solution: Dissolve 20 g in carbon dioxide-free water prepared from distilled water, and dilute with the same solvent to 100 mL.

Analysis: Using an appropriate conductivity meter that has been standardized with a potassium chloride conductivity calibration standard, measure the conductivity of the *Sample solution* while gently stirring with a magnetic stirrer.

Acceptance criteria: NMT 20 $\mu\text{S}/\text{cm}$

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements are specified.
- **LABELING:** Label it to indicate the percentage content of 1,6-GPS and 1,1-GPM.
- **USP REFERENCE STANDARDS (11)**
 - USP Isomalt RS
 - USP Mannitol RS
 - USP Sorbitol RS

Isopropyl Alcohol—see Isopropyl Alcohol General Monographs

Isopropyl Myristate

$\text{C}_{17}\text{H}_{34}\text{O}_2$ 270.45
Tetradecanoic acid, 1-methylethyl ester;
Isopropyl myristate [110-27-0].

DEFINITION

Isopropyl Myristate consists of esters of isopropyl alcohol and saturated high molecular weight fatty acids, principally myristic acid. It contains NLT 90.0% of isopropyl myristate ($\text{C}_{17}\text{H}_{34}\text{O}_2$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *System suitability solution*, as obtained in the *Assay*.

Alpha-Lactalbumin

$C_{626}H_{958}N_{162}O_{196}S_9$
[9051-29-0].

14178

DEFINITION

Alpha-Lactalbumin is a lyophilized or spray-dried powder of compact globular metalloprotein that may contain a single bound calcium ion and is capable of binding zinc and other metals. Alpha-Lactalbumin is isolated either from bovine milk or from whey, both of which should be from edible sources suitable for human use. All materials derived from bovine sources must originate from countries free of bovine spongiform encephalopathy. It contains alpha-lactalbumin at NLT 90.0% of the labeled total protein content. The remainder consists mostly of beta-lactoglobulin. It may contain suitable stabilizers.

IDENTIFICATION**A. SDS-POLYACRYLAMIDE GEL ELECTROPHORESIS**

Gel fixing solution: In a 1-L Pyrex bottle, thoroughly mix 500 mL of water, 400 mL of alcoholic TS, and 100 mL of glacial acetic acid.

Gel staining solution: Prepare a solution of Coomassie blue G-250 having a concentration of 0.25 g/L in a 10.0% (v/v) acetic acid solution.¹ Store at room temperature.

Destaining solution: 10.0% (v/v) acetic acid in water [NOTE—This solution may be stored at room temperature for up to 6 months from the date prepared.]

Sample buffer: Prepare a solution containing 200 mM tris(hydroxymethyl)aminomethane hydrochloride (Tris-HCl), 2% (w/v) sodium dodecyl sulfate (SDS), 40% (v/v) glycerol, and 0.04% (w/v) Coomassie blue G-250. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 6.8.²

Running buffer: Prepare a solution containing 100 mM tris(hydroxymethyl)aminomethane, 100 mM *N*-tris(hydroxymethyl)methylglycine (Tricine), and 0.1% (w/v) SDS in water. If necessary, adjust with hydrochloric acid or sodium hydroxide to a pH of 8.3.³ In a 400-mL beaker, thoroughly mix 35 mL of the solution so obtained (or 10 \times Tris/Tricine/SDS buffer)⁴ with 315 mL of water.

Molecular weight marker: Use a suitable molecular weight marker containing protein bands between 3.5 and 27 kDa.

Molecular weight standard solution: Transfer 16 μ L of the *Sample buffer* into a 0.5-mL microcentrifuge tube. Pipet 4 μ L of the *Molecular weight marker* into the microcentrifuge tube, and mix. Incubate the mixture in the closed microcentrifuge tube for 5 min at 95°. After

¹ A suitable gel staining solution is available from, e.g., Bio-Rad. Coomassie brilliant blue G-250 is available from Bio-Rad, Cat. # 161-0406.

² A suitable sample buffer is available as Tricine sample buffer from Bio-Rad, Cat. # 161-0739.

³ An undiluted suitable running buffer is available as 10 \times Tris/Tricine/SDS buffer from Bio-Rad, Cat. # 161-0744.

⁴ Available as 10 \times Tris/Tricine/SDS buffer from Bio-Rad, Cat. # 161-0744.

incubation, allow the tube to stand for 5 min at room temperature. Centrifuge at 5000 rpm for 1 min.

Alpha-Lactalbumin standard stock solution: 1.0% (w/v) of USP Alpha-Lactalbumin RS in water in a 2-mL centrifuge tube.

Alpha-Lactalbumin standard working solution: Pipet 21 μ L of the *Sample buffer* and 3 μ L of the *Alpha-Lactalbumin standard stock solution* into a 0.5-mL microcentrifuge tube, and mix. Proceed as directed for *Molecular weight standard solution* beginning with "Incubate the mixture".

Sample stock solution: 1.0% (w/v) of Alpha-Lactalbumin in water in a 2-mL centrifuge tube.

Sample solution: Pipet 21 μ L of the *Sample buffer* and 3 μ L of the *Sample stock solution* into a 0.5-mL microcentrifuge tube, and mix. Proceed as directed for *Molecular weight standard solution* beginning with "Incubate the mixture".

SDS-PAGE gel and apparatus set-up: Following the manufacturer's instructions, assemble and fill a 16.5% Tris-Tricine Ready Gel⁵ in the Mini-Protein III Electrophoresis Module,⁶ or in an equivalent module. Add *Running buffer* appropriately to this apparatus.

Analysis

Gel loading: Load 10 μ L of the *Molecular weight standard solution*, 2.5 μ L of the *Alpha-Lactalbumin standard working solution*, and 2.5 μ L of the *Sample solution*, respectively, into the 16.5% Tris-Tricine SDS-PAGE gel. [NOTE—The loaded samples contain approximately 3 μ g of protein based on the sample weight.]

Running the gel: Set the voltage to 100 V, and run at a constant voltage. Run the gel until the tracking dye front is approximately 10 mm from the bottom of the gel (approximately 80–90 min).

Gel fixing: Remove the gel, transfer to a plastic container, and soak in the *Gel fixing solution* for 30 min on a shaking rack. Decant the *Gel fixing solution*. Rinse with water, and decant.

Gel staining: Pour approximately 100 mL of the *Gel staining solution* into the staining container. Place the gel into the staining container, and allow the stain to completely cover the gel. Place the staining container on an appropriate shaker, and stain the gel for 60–90 min with gentle shaking.

Destaining: Drain the *Gel staining solution* into an appropriate waste container, and add 100 mL of *Destaining solution* to the container to cover the gel. Place the container on an appropriate shaker, and shake with gentle agitation for 30 min. Discard the used *Destaining solution*, and repeat destaining as necessary. Repeat rinsing with *Destaining solution* three to four times at 30-min intervals or until the gel is destained to the desired clarity.

Acceptance criteria: The Alpha-Lactalbumin has one major band at 14 kDa, a minor band at 16 kDa, and a molecular weight that is similar to that of USP Alpha-Lactalbumin RS.

- **B.** The retention time of the major peak for alpha-lactalbumin from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Alpha-Lactalbumin* in the *Assay*.

ASSAY

• CONTENT OF ALPHA-LACTALBUMIN

Mobile phase: Prepare a solution of 0.02 M Tris-HCl, 0.5% SDS, and 0.1 N sodium chloride. Adjust the pH of the solution to 5.95 ± 0.05 . Pass this solution through a filter having a 0.5- μ m or finer porosity, and degas.

Standard solution: 1.0 mg/mL of USP Alpha-Lactalbumin RS in *Mobile phase*. [NOTE—Prepare it immediately before use.]

System suitability solution: 0.5 mg/mL of USP Alpha-Lactalbumin RS and 0.5 mg/mL of beta-lactoglobulin in *Mobile phase*

Sample solution: 1.0 mg/mL of Alpha-Lactalbumin in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 7.8-mm \times 30-cm analytical column, packing L33

[NOTE—Equilibrate the column for approximately 90 min at 0.6 mL/min of *Mobile phase* or until a stable baseline is achieved.]

Flow rate: 0.6 mL/min

Injection size: 20 μ L

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for beta-lactoglobulin and alpha-lactalbumin are 0.91 and 1.00, respectively.]

Suitability requirements

Resolution: NLT 1.65 between beta-lactoglobulin and alpha-lactalbumin

Tailing factor: Not greater than 1.1 for the alpha-lactalbumin peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the purity of Alpha-Lactalbumin as a percentage of total protein:

$$\text{Result} = (r_U/r_S) \times [C_S/(C_U \times P)] \times 100$$

r_U = peak response for alpha-lactalbumin from the *Sample solution*

r_S = peak response for alpha-lactalbumin from the *Standard solution*

C_S = concentration of USP Alpha-Lactalbumin RS in the *Standard solution* (mg/mL)

C_U = concentration of Alpha-Lactalbumin in the *Sample solution* (mg/mL)

P = percentage of total protein content

Acceptance criteria: Content of alpha-lactalbumin is NLT 90.0% of the labeled total protein content.

• TOTAL PROTEIN CONTENT

Sample: 250 mg of Alpha-Lactalbumin

Analysis: Combust the *Sample* in the presence of pure oxygen (99.9%) in an airtight oven at 950° with a suitable nitrogen analyzer. The components such as carbon dioxide, sulfur dioxide, and moisture are absorbed by various in-line chemical filters. All nitrogenous matter is converted into nitrogen in the presence of catalytic converters. The weight percent of nitrogen is measured by a thermal conductivity detector. Blank the system by analyzing a suitable nitrogen blank material, such as powdered cellulose, and obtaining a zero reading. Calibrate and qualify the system by using EDTA. The relative standard deviation for replicate runs is NMT 0.5%. Calculate the weight percent of total protein content in Alpha-Lactalbumin by multiplying the percentage of nitrogen found by 6.23.

Acceptance criteria: Total protein content is NLT 90.0%.

OTHER COMPONENTS

• LIMIT OF BETA-LACTOGLOBULIN

Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability: Prepare as directed in the test for *Content of Alpha-Lactalbumin*.

Standard solution: 1.0 mg/mL of beta lactoglobulin in *Mobile phase*. [NOTE—Prepare it immediately before use.]

⁵ Available from Bio-Rad, Cat. # 161-1107 or 161-1179.

⁶ Available from Bio-Rad, Cat. # 165-3302.

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of beta-lactoglobulin as a percentage of total protein:

$$\text{Result} = (r_U/r_S) \times [C_S/(C_U \times P)] \times 100$$

- r_U = peak response for beta-lactoglobulin from the *Sample solution*
 r_S = peak response for beta-lactoglobulin from the *Standard solution*
 C_S = concentration of beta-lactoglobulin in the *Standard solution* (mg/mL)
 C_U = concentration of Alpha-Lactalbumin in the *Sample solution* (mg/mL)
 P = percentage of total protein content

Acceptance criteria: NMT 6.5%, calculated on the total protein basis

• **CONTENT OF CALCIUM**

Standard stock solution: Dissolve 1.249 g of calcium carbonate in 270 mL of 3 N hydrochloric acid (dilute 250 mL of hydrochloric acid with water to 1000 mL) in a 1000-mL volumetric flask. Dilute with water to volume, and mix. Dilute 50 mL of the solution so obtained to 1000 mL. The *Standard stock solution* contains 25 µg/mL of calcium.⁷

Lanthanum chloride solution: Weigh 11.7 g (± 100 mg) of lanthanum oxide, and transfer to a 1000-mL volumetric flask. Add enough water to wet the powder, and then slowly add 50 mL of hydrochloric acid. [**CAUTION**—Exothermic reaction.] Let the test specimen dissolve, dilute with water to volume, and mix. This solution contains 1% (w/v) of lanthanum and is stable for up to 6 months when stored at room temperature.

Blank solution: 10-fold dilution of *Lanthanum chloride solution*

Working standard solutions: To five identical 25-mL volumetric flasks add 0, 5, 10, 15, and 20 mL, respectively, of *Standard stock solution*. Add 2.5 mL of *Lanthanum chloride solution*, and dilute with water to volume. The *Working standard solutions* contain 0, 5, 10, 15, and 20 µg/mL of calcium, each containing 0.1% (w/v) of lanthanum.

Sample solution: Transfer 1.0 g of Alpha-Lactalbumin to a 100-mL volumetric flask, add 10 mL of *Lanthanum chloride solution*, and dilute with water to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 422.7 nm

Lamp: Calcium hollow-cathode lamp

Flame: Reduced air-acetylene

Analysis

Samples: *Working standard solutions* and *Sample solution*

Concomitantly determine the absorbances of the *Samples* using the *Blank solution*. [NOTE—Optimize flame parameters in accordance with the instrument manufacturer's instructions.]

Plot the absorbances of the *Working standard solutions* versus the concentration, in µg/mL, of calcium, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of calcium in the *Sample solution*.

Calculate the quantity of calcium (Ca), in mg, in each g of Alpha-Lactalbumin taken:

$$\text{Result} = (V \times C)/W \times F \times 100$$

V = volume of the *Sample solution*, 100 mL

C = as determined above

W = weight of Alpha-Lactalbumin taken to prepare the *Sample solution* (g)

F = conversion factor for µg to mg (10^{-3} mg/µg)

Acceptance criteria: NMT 1 mg/g of calcium

IMPURITIES

Inorganic Impurities

• **ASH:** Ignite 1 g of Alpha-Lactalbumin at NMT 550° until free from carbon. Cool in a desiccator, and weigh: NMT 3.5% is found.

• **HEAVY METALS, Method II (231):** NMT 10 ppm

• **LIMIT OF PHOSPHORUS**

Hydrochloric acid solution: Pipet 250 mL of hydrochloric acid into a 1000-mL volumetric flask, dilute with water to volume, and mix.

Molybdovanadate reagent: Dissolve 20 g of ammonium molybdate in 200 mL of water with the aid of heat, and then allow the molybdate solution to cool. Dissolve 1.0 g of ammonium vanadate in 125 mL of water with the aid of heat, cool, and add 160 mL of hydrochloric acid. Gradually add, with stirring, the molybdate solution to the vanadate solution, and dilute with water to 1000 mL.

Phosphorus standard stock solution I: Transfer 8.8 g of monobasic potassium phosphate (KH_2PO_4), previously dried for 2 h at 105°, to a 1000-mL volumetric flask, and add 750 mL of water to dissolve. Dilute with water to volume. This solution contains 2 mg/mL of phosphorus. [NOTE—Store the solution in a refrigerator.]

Phosphorus standard stock solution II: Immediately before use, dilute 50 mL of *Phosphorus standard stock solution I* with water to 1000 mL. [NOTE—Store in a refrigerator.]

Standard solutions: Transfer 0.0 mL, 5.0 mL, 8.0 mL, 10.0 mL, and 15.0 mL of *Phosphorus standard stock solution II*, respectively, to five identical 100-mL volumetric flasks. Proceed as directed in the *Analysis*: after treatment with the *Molybdovanadate reagent*, the resulting final phosphorus concentrations for the *Standard solutions* are 0.0, 5.0, 8.0, 10.0, and 15.0 µg/mL, respectively.

Sample solution: Transfer 4.0 g of Alpha-Lactalbumin to an ashing dish. Dry the test specimen on a hot plate or steam bath. Ignite in a muffle furnace at a maximum temperature of 600° until free of carbon. Cool, add 40 mL of *Hydrochloric acid solution* and several drops of nitric acid, and bring to boil on a hot plate. Cool, transfer to a 100-mL volumetric flask by rinsing the ashing dish with water, dilute with water to volume, and mix. Pipet 20.0 mL of the *Sample solution* into a 100-mL volumetric flask.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Analytical Wavelength: 400 nm

Analysis

Samples: *Standard solutions* and the *Sample solution*
To each of the flasks containing the *Samples*, add 20.0 mL of *Molybdovanadate reagent*, dilute with water to volume, mix, and allow to stand for exactly 10 min for maximum color development. The *Standard solutions* and the *Sample solution* are treated identically. Concomitantly determine the absorbances of each of the *Samples* in 1-cm cells using the *Spectrometric conditions* described above. Use one of the *Standard solutions* with phosphorus concentration at 0.0 µg/mL to zero the spectrophotometer. Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of phosphorus, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of phosphorus in the *Sample solution*.

⁷ A commercially prepared, certified AA standard is available as Calcium AA, ICP standards, 1000 ppm Ca in dilute hydrochloric acid, Cat. # ACA1KH, from RICCA. Make an appropriate dilution to obtain a final concentration of 25 µg/mL of calcium.

Calculate the quantity, in μg , of phosphorus in each g of Alpha-Lactalbumin taken:

$$\text{Result} = (V \times C)/W \times D$$

- V = volume of the *Sample solution*, 100 mL
 C = as determined above
 W = weight of Alpha-Lactalbumin taken to prepare the *Sample solution* (g)
 D = dilution factor, 5

Acceptance criteria: NMT 700 $\mu\text{g/g}$ of phosphorus

Organic Impurities

• PROCEDURE 1: LIMIT OF LIPID (FAT)

Weighing dish preparation: Pre-dry the clean dishes under the same conditions that will be used for final drying after fat extraction. Ensure that all surfaces where weighing dishes will be placed (i.e., hot plate, desiccator, etc.) are clean and free of particulates. At the end of oven drying, place the weighing dishes in a desiccator, and cool to room temperature. Immediately before use, weigh the dishes to the nearest 0.1 mg, and record the weights. Check the balance zero after weighing each dish. Protect the weighed dishes from contamination with extraneous matter.

Analysis

Transfer 0.5 g of Alpha-Lactalbumin to a Mojonnier-style ether extraction flask that has the capacity to hold a volume of 21–23 mL in the lower bulb plus neck at the bottom of the flask. The flask has a smooth, round opening at the top that can be sealed when closed with cork. Add 10 mL of water at a temperature of 40°, and mix. Add 1.5 mL of ammonium hydroxide to the Alpha-Lactalbumin, and mix thoroughly. Add 3 drops of phenolphthalein TS to help sharpen the visual appearance of the interface between the ether and the aqueous layers during extraction. Add 10 mL of alcohol, close with the cork stopper that has been water soaked, and shake the flask for 15 s.

For the first extraction, add 25 mL of ether, replace the cork stopper, and shake the flask very vigorously for approximately 1 min, releasing built-up pressure by loosening the stopper as necessary. Add 25 mL of petroleum ether, replace the cork stopper, and repeat vigorous shaking for about 1 min. Centrifuge the flask at about 600 rpm for NLT 30 s to obtain a clean separation of the aqueous (bright pink) and the ether phases. Decant the ether solution into a suitable weighing dish prepared as directed for *Weighing dish preparation*. When the ether solution is decanted into the dish, be careful not to pour any suspended solids or aqueous phase into the weighing dish. Ether can be evaporated at NMT 100° from the dish while conducting the second extraction.

For the second extraction, add 5 mL of alcohol to the original flask, close with the cork stopper, and shake vigorously for 15 s. Add 15 mL of ether, replace the cork, and shake the flask vigorously for about 1 min. Add 15 mL of petroleum ether, replace the cork stopper, and repeat vigorous shaking for about 1 min. Centrifuge the flask at about 600 rpm for NLT 30 s to obtain a clean separation of the aqueous (bright pink) and the ether phases. If the interface is below the neck of the flask, add water to bring the level about halfway up to the neck. Add water slowly down the inside surface of the flask so that there is minimum disturbance of the interface. Decant the ether solution for the second extraction into the same weighing dish used for the first extraction.

For the third extraction, omit addition of the alcohol and repeat the procedure used for the second extraction. Completely evaporate the solvents in a hood on a hot plate at NMT 100°, and avoid spattering. Dry the extracted fat and the weighing dish to constant weight in a forced air oven at 100° \pm 1° for NLT 30 min or in a vacuum oven at 70°

to 75° at more than 50.8 cm (20 inches) of vacuum for NLT 7 min. Remove the weighing dish from the oven, and place in a desiccator to cool to room temperature. Record the weight of the weighing dish containing the fat.

Run a blank determination using water, and record the weight of any dry residue collected. The reagent blank should be less than 2.0 mg of residue. [NOTE—A negative number is not acceptable.]

Calculate the weight percent of lipid (fat) in the portion of Alpha-Lactalbumin taken:

$$\text{Result} = [(W_2 - W_1) - W_3]/W \times 100$$

- W_1 = weight of empty weighing dish (g)
 W_2 = weight of the weighing dish containing fat (g)
 W_3 = weight of the reagent blank residue (g)
 W = weight of the Alpha-Lactalbumin taken for the fat extraction (g)

Acceptance criteria: NMT 1.0% is found. The difference between duplicate runs is NMT 0.03% fat.

• PROCEDURE 2: LIMIT OF LACTOSE

Carrez I solution: Transfer 3.60 g of potassium ferrocyanide [$\text{K}_4\text{Fe}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$] to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Carrez II solution: Transfer 7.20 g of zinc sulfate heptahydrate ($\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$) to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

[NOTE—The following four test reagents are included in a test kit.⁸]

Test reagent 1: About 600 mg of lyophilisate consisting of a mixture of citrate buffer (pH 6.6), nicotinamide adenine dinucleotide (NAD) (35 mg), anhydrous magnesium sulfate, and stabilizers (added if necessary). Dissolve lyophilisate in 7.0 mL of water before use.

Test reagent 2: About 1.7 mL of an enzyme suspension of β -galactosidase (approximately 100 Units).

Test reagent 3: 34 mL of a solution consisting of 0.51 M potassium diphosphate buffer (pH 8.6), and stabilizers (added if necessary).

Test reagent 4: About 1.7 mL of an enzyme suspension of galactose dehydrogenase (about 40 Units).

Sample solution: Transfer 1.0 g of Alpha-Lactalbumin to a 100-mL volumetric flask, add about 60 mL of water, and mix. Add 5 mL of *Carrez I solution*, and mix. Add 5 mL of *Carrez II solution*, and mix. Add 10 mL of 0.1 N sodium hydroxide solution, and mix vigorously. Dilute with water to volume, and mix. Pass through a filter paper, and use the clear filtrate. [NOTE—This procedure breaks emulsions, absorbs some colors, and precipitates proteins.]

Analysis

Label one glass or disposable plastic cuvet as “blank” and the second glass or disposable plastic cuvet as “test”. [NOTE—These two cuvetts should be equivalent.] To each cuvet, pipet 0.20 mL of *Test reagent 1* and 0.05 mL of *Test reagent 2*. Pipet 0.10 mL of the *Sample solution* into the cuvet that is labeled “test”. Mix both cuvetts with their stirrers, and incubate at 20°–25° for 20 min. Pipet 1.00 mL of *Test reagent 3* into each cuvet. Pipet 2.00 mL of water into the cuvet that is labeled “blank” and 1.90 mL of water into the cuvet containing the *Sample solution*. Mix, and incubate at 20°–25° for about 2 min.

Determine the absorbances, A_{51} and A_{61} , at 340 nm, for the *Sample solution* and the blank, respectively. Add

⁸ Available from Boehringer-Mannheim (R-Biopharm, Inc., 7950 Old US 27S, Marshall, MI 49068 USA; Tel: +1-877-789-3033 or +1-269-789-3033; Fax: +1-269-789-3070; www.r-biopharm.com).

0.05 mL of *Test reagent 4* to each cuvet. Mix and incubate at 20°–25° until the reaction has stopped (about 10–15 min). Determine the absorbances A_{S2} and A_{B2} , at 340 nm, again for the *Sample solution* and the blank, respectively. If the reaction has not stopped after 15 min, continue to read the absorbances at 2-min intervals until the absorbance for the *Sample solution* remains constant for two successive measurements.

Calculate the percentage of lactose in the portion of Alpha-Lactalbumin taken:

$$\text{Result} = V_1 \times V_2 \times M_r \times [(A_{S2} - A_{S1}) - (A_{B2} - A_{B1})] / (\epsilon \times L \times V_3 \times W) \times 100$$

- V_1 = volume of the *Sample solution*, 0.1 L
 V_2 = volume of the final sample solution in the cuvet, 3.30 mL
 M_r = molecular weight of lactose monohydrate, 360.32 g/mol
 ϵ = absorption coefficient of nicotinamide adenine dinucleotide reduced form (NADH) at 340 nm, 6300 L · mol⁻¹ · cm⁻¹
 L = light path of the cuvet, 1.0 cm
 V_3 = volume of the *Sample solution* taken into the cuvet, 0.1 mL
 W = weight of Alpha-Lactalbumin taken to prepare the *Sample solution* (g)
Acceptance criteria: NMT 1.0% of lactose

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic bacterial count does not exceed 1000 cfu/g. The total combined molds and yeasts count does not exceed 100 cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **DENATURATION TEMPERATURE**
Sample solution: Prepare a protein dough by mixing 3 g of Alpha-Lactalbumin powder with 2 g of water. Place the dough into a well-sealed sample container.
Analysis: Perform two measurements on the dough sample using a differential scanning calorimeter. Heat to 140°, and scan. Cool rapidly to below room temperature, and rescan. Apply a scan rate of 10°/min. Weigh pans before and after scanning to verify that no moisture loss occurs during the scanning process. Measure and record the denaturation temperatures as peak temperatures. The formation of two peaks indicates the presence of both the apo form and the holo form of Alpha-Lactalbumin.
Acceptance criteria: The denaturation temperature for Alpha-Lactalbumin in the apo form is between 50° and 52°; the denaturation temperature for Alpha-Lactalbumin in the holo form is between 58° and 61°.
- **PH** (791): NMT 7.5, in a solution (1 in 10)
- **LOSS ON DRYING** (731): Dry 1.0–1.5 g in a vacuum oven at 100°, at a pressure of 660 mm of mercury, and with continuous dry air feed for 5 h: it loses NMT 6.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at the temperature indicated on the label.
- **LABELING:** Label it to state the protein content, expressed as a total protein percentage. Indicate the type of source material, expressed as bovine milk, whey, or both, used to manufacture the final product. Label it to indicate the storage conditions, the expiration date, and the name and concentration of any added stabilizers.
- **USP REFERENCE STANDARDS** (11)
 USP Alpha-Lactalbumin RS

Lactic Acid—see *Lactic Acid General Monographs*

Lactitol

$C_{12}H_{24}O_{11}$	344.31
$C_{12}H_{24}O_{11} \cdot H_2O$	362.34
$C_{12}H_{24}O_{11} \cdot 2H_2O$	380.35

4-O-β-D-Galactopyranosyl-D-glucitol [585-86-4].
 Monohydrate [81025-04-9].
 Dihydrate [81025-03-8].

DEFINITION

Lactitol contains NLT 98.0% and NMT 101.0% of $C_{12}H_{24}O_{11}$, calculated on the anhydrous basis.

Detector: Refractive index

Column: 7.8-mm × 30-cm; packing L34

Column temperature: 85°

Flow rate: 0.7 mL/min

Injection size: 25 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 1.0% for lactitol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lactitol ($C_{12}H_{24}O_{11}$) in the portion of Lactitol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lactitol RS in the *Standard solution* (mg/mL)

C_U = concentration of Lactitol in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–101.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%

- **HEAVY METALS** (231)

Test preparation: Dissolve 4 g in 25 mL of water.

Acceptance criteria: NMT 5 ppm

- **RELATED COMPOUNDS**

Standard solution: 0.3 mg/mL of USP Lactitol RS

Sample solution: Prepare as directed in the *Assay*.

Chromatographic system: Proceed as directed in the *Assay*.

System suitability**Sample:** *Standard solution*

[NOTE—The relative retention times for lactose, glucose, galactose, lactulitol, lactitol, galactitol, and sorbitol are about 0.53, 0.58, 0.67, 0.72, 1.0, 1.55, and 1.68, respectively.]

Analysis**Samples:** *Standard solution* and *Sample solution*

Calculate the percentages of galactitol, sorbitol, lactulitol, lactose, glucose, and galactose in the portion of Lactitol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the relevant related compound, if observed, from the *Sample solution*

r_S = peak response of lactitol from the *Standard solution*

C_S = concentration of USP Lactitol RS in the *Standard solution* (mg/mL)

C_U = concentration of Lactitol in the *Sample solution* (mg/mL)

Acceptance criteria: The total of the percentages of all related compounds is NMT 1.5%.

• **REDUCING SUGARS**

Standard solution: Pipet 2 mL of a dextrose solution containing 0.5 mg/mL into a 10-mL conical flask.

Sample solution: Dissolve 500 mg in 2.0 mL of water in a 10-mL conical flask.

Analysis: Concomitantly add 1 mL of alkaline cupric tartrate TS to each solution, heat to boiling, and cool.

Acceptance criteria: NMT 0.2%, calculated as dextrose. The *Sample solution* shows no more turbidity than that produced in the *Standard solution*, in which a reddish brown precipitate forms.

SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** For the monohydrate form, 4.5%–5.5%; for the dihydrate form, 9.5%–10.5%; and for the anhydrous form, NMT 0.5%.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate whether it is the monohydrate, the dihydrate, or the anhydrous form.
- **USP REFERENCE STANDARDS (11)**
USP Lactitol RS

Lactobionic Acid

$C_{12}H_{22}O_{12}$ (acid form) 358.30
[96-82-2].

$C_{12}H_{20}O_{11}$ (δ -lactone) 340.28
[5965-65-1].

4-O- β -Galactopyranosyl-D-gluconic acid.

DEFINITION

Lactobionic Acid is a mixture in variable proportions of 4-O- β -D-galactopyranosyl-D-gluconic acid and 4-O- β -D-galactopyranosyl-D-glucono-1,5-lactone. It contains NLT 98.0% and NMT 102.0%, on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K):** [NOTE—If the spectra obtained show differences, dissolve the test substance and USP Lactobionic Acid RS separately in water, dry at 105°, and record new spectra using the residues.]

- **B. THIN-LAYER CHROMATOGRAPHY (621)**

Standard solution: 10 mg/mL of USP Lactobionic Acid RS

Sample solution: 10 mg/mL of Lactobionic Acid

Adsorbent: Chromatographic silica gel mixture with an average particle size of 10–15 μ m (TLC plates)

Developing solvent: Methanol, ethyl acetate, ammonium hydroxide, and water (2:1:1:1)

Application volume: 5 μ L

Spray reagent: Slowly add 10 mL of sulfuric acid to about 40 mL of water. Mix, and allow to cool. Dilute with water to 100 mL, and mix. Add 2.5 g of ammonium molybdate and 1 g of ceric sulfate, and shake for 15 min to dissolve.

Analysis: Develop the chromatograms until the solvent front has moved about three-fourths the length of the plate, and allow to dry. Spray the plate with *Spray reagent*, and allow to dry. Repeat two more times, heat at 110° for 15 min, and examine.

Acceptance criteria: The principal spot from the *Sample solution* is similar in position and color to the principal spot from the *Standard solution*.

ASSAY• **PROCEDURE**

Sample: 0.350 g of Lactobionic Acid

Analysis: Dissolve the *Sample* in 50 mL of carbon dioxide-free water, previously heated to 30°. Immediately titrate with 0.1 N sodium hydroxide, and determine the two equivalence points potentiometrically. (See *Titrimetry* (541).)

Each mL of 0.1 N sodium hydroxide consumed to the first equivalency point is equivalent to 35.83 mg of $C_{12}H_{22}O_{12}$ (corresponds to the acid form), and each mL of 0.1 N sodium hydroxide consumed between the first and second equivalency points is equivalent to 34.03 mg of $C_{12}H_{20}O_{11}$ (corresponds to the δ -lactone form).

Calculate the content, expressed as a percentage, of the lactobionic acid as the sum of both results.

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **HEAVY METALS (231)**

Thioacetamide reagent: To 0.2 mL of thioacetamide TS add 1 mL of a mixture of 5 mL of water, 15 mL of 1 M sodium hydroxide, and 20 mL of glycerin. Heat in a water bath for 20 s. [NOTE—Prepare immediately before use.]

Lead nitrate stock solution: Prepare as directed for *Special Reagents* in *Heavy Metals* (231).

Standard solution: On the day of use, dilute 2.0 mL of the *Lead nitrate stock solution* (10 ppm Pb) in water to 30 mL.

Sample solution: Dissolve 1 g of Lactobionic Acid in water to 30 mL.

Prepare the filtration apparatus by adapting the barrel of a 50-mL syringe without its piston to a support containing, on the plate, a membrane filter of 3- μ m pore size, and above it a prefilter.

Transfer the *Sample solution* into the syringe barrel, put the piston in place, and then apply an even pressure on it until the whole of the liquid has been filtered. When

opening the support and removing the prefilter, check that the membrane filter remains uncontaminated with impurities. If this is not the case, replace it with another membrane filter, and repeat the operation under the same conditions.

Analysis: To the prefiltrate, add 2 mL of pH 3.5 Acetate Buffer. Mix, and add 1.2 mL of Thioacetamide reagent. Mix immediately, allow to stand for 10 min, and again filter as described above, but inverting the order of the filters, the liquid passing first through the membrane filter before passing through the prefilter. The filtration must be carried out slowly and uniformly by applying moderate and constant pressure to the piston of the syringe. After complete filtration, open the support, remove the membrane filter, and dry using filter paper. In parallel, treat the *Standard solution* in the same manner as the *Sample solution*.

Acceptance criteria: The color of the spot from the *Sample solution* is not more intense than that from the *Standard solution* (NMT 20 ppm).

SPECIFIC TESTS

• WATER DETERMINATION, Method Ia (921)

Sample solution: 0.50 g in a mixture of methanol and formamide (2:1)

Acceptance criteria: NMT 5.0%

• APPEARANCE OF SOLUTION

Sample solution: 120 mg/mL of Lactobionic Acid

Standard stock solution: Pipet 24.0 mL of ferric chloride CS and 6.0 mL of cobaltous chloride CS into a 100-mL volumetric flask. Dilute with 1% (w/v) hydrochloric acid to volume.

Reference solution: Pipet 12.5 mL of the *Standard stock solution* into a 100-mL volumetric flask. Dilute with 1% (w/v) hydrochloric acid to volume.

Acceptance criteria: The *Sample solution* is clear and not more intensely colored than the *Reference solution*.

• OPTICAL ROTATION, Specific Rotation (781S)

Sample solution: 10 mg/mL of Lactobionic Acid. Allow to stand for 24 h.

Acceptance criteria: +23.0° to +29.0° (anhydrous substance)

• REDUCING SUGARS

Sample solution: Dissolve 5.0 g of Lactobionic Acid in 25 mL of water with the aid of gentle heat, and cool.

Analysis: To the *Sample solution* add 20 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 min, and maintain boiling for 3 min. Cool rapidly, and add 100 mL of a 2.4% solution of glacial acetic acid and 20.0 mL of 0.025 M iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess iodine with 0.05 M sodium thiosulfate VS using 1 mL of starch TS, added toward the end of the titration as an indicator.

Acceptance criteria: NLT 12.8 mL of 0.05 M sodium thiosulfate VS is required, corresponding to NMT 0.2% of reducing sugars, as glucose.

• ARTICLES OF BOTANICAL ORIGIN, Total Ash (561): NMT 0.2%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11) USP Lactobionic Acid RS

Anhydrous Lactose

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

DEFINITION

Anhydrous Lactose is *O*-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose (β-lactose), or a mixture of *O*-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose and *O*-β-D-galactopyranosyl-(1→4)-α-D-glucopyranose (α-lactose).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• ♦B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Diluent: Methanol and water (3:2)

Standard solution A: 0.5 mg/mL of USP Anhydrous Lactose RS in *Diluent*

Standard solution B: Contains 0.5 mg/mL of USP Dextrose RS, 0.5 mg/mL of USP Anhydrous Lactose RS, 0.5 mg/mL of USP Fructose RS, and 0.5 mg/mL of USP Sucrose RS in *Diluent*

Sample solution: 0.5 mg/mL of Anhydrous Lactose in *Diluent*

Application volume: 2 μL

Developing solvent system: Ethylene dichloride, glacial acetic acid, methanol, and water (10:5:3:2)

Spray reagent: 5 mg/mL of thymol in a mixture of alcohol and sulfuric acid (19:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Allow the spots to dry, and develop the plate in a paper-lined chromatographic chamber equilibrated with the *Developing solvent system* for about 1 h prior to use. Allow the chromatogram to develop until the solvent front has moved about three-quarters of the length of the plate. Remove the plate from the chamber, dry in a current of warm air, and redevelop the plate in fresh *Developing solvent system*. Remove the plate from the chamber, mark the solvent front, and dry the plate in a current of warm air. Spray the plate evenly with *Spray reagent*. Heat the plate at 130° for 10 min.

System suitability: The test is not valid unless *Standard solution B* shows four clearly discernible spots, disregarding any spots at the origin.

Acceptance criteria: The principal spot from the *Sample solution* corresponds in appearance and *R_f* value to that from *Standard solution A*.♦

OTHER COMPONENTS

• ♦CONTENT OF ALPHA AND BETA ANOMERS

Silylation reagent: Dimethyl sulfoxide, pyridine, and trimethylsilylimidazole (19.5: 58.5: 22)

Standard solution: Prepare a mixture of alpha-lactose monohydrate and beta-lactose having an anomeric ratio of about 1:1 based on the labeled anomeric contents of the alpha-lactose monohydrate and the beta-lactose. In-

Introduce 10 mg of this mixture into a vial with a screw cap. Add 4 mL of *Silylation reagent*. Sonicate for 20 min at room temperature. Transfer 400 µL to an injection vial. Add 1 mL of pyridine. Close the vial, and mix well.

Sample solution: Introduce 10 mg of Anhydrous Lactose into a vial with a screw cap. Add 4 mL of *Silylation reagent*. Sonicate for 20 min at room temperature. Transfer 400 µL to an injection vial. Add 1 mL of pyridine. Close the vial, and mix well.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Columns

IMPURITIES

- ♦ **HEAVY METALS**, *Method II* <231>: NMT 5 ppm♦
- ♦ **RESIDUE ON IGNITION** <281>: NMT 0.1%

SPECIFIC TESTS

♦ CLARITY AND COLOR OF SOLUTION

Hydrazine sulfate solution: Dissolve 1.0 g of hydrazine sulfate in water, and dilute to 100.0 mL. Allow to stand for 4–6 h.

Hexamethylenetetramine solution: In a 100-mL ground-glass stoppered flask dissolve 2.5 g of hexamethylenetetramine in 25.0 mL of water.

Primary opalescent suspension: To the *Hexamethylenetetramine solution* in the flask add 25.0 mL of the *Hydrazine sulfate solution*. Mix and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

Standard opalescence: Dilute 15.0 mL of the *Primary opalescent suspension* to 1000.0 mL with water. This suspension is freshly prepared and may be stored for up to 24 h.

Reference suspension: To 5.0 mL of the *Standard opalescence* add 95.0 mL of water. Mix and shake before use.

Reference solution: To 6.0 mL of ferric chloride CS, 2.5 mL of cobaltous chloride CS, and 1.0 mL of cupric sulfate CS add hydrochloric acid (10 g/L HCl) to make 1000 mL.

Sample solution: 1 g in 10 mL of boiling water. Allow to cool.

Instrumental conditions

Mode: Vis

Analytical wavelength: 400 nm

Acceptance criteria: NMT 0.04 for the absorbance divided by the path length in centimeters; and the clarity of the *Sample solution* is the same as that of water or its opalescence is not more pronounced than that of the *Reference suspension*, and it is not more colored than the *Reference solution*.

♦ LOSS ON DRYING <731>

Analysis: Dry a sample at 80° for 2 h.

Acceptance criteria: NMT 0.5%

♦ WATER DETERMINATION, *Method I* <921>

Sample solution: Anhydrous Lactose in a mixture of methanol and formamide (2:1)

Acceptance criteria: NMT 1.0%

♦ MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>

The total aerobic microbial count is NMT 10^2 cfu/g and ♦the total combined molds and yeasts count is NMT 50 cfu/g♦. It meets the requirements of the test for absence of *Escherichia coli*.

♦ PROTEIN AND LIGHT-ABSORBING IMPURITIES

(See *Spectrophotometry and Light-Scattering* <851>.)

Sample solution: 1% solution (w/v)

Instrumental conditions

Mode: UV

Wavelength range: 210–300 nm

Acceptance criteria: NMT 0.25 for the absorbance divided by the path length in centimeters at 210–220 nm; NMT 0.07 for the absorbance divided by the path length in centimeters at 270–300 nm

♦ ACIDITY OR ALKALINITY

Sample solution: Dissolve 6 g by heating in 25 mL of carbon dioxide-free water, cool, and add 0.3 mL of phenolphthalein TS.

Acceptance criteria: The solution is colorless, and NMT 0.4 mL of 0.1 N sodium hydroxide is required to produce a pink or red color.

♦ OPTICAL ROTATION, *Specific Rotation* <781S>

Sample solution: Dissolve 10 g by heating in 80 mL of water to 50°. Allow to cool, and add 0.2 mL of 6 N ammonium hydroxide. Allow to stand for 30 min, and dilute with water to 100 mL.

Acceptance criteria: +54.4° to +55.9°, calculated on the anhydrous basis, at 20°

ADDITIONAL REQUIREMENTS

- ♦ **PACKAGING AND STORAGE:** Preserve in tight containers.
- ♦ **LABELING:** Where the labeling indicates the relative quantities of alpha- and beta-lactose, determine compliance using *Content of Alpha and Beta Anomers*.

¹ Restek Guard column is suitable.

² Varian CP-Sil 8 CB is suitable.

Where the labeling states the particle size distribution, it also indicates the d_{10} , d_{50} , and d_{90} values and the range for each.

Lanolin, Anhydrous—see *Lanolin General Monographs*

Lanolin, Modified—see Modified Lanolin General Monographs

Lanolin Alcohols

[8027-33-6].

DEFINITION

Lanolin Alcohols is a mixture of aliphatic alcohols, triterpenoid alcohols, and sterols, obtained by the hydrolysis of Lanolin. It may contain NMT 0.1% of a suitable antioxidant.

IDENTIFICATION

- **A.**
Sample: 0.5 g
Analysis: Dissolve the *Sample* in 5 mL of chloroform, and add 1 mL of acetic anhydride and 2 drops of sulfuric acid.
Acceptance criteria: A green color is produced.

ASSAY

- **CONTENT OF STEROLS** (as cholesterol)
Sample: 20 g
Analysis: Melt the *Sample* on a water bath, mix, and allow to cool. Dissolve 100 mg in 12 mL of warm (60°) 90% alcohol. Allow to stand for 18 h, pass through a medium-porosity, sintered-glass filter, and wash the residue with two 15-mL portions of 90% alcohol. Combine the filtrate and washings, add 20 mL of a freshly prepared 1-in-100 solution of digitonin in 90% alcohol, and warm to 60°. Allow to cool, pass through a medium-porosity, sintered-glass filter with the aid of gentle vacuum, wash the residue with 10 mL of 90% alcohol, and dry at 105° to constant weight. Each g of residue is equivalent to 0.239 g of cholesterol.
Acceptance criteria: NLT 30.0% of sterols, calculated as cholesterol

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.15%
- **COPPER**
Solution A: 1 mg/mL of sodium diethyldithiocarbamate
Sample: 5.0 g
Control: Add 1 mL of *Solution A* and a few drops of 6 N ammonium hydroxide to 2.5 mL of a 39.3-ppm solution of cupric sulfate. Dilute with water to 50 mL.
Analysis: Heat the *Sample* over a small flame until charred, ignite the residue at 550°, and dissolve the ash in 5 mL of hydrochloric acid, with the aid of heat. Cool, dilute with water, render alkaline with ammonium hydroxide, boil to remove the excess ammonia, add a few drops of bromine TS, boil again, and filter. To the filtrate add 1 mL of *Solution A*, a few drops of 6 N ammonium hydroxide, and sufficient water to bring the volume to 50 mL.
Acceptance criteria: The *Sample* is not darker than the *Control* (5 ppm).

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, *Class II* (741): NLT 56°
- **ACIDITY AND ALKALINITY**
Analysis: Boil 10 g with 100 mL of water for 5 min, with frequent stirring. Remove the source of heat, add 0.5 mL of phenolphthalein TS, and stir.
Acceptance criteria: No pink color is produced. Add 0.5 mL of methyl orange TS, and stir: no red color is produced.

- **LOSS ON DRYING** (731)
Analysis: Dry at 105° for 1 h.
Acceptance criteria: NMT 0.5%
- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 2.0.
- **FATS AND FIXED OILS**, *Hydroxyl Value* (401): 120–180
- **FATS AND FIXED OILS**, *Peroxide Value* (401)
Sample: Take wedge-shaped pieces with bases that contain part of the surface.
Analysis: Melt the pieces before carrying out the determination. Before adding the 0.5 mL of saturated potassium iodide solution, cool the solution obtained to room temperature.
Acceptance criteria: NMT 15
- **FATS AND FIXED OILS**, *Saponification Value* (401)
Sample: 5 g of molten Lanolin Alcohols
Analysis: Reflux the *Sample* with the alcoholic potassium hydroxide for 4 h.
Acceptance criteria: NMT 12

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, and store at controlled room temperature.
- **LABELING:** Label it to indicate the name and quantity of any antioxidant added.

Lauroyl Polyoxylglycerides

DEFINITION

Lauroyl Polyoxylglycerides is a mixture of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols. The polyethylene glycols used have a mean molecular weight between 300 and 1500. The article is produced by partial alcoholysis of saturated oils, mainly containing triglycerides of lauric acid with polyethylene glycols, by esterification of glycerol and polyethylene glycols with fatty acids, or as a mixture of glycerol esters and ethylene oxide condensate with the fatty acids of the hydrogenated oils. It may contain free polyethylene glycols.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)
Standard solution: 50 mg/mL of USP Lauroyl Polyoxylglycerides RS in methylene chloride
Sample solution: 50 mg/mL of Lauroyl Polyoxylglycerides in methylene chloride
Application volume: 10 µL
Developing solvent system: Ether and hexanes (70:30)
Spray reagent: 0.1 mg/mL of rhodamine B in alcohol
Analysis
Samples: *Standard solution* and *Sample solution*
 Proceed as directed in the chapter. Then spray the plate with *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.
Acceptance criteria: The *R_f* values of the principal spots from the *Sample solution* correspond to those from the *Standard solution*.
- **C.** It meets the requirements in *Specific Tests* (see Table 2) for *Fats and Fixed Oils*, *Fatty Acid Composition* (401).

IMPURITIES

- **HEAVY METALS**, *Method II* (231): NMT 10 µg/g
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 0.1%
- **ALKALINE IMPURITIES**
Sample: 5.0 g
Analysis: Heat the *Sample* slightly until the test substance melts, add 10 mL of alcohol and 0.05 mL of bro-

mophenol blue TS, and mix well. While the solution is still warm, titrate with 0.01 N hydrochloric acid VS to change the color to yellow.

Acceptance criteria: NMT 1.0 mL of 0.01 N hydrochloric acid is required.

• **LIMIT OF FREE ETHYLENE OXIDE AND DIOXANE**

[CAUTION—Ethylene oxide is toxic and flammable. Prepare all solutions in a well-ventilated hood. The operator must protect hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at 4°–8°.]

[NOTE—Perform all determinations three times.]

Magnesium chloride solution: 500 mg/mL of magnesium chloride in alcohol

Ethylene oxide stock solution: Into a dry, clean test tube, cooled in a mixture of sodium chloride and crushed ice (1:3), introduce a slow current of ethylene oxide gas, allowing condensation onto the inner wall of the test tube. Using a glass syringe, previously cooled to –10°, transfer 300 µL of liquid ethylene oxide, equivalent to 0.25 g, to 50 mL of polyethylene glycol 200. Determine the absorbed quantity of ethylene oxide by weighing before and after absorption. Dilute with polyethylene glycol 200 to 100.0 mL.

Standardize this solution by transferring 10.0 mL of *Magnesium chloride solution* and 20.0 mL of 0.1 M alcoholic hydrochloric acid VS to a volumetric flask. Insert the stopper, shake to obtain a saturated solution, and allow to equilibrate overnight. Transfer 5.00 mL of *Ethylene oxide stock solution* to the flask, and allow to stand for 30 min. Titrate with 0.1 M alcoholic potassium hydroxide VS. Perform a blank titration, using the same quantity of polyethylene glycol 200 instead of *Ethylene oxide stock solution*, and note the difference in volumes required. Each mL of the difference in volumes of 0.1 M alcoholic potassium hydroxide VS consumed is equivalent to 4.404 mg of ethylene oxide. Calculate the concentration of ethylene oxide in the *Ethylene oxide stock solution*.

Ethylene oxide solution: Prepare immediately before use. Dilute a volume of *Ethylene oxide stock solution* with polyethylene glycol 200 to obtain a solution containing about 50 µg/g of ethylene oxide. Dilute 1.0 mL of this solution with water to 5.0 mL to obtain a solution having a concentration of 10 µg/mL of ethylene oxide.

Dioxane solution: 0.5 mg/mL of dioxane

Standard solution A: Transfer 1.0 g of Lauroyl Polyoxylglycerides to a 10-mL vial, and add 1.0 mL of *N,N*-dimethylacetamide, 0.1 mL of *Ethylene oxide solution*, and 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogeneous solution. Allow to stand at 90° for 45 min.

Standard solution B: Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL vial, add 0.1 mL of a freshly prepared 10 mg/L of acetaldehyde solution, and add 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogeneous solution.

Sample solution: Transfer 1.0 g of Lauroyl Polyoxylglycerides to a 10-mL vial, and add 1.0 mL of *N,N*-dimethylacetamide and 0.2 mL of water. Close the vial, and mix to obtain a homogeneous solution. Allow to stand at 90° for 45 min.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

[NOTE—Headspace apparatus that automatically transfers a measured amount of headspace may be used.]

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m glass or quartz capillary, bonded with a 1.0-µm layer of phase G1

Temperatures

Injection port: 150°

Detector: 250°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	—	50	5
50	5	180	—
180	30	230	5

Carrier gas: Helium

Flow rate: 1 mL/min

Injection volume: 1 mL

System suitability

Sample: Gaseous phase of *Standard solution B*

[NOTE—The relative retention times for acetaldehyde and ethylene oxide are about 0.94 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between acetaldehyde and ethylene oxide

Relative standard deviation: NMT 15.0%

Analysis

Samples: *Standard solution A* and *Sample solution*

Using a heated, gas-tight gas chromatographic syringe, separately inject equal volumes of the gaseous headspace of *Standard solution A* and of the *Sample solution* into the chromatograph, record the chromatograms, and measure the peak responses. **[NOTE—**Adjust the sensitivity of the system so that the heights of the two principal peaks are NLT 15% of the full scale of the recorder.]

Calculate the concentration of ethylene oxide in the sample taken:

$$\text{Result} = \{(C \times r_U) / [(r_S \times M_U) - (r_U \times M_S)]\}$$

C = concentration of ethylene oxide in *Standard solution A* (µg/mL)

r_U = peak response of ethylene oxide from the *Sample solution*

r_S = peak response of ethylene oxide from *Standard solution A*

M_U = quantity of Lauroyl Polyoxylglycerides taken to prepare the *Sample solution* (g)

M_S = quantity of Lauroyl Polyoxylglycerides taken to prepare *Standard solution A* (g)

Calculate the concentration of dioxane in the sample taken:

$$\text{Result} = C_D \times d_U / 5 \times [(d_S \times M_U) - (d_U \times M_S)]$$

C_D = concentration of dioxane in *Standard solution A* (µg/mL)

d_U = peak response of dioxane from the *Sample solution*

d_S = peak response of dioxane from *Standard solution A*

M_U = quantity of Lauroyl Polyoxylglycerides taken to prepare the *Sample solution* (g)

M_S = quantity of Lauroyl Polyoxylglycerides taken to prepare *Standard solution A* (g)

Acceptance criteria

Ethylene oxide: NMT 1 µg/g; the peak area of ethylene oxide from the *Sample solution* is NMT half the corresponding peak area from *Standard solution A*.

Dioxane: NMT 10 µg/g; the peak area of dioxane from the *Sample solution* is NMT half the corresponding peak area from *Standard solution A*.

• **LIMIT OF FREE GLYCEROL**

Sample: 1.2 g

Periodic acetic acid solution: Dissolve 0.446 g of sodium periodate in 2.5 mL of a 25% (v/v) solution of sulfuric acid, diluting to 100.0 mL with glacial acetic acid.

Potassium iodide solution: 75 mg/mL of potassium iodide

Blank: 25 mL of methylene chloride

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 M sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 25 mL of methylene chloride, heating if necessary. Cool, and add 100 mL of water and 25.0 mL of *Periodic acetic acid solution*. Shake, and allow to stand for 30 min. Add 40 mL of *Potassium iodide solution*, and allow to stand for 1 min. Add 1 mL of starch TS, and titrate the liberated iodine with 0.1 M sodium thiosulfate VS. Perform a blank determination, and make any necessary correction.

Calculate the percentage of glycerol in the sample taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = Titrant volume consumed by the *Sample* (mL)

V_B = Titrant volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 23.0 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: NMT 5.0%

SPECIFIC TESTS

• **FATS AND FIXED OILS, Acid Value (401)**

Sample: 2.0 g

Acceptance criteria: NMT 2.0

• **FATS AND FIXED OILS, Fatty Acid Composition (401):** Lauroyl Polyoxylglycerides exhibits the composition profile of fatty acids shown in *Table 2*.

Table 2

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
8	0	≤15.0
10	0	≤12.0
12	0	30.0–50.0
14	0	5.0–25.0
16	0	4.0–25.0
18	0	5.0–35.0

• **FATS AND FIXED OILS, Hydroxyl Value (401)**

Sample: 1.0 g

Acceptance criteria: Within the range specified in *Table 3* for the labeled type

Table 3

Type of Polyethylene Glycols	Hydroxyl Value
300	65–85
400	60–80
600	50–70
1500	36–56

• **FATS AND FIXED OILS, Iodine Value (401):** NMT 2.0

• **FATS AND FIXED OILS, Peroxide Value (401)**

Sample: 2.0 g

Acceptance criteria: NMT 6.0

• **FATS AND FIXED OILS, Saponification Value (401)**

Sample: 2.0 g

Acceptance criteria: Within the range specified in *Table 4* for the labeled type

Table 4

Type of Polyethylene Glycols	Saponification Value
300	190–204
400	170–190
600	150–170
1500	79–93

• **WATER DETERMINATION, Method I (921)**

Sample: 1.0 g

Analysis: Instead of using methanol as the solvent, one of two solvent systems can be used: a mixture of methylene chloride and anhydrous methanol (70:30 v/v), or anhydrous pyridine.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light and moisture. Store at controlled room temperature.

• **LABELING:** Label it to indicate the type and the average nominal molecular weight of polyethylene glycols used as part of the official title.

• **USP REFERENCE STANDARDS (11)**

USP Lauroyl Polyoxylglycerides RS

Lecithin

[8002-43-5].

DEFINITION

Lecithin is a complex mixture of acetone-insoluble phosphatides, which consist chiefly of phosphatidylcholine, phosphatidylethanolamine, phosphatidylserine, and phosphatidylinositol, combined with various amounts of other substances such as triglycerides, fatty acids, and carbohydrates, as separated from the crude vegetable oil source. It contains NLT 50.0% of acetone-insoluble matter.

IDENTIFICATION

• **A.**

Sample: 1 g of Lecithin

Analysis: Transfer the *Sample* to a Kjeldahl flask, add 5 g of potassium sulfate, 0.5 g of cupric sulfate, and 20 mL of sulfuric acid. Incline the flask to a 45° angle, heat gently until the effervescence almost ceases, and raise the temperature to boiling. After the contents become a blue, transparent solution, heat for 1–2 h, cool, and add an equal volume of water. To 5 mL of this solution, add 10 mL of ammonium molybdate solution (1 in 5), and heat.

Acceptance criteria: A yellow precipitate is formed.

• **B. PAPER CHROMATOGRAPHY**

Standard solution: Choline chloride solution (1 in 200) using USP Choline Chloride RS

Sample solution: To 0.5 g of Lecithin, add 5 mL of hydrochloric acid solution (1 in 2), heat in a water bath for 2 h, and filter.

Chromatographic system

(See *Chromatography* (621), *Paper Chromatography*.)

Mode: Paper

Developing solvent system: *n*-Butanol, water, and acetic acid (4:2:1)

Application volume: 10 µL

Spray reagent: Dragendorff's TS

Analysis

Samples: *Standard solution* and *Sample solution*

Use a suitable cellulose filter paper for chromatography. Develop the chromatogram over a path of 25 cm, and dry the paper in a current of air. Spray the paper with

Spray reagent to develop a red-orange color, and locate the spots on the paper by examination under daylight.

Acceptance criteria: The R_f value of the principal spot from the *Sample solution* corresponds to that from the *Standard solution*.

ASSAY

• CONTENT OF ACETONE-INSOLUBLE MATTER

Sample: If the substance under test is plastic or semi-solid, soften the Lecithin by warming it briefly at a temperature not exceeding 60°, and then mix. Transfer 2 g to a 40-mL centrifuge tube that previously has been tared along with a stirring rod, cool, and weigh.

Analysis: To the *Sample* add 15.0 mL of acetone, warm carefully in a water bath to melt the test specimen without evaporating the acetone. Stir to help dissolve completely, and place in an ice-water bath for 5 min. Add acetone that has been previously chilled to 0°–5° to the 40-mL mark on the tube, stirring during the addition. Cool in an ice-water bath for 15 min, stir, remove the rod, clarify by centrifuging at about 2000 rpm for 5 min, and decant. Break up the residue with the stirring rod, and refill the centrifuge tube to the 40-mL mark with chilled acetone, while stirring. Cool in an ice-water bath for 15 min, stir, remove the rod, centrifuge, and decant. Break up the residue with the stirring rod. Place the tube in a horizontal position until most of the acetone has evaporated. Mix again, and heat the tube containing the acetone-insoluble residue and the stirring rod at 105° to constant weight.

[**CAUTION**—Acetone is flammable.]

Determine the weight of the residue, and calculate the percentage of acetone-insoluble matter.

Acceptance criteria: NLT 50.0%

IMPURITIES

• **HEAVY METALS**, *Method II* (231): NMT 20 ppm

• **LEAD** (251): NMT 10 ppm

• HEXANE-INSOLUBLE MATTER

Sample: If the substance under test is plastic or semi-solid, soften the Lecithin by warming it at a temperature not exceeding 60°, and then mix. Weigh 10.0 g into a 250-mL conical flask.

Analysis: To the *Sample* add 100 mL of hexanes. Shake until solution is apparently complete or until no more residue seems to be dissolving. Pass through a coarse-porosity filtering funnel that previously has been heated at 105° for 1 h, cooled, and weighed, wash the flask with two 25-mL portions of hexanes, and pour both washings through the funnel. Dry the funnel at 105° for 1 h. [**CAUTION**—Hexane is flammable.] Cool to room temperature, and determine the gain in weight.

Acceptance criteria: NMT 0.3%

SPECIFIC TESTS

• FATS AND FIXED OILS, *Acid Value* (401)

Sample: If the substance under test is plastic or semi-solid, soften the Lecithin by warming it briefly at a temperature not exceeding 60°, and then mix. Transfer 2 g to a 250-mL conical flask.

Analysis: Dissolve the *Sample* in 50 mL of petroleum ether. To this solution add 50 mL of alcohol, previously neutralized to phenolphthalein with 0.1 N sodium hydroxide, and mix. Add phenolphthalein TS. Titrate with 0.1 N sodium hydroxide VS to a pink endpoint that persists for 5 s.

Calculate the amount, in mg, of potassium hydroxide required to neutralize the free acids in 1.0 g of the Lecithin:

$$\text{Result} = (M_R \times N \times V) / W$$

M_R = molecular mass of potassium hydroxide, 56.11

N = normality of the sodium hydroxide VS

V = volume of the sodium hydroxide VS consumed in the titration (mL)

W = weight of Lecithin taken (g)

Acceptance criteria: NMT 36

Change to read:

• PEROXIDE VALUE

Sample: 5 g of Lecithin

Analysis: Transfer the *Sample* into a 250-mL Erlenmeyer flask with a ground-glass stopper, add 35 mL of a mixture of chloroform and glacial acetic acid (2:1), • (ERR 1-May-2012) and mix. Completely dissolve the test specimen while shaking gently. The solution becomes transparent. Completely replace the air in the flask with nitrogen. While purging with nitrogen, add 1 mL of potassium iodide solution (165 mg/mL of potassium iodide), then stop the flow of the nitrogen, and immediately place a stopper in the flask. Shake for 1 min, and allow to stand in a dark place for 5 min. Add 75 mL of water, replace the stopper again, and shake vigorously. Titrate with 0.01 N sodium thiosulfate VS, adding starch TS as the endpoint is approached, and continue the titration until the blue starch color has just disappeared. Perform a blank determination (see *Titrimetry* (541)), and make any necessary correction. Calculate the peroxide value, as milliequivalents of peroxide per 1000 g of Lecithin:

$$\text{Result} = (S \times N / W) \times 1000$$

S = net volume of sodium thiosulfate solution required for titration (mL)

N = normality of the sodium thiosulfate solution

W = weight of Lecithin taken (g)

Acceptance criteria: NMT 10

• WATER DETERMINATION, *Method I* (921): NMT 1.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers. Store at the temperature indicated on the label. Protect from excess heat and moisture.
- **LABELING:** Label it to indicate the storage conditions.
- **USP REFERENCE STANDARDS** (11)
USP Choline Chloride RS

Lemon Oil

DEFINITION

Lemon Oil is the volatile oil obtained by expression, without the aid of heat, from the fresh peel of the fruit of *Citrus x limon* (L.) Osbeck (Fam. Rutaceae), with or without the previous separation of the pulp and the peel. The total aldehyde content, calculated as citral ($C_{10}H_{16}O$), is NLT 2.2% and NMT 3.8% for California-type Lemon Oil, and NLT 3.0% and NMT 5.5% for Italian-type Lemon Oil. [NOTE—Do not use Lemon Oil that has a terebinthine odor.]

ASSAY

• TOTAL ALDEHYDE CONTENT

Reagent solution: Dissolve 4.5 g of hydroxylamine hydrochloride in 13 mL of water. Add 85 mL of tertiary butyl alcohol, mix, and adjust with 0.5 N potassium hydroxide to a pH of 3.4.

Sample: 5 mL

Analysis: Pipet 50 mL of the *Reagent solution* into a conical flask containing the *Sample*. Insert the stopper in the flask, and allow to stand at room temperature for

30 min, with occasional shaking. Titrate the liberated hydrochloric acid with 0.5 N alcoholic potassium hydroxide VS to a pH of 3.4. Each mL of 0.5 N alcoholic potassium hydroxide consumed in the titration is equivalent to 76.12 mg of total aldehydes, calculated as citral (C₁₀H₁₆O).

Acceptance criteria: The total aldehyde content, calculated as citral (C₁₀H₁₆O), is 2.2%–3.8% for California-type Lemon Oil or 3.0%–5.5% for Italian-type Lemon Oil.

IMPURITIES

- **HEAVY METALS, Method II** <231>: NMT 40 µg/g

SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>: 0.849–0.855
- **OPTICAL ROTATION, Angular Rotation** <781A>: +57° to +65.6°
- **REFRACTIVE INDEX** (831): 1.473–1.476 at 20°
- **ULTRAVIOLET ABSORBANCE**

Sample solution: Dilute 250 mg of Oil to 100 mL with alcohol

Blank: Alcohol

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: UV-Vis

Spectral range: 260–400 nm

Analysis

Samples: *Sample solution* and *Blank*

Record the spectrum in a 1-cm cell, and determine the absorbance at the wavelength of maximum absorbance at about 315 nm using the line drawn tangent to the curves appearing as minima in the spectrum in wavelength regions above and below the maximum wavelength as the baseline.

Acceptance criteria: The absorbance, calculated on the basis of a 250-mg specimen, is NLT 0.20 for California-type Lemon Oil or NLT 0.49 for Italian-type Lemon Oil.

- **FOREIGN OILS:** Place 50 mL of Oil in a four-bulb Ladenburg flask having the following dimensions: the lower or main bulb is about 6 cm in diameter, and the smaller condensing bulbs are about 3.5, 3.0, and 2.5 cm in diameter; the distance from the bottom of the flask to the side-arm is about 20 cm. Distill Oil at a rate of 1 drop/s until the distillate measures 5 mL: the angular rotation of the first 5 mL is NMT 6° less than that of the original Oil. The refractive index at 20° of this same portion is 0.001–0.003 lower than that of the original Oil.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-filled, tight containers, and avoid exposure to excessive heat.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived. Label it to also indicate whether it is California-type or Italian-type Lemon Oil. The label indicates that Oil is not to be used if it has a terebinthine odor.

Lemon Tincture

DEFINITION

Lemon Tincture is prepared from lemon peel, which is the outer yellow rind of the fresh, ripe fruit of *Citrus × Limon* Osbeck (Fam. Rutaceae).

Prepare Lemon Tincture as follows.

Lemon Peel	500 g
Alcohol	900 mL
Alcohol, a sufficient quantity to make	1000 mL

Macerate the *Lemon Peel* in 900 mL of *Alcohol* in a closed container, and store in a warm place. Agitate the container frequently for 3 days or until the soluble matter is dissolved. Transfer the mixture to a filter, using talc as the filtering medium, and when most of the liquid has drained away, wash the residue on the filter with a sufficient amount of *Alcohol*, and combine the filtrates so that the preparation is brought to a final volume of 1000 mL.

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I** <611>: 62%–72% of the labeled amount

IMPURITIES

- **HEAVY METALS, Method II** <231>: NMT 40 µg/mL

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat. Store at controlled room temperature.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived.

Licorice Fluidextract

DEFINITION

Prepare Licorice Fluidextract as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>). To 1000 g of coarsely ground Licorice, add about 3000 mL of boiling Purified Water, mix, and allow to macerate in a suitable, covered percolator for 2 h. Allow the percolation to proceed at a rate of 1–3 mL/min, gradually adding boiling Purified Water until the Licorice is exhausted. Add enough diluted ammonia solution to the percolate to impart a distinctly ammoniacal odor, and boil the liquid actively under normal atmospheric pressure until it is reduced in volume to about 1500 mL. Filter the liquid, evaporate the filtrate on a steam bath until the residue measures 750 mL, cool, gradually add 250 mL of Alcohol and enough Purified Water to make the product measure 1000 mL, and mix.

OTHER COMPONENTS

- **ALCOHOL CONTENT, Method I** <611>: 20.0%–24.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived.

Linoleoyl Polyoxylglycerides

DEFINITION

Linoleoyl Polyoxylglycerides is a mixture of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols. The polyethylene glycols used have a mean molecular weight between 300 and 400. The article is produced by partial alcoholysis of unsaturated oils, mainly containing triglycerides of linoleic acid with polyethylene glycol, by esterification of glycerol and polyethylene glycol with fatty acids, or as a mixture of glycerol esters and ethylene oxide condensate with the fatty acids of the unsaturated oils. It may contain free polyethylene glycols.

IDENTIFICATION• **A. INFRARED ABSORPTION** (197F)• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

Standard solution: 50 mg/mL of USP Linoleoyl Polyoxylglycerides RS in methylene chloride

Sample solution: 50 mg/mL of Linoleoyl Polyoxylglycerides in methylene chloride

Application volume: 10 µL

Developing solvent system: Ether and hexanes (70:30)

Spray reagent: 0.1 mg/mL of rhodamine B in alcohol Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Then spray the plate with *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.

Acceptance criteria: The R_f values of the principal spots from the *Sample solution* correspond to those from the *Standard solution*.

• **C.** It meets the requirements in *Specific Tests* (see *Table 2*) for *Fats and Fixed Oils, Fatty Acid Composition* (401).**IMPURITIES**• **HEAVY METALS, Method II** (231): NMT 10 µg/g• **ARTICLES OF BOTANICAL ORIGIN, Total Ash** (561): NMT 0.1%• **ALKALINE IMPURITIES**

Sample: 5.0 g

Analysis: To the *Sample* add 10 mL of alcohol and 0.05 mL of bromophenol blue TS, and mix well. Titrate with 0.01 N hydrochloric acid VS to change the color to yellow.

Acceptance criteria: NMT 1.0 mL of 0.01 N hydrochloric acid is required.

• **LIMIT OF FREE ETHYLENE OXIDE AND DIOXANE**

[CAUTION—Ethylene oxide is toxic and flammable. Prepare all solutions in a well-ventilated hood. The operator must protect hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at 4°–8°.]

[NOTE—Perform all determinations three times.]

Magnesium chloride solution: 500 mg/mL of magnesium chloride in alcohol

Ethylene oxide stock solution: Into a dry, clean test tube, cooled in a mixture of sodium chloride and crushed ice (1:3), introduce a slow current of ethylene oxide gas, allowing condensation onto the inner wall of the test tube. Using a glass syringe, previously cooled to –10°, transfer 300 µL of liquid ethylene oxide, equivalent to 0.25 g, to 50 mL of polyethylene glycol 200. Determine the absorbed quantity of ethylene oxide by weighing before and after absorption. Dilute with polyethylene glycol 200 to 100.0 mL.

Standardize this solution by transferring 10.0 mL of *Magnesium chloride solution* and 20.0 mL of 0.1 M alcoholic hydrochloric acid VS to a volumetric flask. Insert the stopper, shake to obtain a saturated solution, and allow to equilibrate overnight. Transfer 5.00 mL of *Ethylene oxide stock solution* to the flask, and allow to stand for 30 min. Titrate with 0.1 M alcoholic potassium hydroxide VS. Perform a blank titration, using the same quantity of polyethylene glycol 200 instead of *Ethylene oxide stock solution*, and note the difference in volumes required. Each mL of the difference in volumes of 0.1 M alcoholic potassium hydroxide VS consumed is equivalent to 4.404 mg of ethylene oxide. Calculate the concentration of ethylene oxide in the *Ethylene oxide stock solution*.

Ethylene oxide solution: Prepare immediately before use. Dilute a volume of *Ethylene oxide stock solution* with polyethylene glycol 200 to obtain a solution containing about 50 µg/g of ethylene oxide. Dilute 1.0 mL of this solution with water to 5.0 mL to obtain a solution hav-

ing a known concentration of 10 µg/mL of ethylene oxide.

Dioxane solution: 0.5 mg/mL of dioxane

Standard solution A: Transfer 1.0 g of Linoleoyl Polyoxylglycerides to a 10-mL vial, and add 1.0 mL of *N,N*-dimethylacetamide, 0.1 mL of *Ethylene oxide solution*, and 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogeneous solution. Allow to stand at 90° for 45 min.

Standard solution B: Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL vial, add 0.1 mL of a freshly prepared 10 mg/L of acetaldehyde solution, and add 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogeneous solution.

Sample solution: Transfer 1.0 g of Linoleoyl Polyoxylglycerides to a 10-mL vial, and add 1.0 mL of *N,N*-dimethylacetamide and 0.2 mL of water. Close the vial, and mix to obtain a homogeneous solution. Allow to stand at 90° for 45 min.

Analysis

Samples: *Standard solution A* and *Sample solution*

Using a heated, gas-tight gas chromatographic syringe, separately inject equal volumes of the gaseous headspace of *Standard solution A* and of the *Sample solution* into the chromatograph, record the chromatograms, and measure the peak responses. **[NOTE—Adjust the sensitivity of the system so that the heights of the two principal peaks are NLT 15% of the full scale of the recorder.]**

Calculate the concentration of ethylene oxide in the sample taken:

$$\text{Result} = \{(C \times r_U) / [(r_S \times M_U) - (r_U \times M_S)]\}$$

C = concentration of ethylene oxide in *Standard solution A* (µg/mL)

r_U = peak response of ethylene oxide from the *Sample solution*

r_S = peak response of ethylene oxide from *Standard solution A*

M_U = quantity of Linoleoyl Polyoxylglycerides taken to prepare the *Sample solution* (g)
 M_S = quantity of Linoleoyl Polyoxylglycerides taken to prepare *Standard solution A* (g)
 Calculate the concentration of dioxane in the sample taken:

$$\text{Result} = C_D \times d_U/5 \times [(d_S \times M_U) - (d_U \times M_S)]$$

C_D = concentration of dioxane in *Standard solution A* ($\mu\text{g/mL}$)
 d_U = peak response of dioxane from the *Sample solution*
 d_S = peak response of dioxane from *Standard solution A*
 M_U = quantity of Linoleoyl Polyoxylglycerides taken to prepare the *Sample solution* (g)
 M_S = quantity of Linoleoyl Polyoxylglycerides taken to prepare *Standard solution A* (g)

Acceptance criteria

Ethylene oxide: NMT 1 $\mu\text{g/g}$; the peak area of ethylene oxide from the *Sample solution* is NMT half the corresponding peak area from *Standard solution A*.

Dioxane: NMT 10 $\mu\text{g/g}$; the peak area of dioxane from the *Sample solution* is NMT half the corresponding peak area from *Standard solution A*.

• LIMIT OF FREE GLYCEROL

Sample: 1.2 g

Periodic acetic acid solution: Dissolve 0.446 g of sodium periodate in 2.5 mL of a 25% (v/v) solution of sulfuric acid, diluting to 100.0 mL with glacial acetic acid.

Potassium iodide solution: 75 mg/mL of potassium iodide

Blank: 25 mL of methylene chloride

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 M sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 25 mL of methylene chloride, heating if necessary. Cool, and add 100 mL of water and 25.0 mL of *Periodic acetic acid solution*. Shake, and allow to stand for 30 min. Add 40 mL of *Potassium iodide solution*, and allow to stand for 1 min. Add 1 mL of starch TS, and titrate the liberated iodine with 0.1 M sodium thiosulfate VS. Perform a blank determination, and make any necessary correction.

Calculate the percentage of glycerol in the sample taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 23.0 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: NMT 5.0%

SPECIFIC TESTS

• FATS AND FIXED OILS, Acid Value <401>

Sample: 2.0 g

Acceptance criteria: NMT 2.0

• FATS AND FIXED OILS, Fatty Acid Composition <401>

Linoleoyl Polyoxylglycerides exhibits the composition profile of fatty acids shown in *Table 2*.

Table 2

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
16	0	4.0–20.0
18	0	≤6.0
18	1	20.0–35.0

Table 2 (Continued)

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
18	2	50.0–65.0
18	3	≤2.0
20	0	≤1.0
20	1	≤1.0

• FATS AND FIXED OILS, Hydroxyl Value <401>

Sample: 1.0 g

Acceptance criteria: 45–65

• FATS AND FIXED OILS, Iodine Value <401>

• FATS AND FIXED OILS, Peroxide Value <401>

Sample: 2.0 g

Acceptance criteria: NMT 12.0

• FATS AND FIXED OILS, Saponification Value <401>

Sample: 2.0 g

Acceptance criteria: 150–170

• WATER DETERMINATION, Method I <921>

Sample: 1.0 g

Analysis: Instead of using methanol as the solvent, one of two solvent systems can be used: a mixture of methylene chloride and anhydrous methanol (70:30 v/v), or anhydrous pyridine.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light and moisture. Store at controlled room temperature.

• **LABELING:** Label it to indicate the type and the average nominal molecular weight of polyethylene glycol used as part of the official title.

• USP REFERENCE STANDARDS <11>

USP Linoleoyl Polyoxylglycerides RS

Magnesium Aluminometasilicate

DEFINITION

Magnesium Aluminometasilicate is a synthetic material that exists in two forms, Type I-A and Type I-B, having different pH requirements. The required contents for both forms are the same: NLT 29.1% and NMT 35.5% of aluminum oxide (Al_2O_3), NLT 11.4% and NMT 14.0% of magnesium oxide (MgO), and NLT 29.2% and NMT 35.6% of silicon dioxide (SiO_2), calculated on the dried basis.

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, Aluminum <191>

Sample solution: Transfer 0.5 g of Magnesium Aluminometasilicate to a suitable container, add 5 mL of a sulfuric acid solution (1 in 3), and heat until white fumes are observed. Cool, add 20 mL of water, and filter. Neutralize the filtrate with ammonia TS, and retain for use in *Identification test B*. Collect the precipitate, and dissolve in 3 N hydrochloric acid.

Acceptance criteria: The *Sample solution* meets the requirements.

• B. IDENTIFICATION TESTS—GENERAL, Magnesium <191>

Sample solution: Use the filtrate retained from *Identification test A*.

Acceptance criteria: The *Sample solution* meets the requirements.

• C.

Analysis: Prepare a bead by fusing a few crystals of sodium ammonium phosphate on a platinum loop in the flame of a Bunsen burner. Place the hot, transparent bead in contact with Magnesium Aluminometasilicate, and again fuse.

Acceptance criteria: Silica floats about in the bead producing, upon cooling, an opaque bead with a web-like structure.

ASSAY

• ALUMINUM OXIDE

Edetate disodium titrant: Prepare a solution with a concentration of 18.6 g/L of edetate disodium in water and standardize as follows. Weigh 2 g of aluminum wire, transfer to a 1000-mL volumetric flask, and add 50 mL of a mixture of hydrochloric acid and water (1:1). Swirl the flask to ensure contact of the aluminum and the acid, and allow the reaction to proceed until all of the aluminum has dissolved. Dilute with water to volume. Pipet 10 mL of this solution into a 250-mL beaker and add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS, and boil gently for 5 min. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate with 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination, substituting 10 mL of water for the aluminum solution, and make any necessary correction. Calculate the molarity of the solution taken:

$$\text{Result} = W/(A_r \times V)$$

W = weight of aluminum in the portion of solution taken (mg)

A_r = atomic weight of aluminum, 26.98

V = volume of *Edetate disodium titrant* consumed (mL)

Sample solution: Transfer 1.25 g of Magnesium Aluminometasilicate to a conical flask, add 10 mL of 3 N hydrochloric acid and 50 mL of water, and heat on a water bath for 15 min. To this solution add 8 mL of hydrochloric acid, and heat on a water bath for 10 min. After cooling, transfer the solution to a 250-mL volumetric flask, rinse the conical flask with water, and add the washings to the volumetric flask. Dilute with water to volume. Centrifuge, and use the supernatant as the *Sample solution*. Retain a portion for use in the Assay for *Magnesium Oxide*.

Analysis: Transfer 20.0 mL of the *Sample solution* to a beaker and add 20.0 mL of *Edetate disodium titrant*. To this solution add 15 mL of acetic acid–ammonium acetate buffer TS and 20 mL of water, and boil for 5 min. After cooling, add 50 mL of alcohol and 2 mL of dithizone TS, and titrate with 0.05 M zinc sulfate VS until the color of the solution changes from green-violet to rose-pink. Perform a blank determination. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 2.5490 mg of Al_2O_3 .

Acceptance criteria: 29.1%–35.5% of aluminum oxide (Al_2O_3) on the dried basis

• MAGNESIUM OXIDE

Sample solution: Use the *Sample solution* prepared for use in the Assay for *Aluminum Oxide*.

Analysis: Transfer 50.0 mL of the *Sample solution* to a suitable container, add 50 mL of water and 25 mL of a triethanolamine solution (1 in 2), and shake well. Add 25 mL of ammonia–ammonium chloride buffer TS and 0.04 g of eriochrome black TS titration as the indicator. Titrate with 0.05 M edetate disodium VS until the red-purple color changes to blue and persists for 30 s. Each mL of 0.05 M edetate disodium VS is equivalent to 2.0152 mg of MgO.

Acceptance criteria: 11.4%–14.0% of magnesium oxide (MgO) on the dried basis

• SILICON DIOXIDE

Sample: 1 g

Analysis: To the *Sample* add 30 mL of 3 N hydrochloric acid, and evaporate on a water bath to dryness. Moisten the residue with hydrochloric acid, and

evaporate again on a water bath to dryness. To the residue add 8 mL of hydrochloric acid and 25 mL of hot water, and stir. Allow to stand, and then decant the supernatant through an ashless filter paper. To the residue in the container add 10 mL of hot water, stir, and decant the supernatant through the filter paper. Wash the residue in the container with three additional 10-mL portions of hot water, stir, and decant as described above. Treat the residue in the container with 50 mL of water, and heat on a water bath for 15 min. Filter, and rinse the residue on the filter paper with hot water until no precipitate is obtained when 1 mL of silver nitrate TS is added to 5 mL of the washing. Transfer the filter paper and its contents to a tared platinum crucible, heat to dryness, incinerate, and continue to heat at $800 \pm 25^\circ$ for 1 h. Cool, and weigh. Moisten the residue with 6 mL of hydrofluoric acid, evaporate to dryness, and ignite for 5 min. Cool, and weigh. The loss in weight represents the weight of silicon dioxide (SiO_2).

Acceptance criteria: 29.2%–35.6% of silicon dioxide (SiO_2) on the dried basis

IMPURITIES

• CHLORIDE AND SULFATE, *Chloride* (221)

Sample: A 20-mL portion of the diluted filtrate retained from the test for *Soluble Salts*

Control: 0.75 mL of 0.020 N hydrochloric acid

Acceptance criteria: NMT 0.053%; the *Sample* shows no more chloride than corresponds to the *Control*.

• CHLORIDE AND SULFATE, *Sulfate* (221)

Sample: A 2-mL portion of the diluted filtrate retained from the test for *Soluble Salts*

Control: 0.5 mL of 0.020 N sulfuric acid

Acceptance criteria: NMT 0.480%; the *Sample* shows no more sulfate than corresponds to the *Control*.

• ARSENIC, *Method I* (211): NMT 3 µg/g

• IRON (241)

Sample solution: To 0.11 g of Magnesium Aluminometasilicate add 8 mL of 2 N nitric acid, boil for 1 min, and cool. Dilute with water to 100 mL, and centrifuge. Dilute 30 mL of the supernatant with water to 45 mL.

Acceptance criteria: NMT 0.03%

• HEAVY METALS, *Method I* (231)

Test preparation: Transfer 2.67 g of Magnesium Aluminometasilicate to a suitable container, add 20 mL of water and 8 mL of hydrochloric acid, and evaporate to dryness on a water bath. To the residue add 5 mL of 1 N acetic acid and 20 mL of water, boil for 2 min, add 0.4 g of hydroxylamine hydrochloride, and heat to boiling. Cool, dilute with water to 100 mL, and filter. Use 25 mL of the filtrate as the *Test preparation*.

Monitor preparation: Transfer another 25 mL of the diluted filtrate to a suitable container, and add 2.0 mL of *Standard Lead Solution*.

Standard solution: Transfer 2 mL of hydrochloric acid to a suitable container, and evaporate to dryness on a water bath. To the residue add 2.0 mL of *Standard Lead Solution* and 0.1 g of hydroxylamine hydrochloride. Dilute with water to 25 mL.

Acceptance criteria: NMT 30 µg/g

SPECIFIC TESTS

• ACID-CONSUMING CAPACITY

Sample solution: Transfer 0.2 g of Magnesium Aluminometasilicate to a glass-stoppered flask, and add 100.0 mL of 0.1 N hydrochloric acid VS. Stopper the flask tightly, shake at $37 \pm 2^\circ$ for 1 h, and filter. Use the filtrate.

Analysis: Transfer 50.0 mL of the *Sample solution* to a beaker, and while stirring, titrate the excess hydrochloric acid with 0.1 N sodium hydroxide VS to attain a pH of 3.5. Perform a blank determination.

Acceptance criteria: NLT 210 mL of 0.1 N hydrochloric acid is consumed per g of Magnesium Aluminometasilicate, calculated on the dried basis.

• **pH** (791)

Sample: 2 g

Analysis: Add 50 mL of water to the *Sample*. While stirring, immerse the pH electrodes in the suspension, and after 2 min, record the pH.

Acceptance criteria

Type I-A: 6.5–8.5

Type I-B: 8.5–10.5

• **LOSS ON DRYING** (731)

Analysis: Dry at 110° for 7 h.

Acceptance criteria: NMT 20.0%

• **SOLUBLE SALTS**

Sample: 10.0 g

Analysis: Transfer the *Sample* to a suitable container, add 150 mL of water, and boil gently for 15 min, with shaking. After cooling, dilute with water to 150 mL, and centrifuge. Dilute 75 mL of the clear filtrate with water to 100 mL, and retain the diluted filtrate for use in the tests for *Alkalinity*, *Chloride*, and *Sulfate*. Evaporate 25 mL of the diluted filtrate on a water bath, and heat at 700° for 2 h.

Acceptance criteria: NMT 0.020 g (NMT 1.6%)

• **ALKALINITY**

Sample: A 20-mL portion of the diluted filtrate retained from the test for *Soluble Salts*

Analysis: Add 2 drops of phenolphthalein TS to the *Sample*.

Acceptance criteria: If a pink color is produced, NMT 0.50 mL of 0.1 N hydrochloric acid is required to discharge it.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and prevent exposure to excessive heat.
- **LABELING:** Label it to indicate whether it is Type I-A or Type I-B.

Magnesium Aluminosilicate

DEFINITION

Magnesium Aluminosilicate is a synthesized material that contains NLT 20.5% and NMT 27.7% of magnesium oxide (MgO), NLT 27.0% and NMT 34.3% of aluminum oxide (Al₂O₃), and NLT 14.4% and NMT 21.7% of silicon dioxide (SiO₂), calculated on the dried basis.

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL, Aluminum** (191)

Sample: 0.5 g

Analysis: Transfer the *Sample* to a suitable container, add 5 mL of a sulfuric acid solution (1 in 3), and heat until white fumes are observed. Cool, add 20 mL of water, and filter. Neutralize the filtrate with ammonia TS, and retain for use in *Identification test B*. Collect the precipitate, and dissolve in 3 N hydrochloric acid.

Acceptance criteria: Meets the requirements

• **B. IDENTIFICATION TESTS—GENERAL, Magnesium** (191)

Sample solution: The filtrate retained from *Identification test A*

Acceptance criteria: Meets the requirements

• **C.**

Analysis: Prepare a bead by fusing a few crystals of sodium ammonium phosphate on a platinum loop in the flame of a Bunsen burner. Place the hot, transparent bead in contact with Magnesium Aluminosilicate, and again fuse.

Acceptance criteria: The silica floats about in the bead, producing, upon cooling, an opaque bead with a web-like structure.

ASSAY

• **ALUMINUM OXIDE**

Edetate disodium titrant: Prepare a solution with a concentration of 18.6 g/L of edetate disodium in water, and standardize as follows. Weigh 2 g of aluminum wire, transfer to a 1000-mL volumetric flask, and add 50 mL of a mixture of hydrochloric acid and water (1:1). Swirl the flask to ensure contact of the aluminum and the acid, and allow the reaction to proceed until all the aluminum has dissolved. Dilute with water to volume. Pipet 10 mL of this solution into a 250-mL beaker, and add, in the order named and with continuous stirring, 25.0 mL of *Edetate disodium titrant* and 20 mL of acetic acid–ammonium acetate buffer TS. Boil gently for 5 min. Cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate with 0.05 M zinc sulfate VS to a bright rose-pink color. Perform a blank determination, substituting 10 mL of water for the aluminum solution, and make any necessary correction.

Calculate the molarity of the solution taken:

$$\text{Result} = W/(A_r \times V)$$

W = weight of aluminum in the portion of solution taken (g)

A_r = atomic weight of aluminum, 26.98 g/mol

V = volume of *Edetate disodium titrant* consumed (mL)

Sample solution: Transfer 1.25 g of Magnesium Aluminosilicate to a conical flask, add 10 mL of 3 N hydrochloric acid and 50 mL of water, and heat on a water bath for 15 min. To this solution add 8 mL of hydrochloric acid, and heat on a water bath for 10 min. After cooling, transfer the solution to a 250-mL volumetric flask, rinse the conical flask with water, and add the washings to the volumetric flask. Dilute with water to volume. Centrifuge, and use the supernatant as the *Sample solution*. [NOTE—Retain a portion of the *Sample solution* for use in the *Assay for Magnesium Oxide*.]

Blank: 10 mL of 3 N hydrochloric acid and 50 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: *Edetate disodium titrant*

Back-titrant: 0.05 M zinc sulfate VS

Endpoint detection: Visual

Analysis: Transfer 20.0 mL of the *Sample solution* to a beaker, and add 20.0 mL of *Titrant*. To this solution add 15 mL of acetic acid–ammonium acetate buffer TS and 20 mL of water, and boil for 5 min. After cooling, add 50 mL of alcohol and 2 mL of dithizone TS, and titrate with the *Back-titrant* until the color of the solution changes from green-violet to rose-pink. Perform a blank determination, and make the necessary correction. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 2.5490 mg of aluminum oxide (Al₂O₃).

Acceptance criteria: 27.0%–34.3% on the dried basis

• **MAGNESIUM OXIDE**

Sample solution: Use the portion retained from the *Sample solution* prepared in the *Assay for Aluminum Oxide*.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Endpoint detection: Visual

Analysis: Transfer 50.0 mL of the *Sample solution* to a suitable container, add 50 mL of water and 25 mL of a trolamine solution (500 mg/mL), and shake well. Add 25 mL of ammonia–ammonium chloride buffer TS and 0.04 g of eriochrome black TS trituration as the indicator. Titrate with *Titrant* until the red-purple color changes to blue and persists for 30 s. Each mL of 0.05

M edetate disodium VS is equivalent to 2.0152 mg of magnesium oxide (MgO).

Acceptance criteria: 20.5%–27.7% on the dried basis

• **SILICON DIOXIDE**

Sample: 1 g

Analysis: To the *Sample* add 30 mL of 3 N hydrochloric acid, and evaporate on a water bath to dryness. Moisten the residue with hydrochloric acid, and again evaporate on a water bath to dryness. To the residue add 8 mL of hydrochloric acid and 25 mL of hot water, and stir. Allow to stand, then decant the supernatant through an ashless filter paper. To the residue in the container add 10 mL of hot water, stir, and decant the supernatant through the filter paper. Wash the residue in the container with three additional 10-mL portions of hot water, stir, and decant as described above. Treat the residue in the container with 50 mL of water, and heat on a water bath for 15 min. Filter, and rinse the residue on the filter paper with hot water until no precipitate is obtained when 1 mL of silver nitrate TS is added to 5 mL of the washing. Transfer the filter paper and its contents to a tared platinum crucible, heat to dryness, incinerate, and continue to heat at $800 \pm 25^\circ$ for 1 h. Cool, and weigh. Moisten the residue with 6 mL of hydrofluoric acid, evaporate to dryness, and ignite for 5 min. Cool, and weigh. The loss in weight represents the weight of SiO_2 .

Acceptance criteria: 14.4%–21.7% on the dried basis

IMPURITIES

• **CHLORIDE AND SULFATE, Chloride** (221)

Analysis: A 20-mL portion of the diluted filtrate retained from the test for *Soluble Salts* shows no more chloride than corresponds to 0.75 mL of 0.020 N hydrochloric acid.

Acceptance criteria: NMT 0.053%

• **CHLORIDE AND SULFATE, Sulfate** (221)

Analysis: A 2-mL portion of the diluted filtrate retained from the test for *Soluble Salts* shows no more sulfate than corresponds to 0.5 mL of 0.020 N sulfuric acid.

Acceptance criteria: NMT 0.480%

• **ARSENIC, Method I** (211): NMT 3 µg/g

• **IRON** (241)

Sample: 0.11 g

Analysis: To the *Sample* add 8 mL of 2 N nitric acid, boil for 1 min, and cool. Dilute with water to 100 mL, and centrifuge. Dilute 30 mL of the supernatant with water to 45 mL.

Acceptance criteria: NMT 0.03%

• **HEAVY METALS, Method I** (231)

Standard preparation: Transfer 2 mL of hydrochloric acid to a suitable container, and evaporate to dryness on a water bath. To the residue add 2.0 mL of *Standard Lead Solution* and 0.1 g of hydroxylamine hydrochloride. Dilute with water to 25 mL.

Sample: 2.67 g

Test preparation: Transfer the *Sample* to a suitable container, add 20 mL of water and 8 mL of hydrochloric acid, and evaporate to dryness on a water bath. To the residue add 5 mL of 1 N acetic acid and 20 mL of water. Boil for 2 min, add 0.4 g of hydroxylamine hydrochloride, and heat to boiling. Cool, dilute with water to 100 mL, and filter. Use 25 mL of the filtrate as the *Test preparation*.

Monitor preparation: Transfer 25 mL of the filtrate from the *Test preparation* to a suitable container, and add 2.0 mL of *Standard Lead Solution*.

Acceptance criteria: NMT 30 µg/g

SPECIFIC TESTS

• **ACID-CONSUMING CAPACITY**

Sample solution: Transfer 0.2 g of Magnesium Aluminosilicate to a glass-stoppered flask, and add 100.0 mL of 0.1 N hydrochloric acid VS. Stopper the

flask tightly, shake at $37 \pm 2^\circ$ for 1 h, and filter. Use the filtrate.

Analysis: Transfer 50.0 mL of the filtrate from the *Sample solution* to a beaker, and while stirring, titrate the excess hydrochloric acid with 0.1 N sodium hydroxide VS to a pH of 3.5. Perform a blank determination, and make any necessary corrections.

Acceptance criteria: NLT 250 mL of 0.1 N hydrochloric acid is consumed per g of Magnesium Aluminosilicate, calculated on the dried basis.

• **pH** (791)

Sample: 2 g

Analysis: Add 50 mL of water to the *Sample*. While stirring, immerse the pH electrodes in the suspension, and after 2 min, record the pH.

Acceptance criteria: 8.5–10.5

• **LOSS ON DRYING** (731)

Analysis: Dry at 110° for 7 h.

Acceptance criteria: NMT 20.0%

• **SOLUBLE SALTS**

Sample: 10.0 g

Analysis: Transfer the *Sample* to a suitable container, add 150 mL of water, and boil gently for 15 min, with shaking. After cooling, dilute with water to 150 mL, and centrifuge. Dilute 75 mL of the clear filtrate with water to 100 mL, and retain the diluted filtrate for use in the tests for *Chloride*, *Sulfate*, and *Alkalinity*. Evaporate 25 mL of the diluted filtrate on a water bath, and heat at 700° for 2 h.

Acceptance criteria: NMT 1.6%; the residue weighs NMT 0.020 g.

• **ALKALINITY**

Sample: 20 mL of diluted filtrate retained from the test for *Soluble Salts*

Analysis: Add 2 drops of phenolphthalein TS to the *Sample*, containing 1 g of Magnesium Aluminosilicate.

Acceptance criteria: If a pink color is produced, NMT 0.50 mL of 0.1 N hydrochloric acid is required to discharge it.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and prevent exposure to excessive heat.

Magnesium Aluminum Silicate

DEFINITION

Magnesium Aluminum Silicate is a blend of colloidal montmorillonite and saponite that has been processed to remove grit and nonswellable ore components. The requirements for viscosity and ratio of aluminum content to magnesium content differ for the several types of Magnesium Aluminum Silicate, as set forth in the table below.

Type	Viscosity (cps)		Al content/ Mg content	
	Min.	Max.	Min.	Max.
IA	225	600	0.5	1.2
IB	150	450	0.5	1.2
IC	800	2200	0.5	1.2
IIA	100	300	1.4	2.8

IDENTIFICATION

• **A.**

Sample: 2 g

Analysis 1: Add the *Sample* in small portions to 100 mL of water with intense agitation. Allow to stand for 12 h to ensure complete hydration. Place 2 mL of the resulting mixture on a suitable glass slide, and allow to air-

dry at room temperature to produce an oriented film. Place the slide in a vacuum desiccator over a free surface of ethylene glycol. Evacuate the desiccator, and close the stopcock so that the ethylene glycol saturates the desiccator chamber. Allow to stand for 12 h. Record the X-ray diffraction pattern (see *X-Ray Diffraction* (941)), and calculate the d values.

Acceptance criteria 1: The largest peak corresponds to a d value between 15.0 and 17.2 Å.

Analysis 2: Prepare a random powder specimen of Magnesium Aluminum Silicate, record the X-ray diffraction pattern, and determine the d values in the region between 1.48 and 1.54 Å.

Acceptance criteria 2: Peaks are found at 1.492–1.504 Å and at 1.510–1.540 Å.

ASSAY

• ALUMINUM CONTENT AND MAGNESIUM CONTENT

Aluminum content

Aluminum standard stock solution: Dissolve 1.000 g of aluminum in a mixture of 10 mL of hydrochloric acid and 10 mL of water by gentle heating. Transfer the solution to a 1000-mL volumetric flask, and dilute with water to volume. This solution contains the equivalent of 1 mg/mL of aluminum.

Aluminum standard solutions: Transfer 2-, 5-, and 10-mL aliquots of the *Aluminum standard stock solution* to separate 100-mL volumetric flasks containing 200 mg of sodium chloride, and dilute each with water to volume.

Sample stock solution: Transfer 0.200 g of Magnesium Aluminum Silicate to a 25-mL platinum crucible containing 1.0 g of lithium metaborate, and mix. Using a muffle furnace or a suitable burner, heat slowly at first, and ignite at 1000°–1200° for 15 min. Cool, place the crucible in a 100-mL beaker containing 25 mL of dilute nitric acid (50 mg/mL), and add an additional 50 mL of the dilute acid, filling and submerging the upright crucible. Place a polyfluorocarbon-coated magnetic stirring bar into the crucible, and stir gently with a magnetic stirrer to dissolve. Pour the contents into a 250-mL beaker, and remove the crucible. Warm the solution, transfer through a rapid-flow filter paper with the aid of water into a 200-mL volumetric flask, and dilute with water to volume.

Sample solution: Pipet 20 mL of the *Sample stock solution* into a 100-mL volumetric flask. Add 20 mL of a solution of sodium chloride (10 mg/mL), and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a single-slot burner

Analytical wavelength: 309 nm

Lamp: Aluminum hollow-cathode

Flame: Oxidizing acetylene–air–nitrous oxide

Analysis

Samples: *Aluminum standard solutions* and *Sample solution*

Determine the absorbances of the *Aluminum standard solutions* and the *Sample solution*. From a linear regression equation calculated from the absorbances and concentrations of the *Aluminum standard solutions*, determine the aluminum content of the magnesium aluminum silicate.

Magnesium content

Lanthanum solution: Stir 88.30 g of lanthanum chloride (LaCl_3) with 500 mL of 6 N hydrochloric acid to dissolve, transfer with the aid of water to a 1000-mL volumetric flask, and dilute with water to volume.

Magnesium standard stock solution: Place 1.000 g of magnesium in a 250-mL beaker containing 20 mL of water, and carefully add 20 mL of hydrochloric acid, warming, if necessary, to complete the reaction. Transfer the solution to a 1000-mL volumetric flask, and

dilute with water to volume. This solution contains the equivalent of 1 mg/mL of magnesium. Transfer 10.0 mL of this solution to a 1000-mL volumetric flask, and dilute with water to volume.

Magnesium standard solutions: Transfer 5-, 10-, 15-, and 20-mL aliquots of the *Magnesium standard stock solution* to separate 100-mL volumetric flasks. To each flask, add 20.0 mL of *Lanthanum solution*, and dilute with water to volume.

Sample stock solution: Use the *Sample stock solution* prepared as directed for *Aluminum content*.

Sample solution: Transfer 25 mL of the *Sample stock solution* to a 50-mL volumetric flask, and dilute with water to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 20.0 mL of *Lanthanum solution*, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption

Analytical wavelength: 285 nm

Lamp: Magnesium hollow-cathode

Flame: Reducing flame of acetylene–air

Analysis

Samples: *Magnesium standard solutions* and *Sample solution*

Determine the absorbances of the *Sample solution* and the *Magnesium standard solutions*. From a linear regression equation calculated from the absorbances and concentrations of the *Magnesium standard solutions*, determine the magnesium content in the magnesium aluminum silicate.

Ratio of aluminum content to magnesium content

Analysis: Using the results from the *Aluminum content* and the *Magnesium content*, determine the ratio of aluminum content to magnesium content.

Acceptance criteria

Type IA: 0.5–1.2

Type IB: 0.5–1.2

Type IC: 0.5–1.2

Type IIA: 1.4–2.8

IMPURITIES

• ARSENIC, Method I (211)

Standard preparation: Prepare as directed in the chapter.

Control preparation: Transfer 5.0 mL (5 µg of As) of the *Standard preparation* to a 25-mL volumetric flask, and add dilute hydrochloric acid (1:25) to volume.

Test preparation: Transfer 13.3 g of Magnesium Aluminum Silicate to a 250-mL beaker containing 100 mL of dilute hydrochloric acid (1:25), mix, cover with a watch glass, and boil gently, with occasional stirring, for 15 min without allowing excessive foaming. Allow the insoluble material to settle, and decant the hot supernatant through a rapid-flow filter paper into a 200-mL volumetric flask, retaining as much sediment as possible in the beaker. Add 25 mL of hot dilute hydrochloric acid (1:25) to the residue in the beaker, stir, and heat to boiling. Allow the insoluble material to settle, and decant the supernatant through the filter into the 200-mL volumetric flask. Repeat the extraction with four additional 25-mL portions of hot dilute hydrochloric acid (1:25), decanting each hot supernatant through the filter into the volumetric flask. At the last extraction, transfer as much of the insoluble material as possible onto the filter. Cool the combined filtrates to room temperature, add dilute hydrochloric acid (1:25) to volume, and mix. Use 25 mL for the test.

Acceptance criteria: NMT 3 µg/g; the absorbance due to any red color from the *Test preparation* does not exceed that produced by the *Control preparation*.

• LEAD

Standard preparation: On the day of use, dilute 3.0 mL of *Lead Nitrate Stock Solution* (see *Heavy Metals*

(231)) with water to 100 mL. Each mL contains the equivalent of 3 µg of lead.

Sample: 10.0 g

Test preparation: Transfer the *Sample* to a 250-mL beaker containing 100 mL of dilute hydrochloric acid (1:25), stir, cover with a watch glass, and boil for 15 min. Cool to room temperature, and allow the insoluble matter to settle. Decant the supernatant through a rapid-flow filter paper into a 400-mL beaker. Add 25 mL of hot water to the insoluble matter in the 250-mL beaker, and stir. Allow the insoluble matter to settle, and decant the supernatant through the filter into the 400-mL beaker. Repeat the extraction with two additional 25-mL portions of water, decanting each supernatant portion through the filter into the 400-mL beaker. Wash the filter with 25 mL of hot water, collecting this filtrate in the 400-mL beaker. Concentrate the combined extracts by gentle boiling to approximately 20 mL. If a precipitate appears, add 2 to 3 drops of nitric acid, heat to boiling, and cool to room temperature. Filter the concentrated extracts through a rapid-flow filter paper into a 50-mL volumetric flask. Transfer the remaining contents of the 400-mL beaker through the filter paper and into the flask with water. Dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a deuterium arc background correction and a single-slot burner

Analytical wavelength: 284 nm

Lamp: Lead hollow-cathode

Flame: Oxidizing flame of air and acetylene

Acceptance criteria: 15 µg/g; the absorbance of the *Test preparation* is NMT that of the *Standard preparation*.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): Its total aerobic microbial count does not exceed 10^3 cfu/g, and it meets the requirements of the test for absence of *Escherichia coli*.

- **pH** (791)

Sample suspension: 50 mg/mL

Acceptance criteria: 9.0–10.0

- **LOSS ON DRYING** (731)

Analysis: Dry a sample at 110° to constant weight.

Acceptance criteria: NMT 8.0%

- **VISCOSITY**

Sample solution: After determining the *Loss on Drying*, weigh a quantity of Magnesium Aluminum Silicate, equivalent to 25.0 g on the dried basis. Over a period of a few s, transfer the undried test specimen to a suitable 1-L blender jar containing an amount of water, maintained at a temperature of $25 \pm 2^\circ$, that is sufficient to produce a mixture weighing 500 g. Blend for 3 min, accurately timed, at 14,000–15,000 rpm (high speed). [NOTE—Heat generated during blending causes a temperature rise to above 30° .]

Analysis: Transfer the contents of the blender to a 600-mL beaker, allow to stand for 5 min, and adjust, if necessary, to a temperature of $33 \pm 3^\circ$. Using a suitable rotational viscometer equipped with a spindle as specified below, operate the viscometer at 60 rpm for 6 min, accurately timed, and record the scale reading.

For Type IA, use a spindle having a cylinder 1.87 cm in diameter and 0.69 cm high attached to a shaft 0.32 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 2.54 cm, and the immersion depth being 5.00 cm (No. 2 spindle). If the scale reading is greater than 90% of full scale, repeat the measurement, using a spindle similar to the No. 2 spindle but having the cylinder 1.27 cm in diameter and 0.16 cm high instead (No. 3 spindle).

For Type IC, use a No. 3 spindle. If the scale reading is greater than 90% of full scale, repeat the measurement using a spindle consisting of a cylindrical shaft 0.32 cm in diameter and having an immersion depth of 4.05 cm (No. 4 spindle).

For Types IB and IIA, use a No. 2 spindle.

Acceptance criteria

Type IA: 225–600

Type IB: 150–450

Type IC: 800–2200

Type IIA: 100–300

- **ACID DEMAND**

Sample: After determining the *Loss on Drying*, weigh a quantity of Magnesium Aluminum Silicate equivalent to 5.00 g.

Analysis: Disperse the *Sample* in 500 mL of water with the aid of a suitable blender fitted with a 1-L jar. Using a stopwatch, designate zero time. With constant mixing, add 3.0-mL portions of 0.100 N hydrochloric acid at 5, 65, 125, 185, 245, 305, 365, 425, 485, 545, 605, 665, and 725 s, and add a 1.0-mL portion at 785 s.

Determine the pH potentiometrically at 840 s.

Acceptance criteria: NMT 4.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate its type.

Magnesium Silicate

DEFINITION

Magnesium Silicate is a compound of magnesium oxide and silicon dioxide. It contains NLT 15.0% of magnesium oxide (MgO) and NLT 67.0% of silicon dioxide (SiO₂), calculated on the ignited basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Magnesium** (191)

Sample: 500 mg

Analysis: Mix the *Sample* with 10 mL of 3 N hydrochloric acid. Filter, and neutralize the filtrate to litmus paper with 6 N ammonium hydroxide.

Acceptance criteria: The neutralized filtrate meets the requirements.

- **B.**

Analysis: Prepare a bead by fusing a few crystals of sodium ammonium phosphate on a platinum loop in the flame of a Bunsen burner. Place the hot, transparent bead in contact with Magnesium Silicate, and again fuse.

Acceptance criteria: Silica floats about in the bead, producing, upon cooling, an opaque bead with a web-like structure.

ASSAY

- **MAGNESIUM OXIDE**

Sample: 1.5 g

Titrimetric system

Mode: Residual titration

Titrant: 1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 50.0 mL of 1 N sulfuric acid VS. Digest on a steam bath for 1 h, cool to room temperature, and add methyl orange TS. Titrate the excess acid in the sample with *Titrant*. Each mL of 1 N sulfuric acid is equivalent to 20.15 mg of MgO.

Acceptance criteria: NLT 15.0% on the ignited basis

- **SILICON DIOXIDE**

Sample: 700 mg

Analysis: Transfer the *Sample* to a small platinum dish. Add 10 mL of 1 N sulfuric acid, and heat on a steam bath to dryness, leaving the dish uncovered. Treat the

residue with 25 mL of water, and digest on a steam bath for 15 min. Decant the supernatant through an ashless filter paper, with the aid of suction, and wash the residue, by decantation, three times with hot water, passing the washings through the filter paper. Finally, transfer the residue to the filter, and wash thoroughly with hot water. Transfer the filter paper and its contents to the platinum dish previously used. Heat to dryness, incinerate, ignite strongly for 30 min, cool, and weigh. Moisten the residue with water, and add 6 mL of hydrofluoric acid and 3 drops of sulfuric acid. Evaporate to dryness, ignite for 5 min, cool, and weigh. The loss in weight represents the weight of SiO_2 .

Acceptance criteria: NLT 67.0% on the ignited basis

IMPURITIES

• FLUORIDE

Indicator solution: 100 mg/mL of lanthanum alizarin complexan mixture in 60% isopropyl alcohol. Filter the solution if it is not clear.

Standard solution: 2.21 $\mu\text{g/mL}$ of sodium fluoride in 0.1 N hydrochloric acid

Sample solution: Prepare a slurry consisting of 5.0 g of Magnesium Silicate and 45 mL of 0.1 N hydrochloric acid. Stir at room temperature for 15 min, and pass through a filter of 0.45- μm pore size into a 50-mL volumetric flask. Wash the filter with five 1-mL portions of 0.1 N hydrochloric acid, collecting the washings in the flask. Dilute with 0.1 N hydrochloric acid to volume.

Instrumental conditions

Mode: Vis

Analytical wavelength: About 620 nm

Cell: 1 cm

Blank: 0.1 N hydrochloric acid, *Indicator solution*, and water (5:5:15)

Analysis: Transfer 5.0 mL of the *Standard solution* and *Sample solution* to separate 25-mL volumetric flasks, add 5.0 mL of *Indicator solution*, dilute with water to volume, and allow to stand for 1 h in diffuse light at ambient temperature. Determine the absorbance of the solutions against the *Blank*.

Acceptance criteria: 10 $\mu\text{g/g}$; the absorbance of the *Sample solution* is NMT than that of the *Standard solution*.

• SOLUBLE SALTS

Sample: 10.0 g

Analysis: Boil the *Sample* with 150 mL of water for 15 min. Cool to room temperature, and allow the mixture to stand for 15 min. Filter with the aid of suction, transfer the filtrate to a 200-mL volumetric flask, and dilute with water to volume. Evaporate 50.0 mL of this solution, representing 2.5 g of the Silicate, in a tared platinum dish to dryness. Ignite gently to constant weight. Retain the remaining diluted solution for the test for *Free Alkali*.

Acceptance criteria: 3.0%; NMT 75.0 mg

• FREE ALKALI

Sample: 20 mL of the retained diluted filtrate prepared in the test for *Soluble Salts*

Analysis: Add 2 drops of phenolphthalein TS to the *Sample*, representing 1 g of Magnesium Silicate.

Acceptance criteria: If a pink color is produced, NMT 2.5 mL of 0.1 N hydrochloric acid is required to discharge it.

• HEAVY METALS (231)

Solution A: Hydrochloric acid in water (1 in 100)

Test preparation: Boil 4.0 g of Magnesium Silicate with a mixture of 50 mL of water and 10 mL of hydrochloric acid for 20 min, and add water to maintain the volume during the boiling. Add ammonium hydroxide until the mixture is only slightly acid to litmus paper. Filter with the aid of suction, and wash with 15–20 mL of water, combining the washings with the original filtrate. Add 2 drops of phenolphthalein TS, then add a slight excess of 6 N ammonium hydroxide. Discharge the pink color

with *Solution A*, then add 8 mL of *Solution A*. Dilute with water to 100 mL, and use 25 mL of the solution for the test.

Acceptance criteria: NMT 20 $\mu\text{g/g}$

• LEAD (251)

Test preparation: Dissolve 1.0 g of Magnesium Silicate in 20 mL of 3 N hydrochloric acid, evaporate on a steam bath to 10 mL, dilute with water to 20 mL, and cool.

Acceptance criteria: NMT 10 $\mu\text{g/g}$

SPECIFIC TESTS

• RATIO OF SiO_2 TO MgO

Analysis: Divide the percentage of SiO_2 obtained in the *Assay for Silicon Dioxide* by the percentage of MgO obtained in the *Assay for Magnesium Oxide*.

Acceptance criteria: 2.50–4.50

• LOSS ON DRYING (731) [NOTE—Retain the dried specimen for the test for *Loss on Ignition*.]

Analysis: Dry at 105° for 2 h.

Acceptance criteria: NMT 15.0%

• LOSS ON IGNITION (733)

Sample: The specimen retained from the test for *Loss on Drying*

Analysis: Ignite the *Sample* at 900°–1000° for 20 min.

Acceptance criteria: NMT 15%, previously dried

• PH (791)

Sample solution: A well-mixed aqueous suspension (1 in 10)

Acceptance criteria: 7.0–10.8

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Magnesium Stearate

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

Octadecanoic acid, magnesium salt;
Magnesium stearate [557-04-0].

DEFINITION

Magnesium Stearate is a compound of magnesium with a mixture of solid organic acids, and consists chiefly of variable proportions of magnesium stearate and magnesium palmitate. The fatty acids are derived from edible sources. It contains NLT 4.0% and NMT 5.0% of Mg, calculated on the dried basis.

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, *Magnesium* (191)

Sample solution: Mix 5.0 g with 50 mL of peroxide-free ether, 20 mL of diluted nitric acid, and 20 mL of water in a round-bottom flask. Connect the flask to a reflux condenser, and reflux until dissolution is complete. Allow to cool, and transfer the contents of the flask to a separator. Shake, allow the layers to separate, and transfer the aqueous layer to a flask. Extract the ether layer with two 4-mL portions of water, and add these aqueous extracts to the main aqueous extract. Wash the aqueous extract with 15 mL of peroxide-free ether, transfer the aqueous extract to a 50-mL volumetric flask, and dilute with water to volume. Retain the unused portion of this solution for the chloride and sulfate impurity tests.

Acceptance criteria: The *Sample solution* meets the requirements.

- **B.** The retention times of the peaks corresponding to stearic acid and palmitic acid of the *Sample solution* correspond to those of the *System suitability solution*, as ob-

tained in the test for *Relative Content of Stearic Acid and Palmitic Acid*.

ASSAY

• PROCEDURE

Buffer: Dissolve 5.4 g of ammonium chloride in water, add 20 mL of ammonium hydroxide, and dilute with water to 100 mL.

Sample: 500 mg

Analysis: To the *Sample* add 50 mL of a mixture of butyl alcohol and dehydrated alcohol (1:1), 5 mL of ammonium hydroxide, 3 mL of *Buffer*, 30.0 mL of 0.1 M edetate disodium VS, and 1 or 2 drops of eriochrome black TS. Heat at 45°–50° until the solution is clear. Cool, and titrate the excess edetate disodium with 0.1 M zinc sulfate VS until the solution color changes from blue to violet (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 M edetate disodium is equivalent to 2.431 mg of Mg.

Acceptance criteria: 4.0%–5.0% on the dried basis

IMPURITIES

- **CHLORIDE AND SULFATE, Chloride (221):** A 10.0-mL portion of the *Sample solution* prepared in *Identification test A* shows no more chloride than corresponds to 1.4 mL of 0.020 N hydrochloric acid (0.1%).
- **CHLORIDE AND SULFATE, Sulfate (221):** A 6.0-mL portion of the *Sample solution* prepared in *Identification test A* shows no more sulfate than corresponds to 3.0 mL of 0.020 N sulfuric acid (1.0%).

• LIMIT OF CADMIUM

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of cadmium, lead, and nickel as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 min, and rinse with deionized water.]

Matrix modifier solution: Prepare a solution containing 200 mg/mL of monobasic ammonium phosphate and 10 mg/mL of magnesium nitrate. Alternatively, use an appropriate matrix modifier as recommended by the manufacturer of the graphite furnace atomic absorption (GFAA) spectrophotometer.

Blank: Nitric acid in water (1 in 4)

Standard solution: 0.00825 µg/mL of cadmium nitrate tetrahydrate in *Blank*, corresponding to a known concentration of 0.0030 µg/mL of cadmium

Sample stock solution: Transfer 0.100 g of Magnesium Stearate to a suitable polytetrafluoroethylene (PTFE)-lined acid-digestion bomb, and add 2.5 mL of nitric acid. Close and seal the bomb according to the manufacturer's operating instructions. [CAUTION—When using an acid-digestion bomb, be thoroughly familiar with the safety and operating instructions. Carefully follow the bomb manufacturer's instructions regarding care and maintenance of these acid-digestion bombs. Do not use metal-jacketed bombs or liners that have been used with hydrochloric acid because of contamination from corrosion of the metal jacket by hydrochloric acid.] Heat the bomb in an oven at 170° for 3 h. Air cool the bomb slowly to room temperature as per the bomb manufacturer's instructions. Place the bomb in a hood, and open carefully because corrosive gases may be expelled. Dilute the residue with water to 10.0 mL in a volumetric flask.

Sample solutions: Dilute the *Sample stock solution* with *Blank* (1 in 10). Prepare mixtures of this solution, the *Standard solution*, and the *Blank* with the following proportional compositions, by volume (mL): 1.0/0/1.0, 1.0/0.5/0.5, and 1.0/1.0/0. Add 50 µL of *Matrix modifier solution* to each mixture. These *Sample solutions* con-

tain, respectively, 0, 0.00075, and 0.0015 µg/mL of cadmium from the *Standard solution*. [NOTE—Retain the remaining *Sample stock solution* for use in the tests for *Limit of Lead* and *Limit of Nickel*.]

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry (using a suitable GFAA spectrophotometer equipped with a pyrolytic tube with platform)

Analytical wavelength: Cadmium emission line at 228.8 nm

Lamp: Cadmium hollow-cathode

Temperature: Use the temperature programming recommended for cadmium by the GFAA manufacturer (for examples of temperature parameters for GFAA analysis of cadmium, see *Table 1*).

Table 1

	Drying Stage	Ashing Stage	Atomization Stage
Temperature	110°	600°	1800°
Ramp time	10 s	10 s	0 s
Hold time	20 s	30 s	5 s

Analysis: Use the *Blank* to set the instrument to zero.

Plot the absorbances of the *Sample solutions* versus their contents of cadmium, in µg/mL, as furnished by the *Standard solution*, draw the straight line best fitting the three points, using a linear least-squares fit, and extrapolate the line until it intercepts the concentration axis on the negative side. From the intercept determine the concentration, C, in µg/mL, of cadmium in the *Sample solution* containing 0 mL of the *Standard solution*. Calculate the content, in ppm, of cadmium in the specimen taken:

$$\text{Result} = (C/W) \times F$$

W = weight of Magnesium Stearate taken to prepare the *Sample stock solution* (g)

F = dilution factor for the sample, 200

Alternatively, the GFAA software can be used to calculate the cadmium content of the sample. For either calculation, the correlation coefficient (r) of the standard additions plot must be at least 0.995.

Acceptance criteria: 3 ppm

• LIMIT OF LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of cadmium, lead, and nickel as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 min, and rinse with deionized water.]

Matrix modifier solution: Prepare as directed for *Matrix modifier solution* in *Limit of Cadmium*.

Blank: Prepare as directed for *Blank* in *Limit of Cadmium*.

Standard solution: 0.1598 µg/mL of lead nitrate in *Blank*, corresponding to a known concentration of 0.100 µg/mL of lead. Prepare and store any solutions of lead nitrate in glass containers free from soluble lead salts.

Sample stock solution: Use a portion of the *Sample stock solution* retained from the test for *Limit of Cadmium*.

Sample solutions: Prepare mixtures of the *Sample stock solution*, the *Standard solution*, and the *Blank* with the following proportional compositions, by volume (mL): 1.0/0/1.0, 1.0/0.5/0.5, and 1.0/1.0/0. Add 50 µL of the *Matrix modifier solution* to each mixture. These *Sample*

solutions contain, respectively, 0, 0.025, and 0.05 µg/mL of lead from the *Standard solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry (using a suitable GFAA spectrophotometer equipped with a pyrolytic tube with platform)

Analytical wavelength: Lead emission line at 283.3 nm

Lamp: Lead hollow-cathode

Temperature: Use the temperature programming recommended for lead by the GFAA manufacturer (for examples of temperature parameters for GFAA analysis of lead, see *Table 1*).

Analysis: Use the *Blank* to set the instrument to zero. Plot the absorbances of the *Sample solutions* versus their contents of lead, in µg/mL, as furnished by the *Standard solution*, draw the straight line best fitting the three points, using a linear least-squares fit, and extrapolate the line until it intercepts the concentration axis on the negative side. From the intercept determine the concentration, *C*, in µg/mL, of lead in the *Sample solution* containing 0 mL of the *Standard solution*. Calculate the content, in ppm, of lead in the specimen taken:

$$\text{Result} = (C/W) \times F$$

W = weight of Magnesium Stearate taken to prepare the *Sample stock solution* (g)

F = dilution factor for the sample, 20

Alternatively, the GFAA software can be used to calculate the lead content of the sample. For either calculation, the correlation coefficient (*r*) of the standard additions plot must be at least 0.995.

Acceptance criteria: 10 ppm

• LIMIT OF NICKEL

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of cadmium, lead, and nickel as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 min, and rinse with deionized water.]

Matrix modifier solution: Prepare as directed for *Matrix modifier solution* in *Limit of Cadmium*.

Blank: Prepare as directed for *Blank* in *Limit of Cadmium*.

Standard solution: 0.2477 µg/mL of nickel nitrate hexahydrate in *Blank*, corresponding to a known concentration of 0.050 µg/mL of nickel

Sample stock solution: Use a portion of the *Sample stock solution* retained from the test for *Limit of Cadmium*.

Sample solutions: Prepare mixtures of the *Sample stock solution*, the *Standard solution*, and the *Blank* with the following proportional compositions, by volume (mL): 1.0/0/1.0, 1.0/0.5/0.5, and 1.0/1.0/0. Add 50 µL of the *Matrix modifier solution* to each mixture. These *Sample solutions* contain, respectively, 0, 0.0125, and 0.025 µg/mL of nickel from the *Standard solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry (using a suitable GFAA spectrophotometer equipped with a pyrolytic tube with platform)

Analytical wavelength: Nickel emission line at 232.0 nm

Lamp: Nickel hollow-cathode

Temperature: Use the temperature programming recommended for nickel by the GFAA manufacturer (for examples of temperature parameters for GFAA analysis of nickel, see *Table 1*).

Analysis: Use the *Blank* to set the instrument to zero.

Plot the absorbances of the *Sample solutions* versus their contents of nickel, in µg/mL, as furnished by the *Standard solution*, draw the straight line best fitting the three points, using a linear least-squares fit, and extrapolate the line until it intercepts the concentration axis on the negative side. From the intercept determine the concentration, *C*, in µg/mL, of nickel in the *Sample solution* containing 0 mL of the *Standard solution*.

Calculate the content, in ppm, of nickel in the specimen taken:

$$\text{Result} = (C/W) \times F$$

W = weight of Magnesium Stearate taken to prepare the *Sample stock solution* (g)

F = dilution factor for the sample, 20

Alternatively, the GFAA software can be used to calculate the nickel content of the sample. For either calculation, the correlation coefficient (*r*) of the standard additions plot must be at least 0.995.

Acceptance criteria: 5 ppm

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10^3 cfu/g, the total combined molds and yeasts count does not exceed 5×10^2 cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

• ACIDITY OR ALKALINITY

Sample solution: To 1.0 g add 20 mL of carbon dioxide-free water, boil on a steam bath for 1 min with continuous shaking, cool, and filter. Add 0.05 mL of bromothymol blue TS to 10 mL of the filtrate.

Acceptance criteria: NMT 0.05 mL of 0.1 N hydrochloric acid or 0.1 N sodium hydroxide is required to change the color of the indicator.

• SPECIFIC SURFACE AREA (846)

[NOTE—In cases where there are no functionality-related concerns regarding the specific surface area of this article, this test may be omitted.]

Where the labeling states the specific surface area, determine the specific surface area value as directed in the chapter in the *P/P₀* range of 0.05–0.15, and using outgassing conditions of 2 h at 40°. If the plot deviates from linearity for *P/P₀* values of 0.05–0.15, then a suitable range of *P/P₀* values should be validated for linearity. In this case, it is necessary to state the range of validated *P/P₀* values, the increment of the *P/P₀* values, and the outgassing conditions used.♦

• **LOSS ON DRYING (731):** Dry a sample at 105° to constant weight: it loses NMT 6.0% of its weight.

• RELATIVE CONTENT OF STEARIC ACID AND PALMITIC ACID

System suitability solution: Transfer 50 mg each of USP Stearic Acid RS and USP Palmitic Acid RS to a small conical flask fitted with a suitable reflux condenser. Add 5.0 mL of a solution prepared by dissolving 14 g of boron trifluoride in methanol to make 100 mL, swirl to mix, and reflux for 10 min until the solids have dissolved. Add 4 mL of chromatographic *n*-heptane through the condenser, and reflux for 10 min. Cool, add 20 mL of saturated sodium chloride solution, shake, and allow the layers to separate. Pass the *n*-heptane layer through 0.1 g of anhydrous sodium sulfate (previously washed with chromatographic *n*-heptane) into a suitable flask. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, and dilute with chromatographic *n*-heptane to volume.

Sample solution: Transfer 100 mg of Magnesium Stearate to a small conical flask fitted with a suitable reflux condenser, and proceed as directed for *System suitability solution*, beginning with "Add 5.0 mL of a solution prepared by dissolving".

Chromatographic system(See *Chromatography* <621>, *System Suitability*.)**Mode:** GC**Detector:** Flame ionization**Column:** 0.32-mm × 30-m fused silica capillary column, bonded with a 0.5-μm layer of phase G16**Temperature****Injector:** 220°**Detector:** 260°**Column:** See *Table 2*.**Table 2**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	2
70	5	240	5

Carrier gas: Helium**Flow rate:** 2.4 mL/min**Injection size:** 1 μL**Injection type:** Splitless injection system**System suitability****Sample:** *System suitability solution*

[NOTE—The relative retention times for methyl palmitate and methyl stearate are about 0.9 and 1.0, respectively.]

Suitability requirements**Resolution:** NLT 5.0 between methyl palmitate and methyl stearate**Relative standard deviation:** NMT 3.0% for the palmitate and stearate peak areas from six replicate injections and NMT 1.0% for the peak area ratio of palmitate to stearate from six replicate injections**Analysis****Sample:** *Sample solution*

Measure the peak areas for all the fatty acid esters in the chromatogram.

Calculate the percentage of stearic acid in the fatty acid fraction of the portion of Magnesium Stearate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

 r_U = peak area due to methyl stearate r_T = sum of the peak areas of all the fatty acid esters

Similarly, calculate the percentage of palmitic acid in the portion of Magnesium Stearate taken.

$$\text{Result} = (r_P/r_T) \times 100$$

 r_P = peak area due to methyl palmitate r_T = sum of the areas of all the fatty acid ester peaks**Acceptance criteria:** NLT 40% for the stearate peak.

The sum of the stearate and palmitate peaks is NLT 90% of the total peak areas of all the fatty acids.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **•LABELING:** Where the labeling states the specific surface area, it also indicates which method specified in *Specific Surface Area* <846> is used. Label to indicate that the fatty acids are derived from edible sources.♦
- **USP REFERENCE STANDARDS** <11>
 - USP Palmitic Acid RS
 - USP Stearic Acid RS

Maleic Acid $C_4H_4O_4$

(Z)-Butenedioic acid;

cis-Butenedioic acid [110-16-7].

116.07

DEFINITIONMaleic Acid contains NLT 99.0% and NMT 101.0% of $C_4H_4O_4$, calculated on the anhydrous basis.**IDENTIFICATION**• **A. PROCEDURE****Analysis:** Dissolve 500 mg of Maleic Acid in 10 mL of water.**Acceptance criteria:** The pH of the solution is less than 2.

- **B.** The principal spot from *Sample solution B* corresponds in color, size, and R_f value to that from *Standard solution A*, as obtained in the procedure for *Limit of Fumaric Acid*.

• **C. INFRARED ABSORPTION** <197K>**ASSAY**• **PROCEDURE****Sample solution:** 10 mg/mL of Maleic Acid**Analysis:** Titrate the *Sample solution* with 1 N sodium hydroxide VS, using phenolphthalein TS as the indicator. Each mL of 1 N sodium hydroxide is equivalent to 58.04 mg of $C_4H_4O_4$.**Acceptance criteria:** 99.0%–101.0% on the anhydrous basis**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** <281>: NMT 0.1%, determined on a 1.0-g portion

• **LIMIT OF IRON****Solution A:** Dissolve 9.7 g of potassium thiocyanate in 100 mL of water.**Diluted standard iron solution:** Immediately before use, dilute 1 volume of *Standard Iron Solution*, prepared as directed in *Iron* <241>, with 9 volumes of water.

[NOTE—This solution contains the equivalent of 1 μg/mL of iron.]

Standard solution: Add 6 mL of water to 5 mL of *Diluted standard iron solution*. Add 1 mL of diluted hydrochloric acid and 0.05 mL of bromine TS. After 5 min, remove the excess of bromine with the aid of a current of air, add 3 mL of *Solution A*, and shake well.**Sample solution:** Dissolve 1 g of Maleic Acid in 10 mL of water. Add 2 mL of diluted hydrochloric acid and 0.05 mL of bromine TS. After 5 min, remove the excess of bromine with the aid of a current of air, add 3 mL of *Solution A*, and shake well.**Analysis:** Allow the *Standard solution* and *Sample solution* to stand for 5 min.**Acceptance criteria:** Any red color in the *Sample solution* is not more intense than that in the *Standard solution* (NMT 5 ppm).• **HEAVY METALS, Method II** <231>**Test preparation:** Transfer 1.0 g of Maleic Acid to a quartz crucible, and add 0.5 g of magnesium oxide. Ignite the crucible to dull redness until a homogeneous white or grayish-white mass is obtained. Ignite at 800° for 1 h, cool, and dissolve the residue by adding two 5-mL portions of diluted hydrochloric acid. Add 0.1 mL of phenolphthalein TS, then add ammonium hydroxide until a pink color is obtained. Cool, add glacial acetic acid until the solution is decolorized, then add 0.5 mL

of glacial acetic acid in excess, and dilute with water to 20.0 mL.

Standard solution: To 0.5 g of magnesium oxide add 1.0 mL of *Standard Lead Solution*, and evaporate to dryness at 105° for 1 h. Following the procedure described for preparation of the *Test preparation*, ignite, dissolve in diluted hydrochloric acid, add ammonia and then acetic acid, and dilute with water to 20.0 mL.

Blank: Water and *Test preparation* (10:2)

Analysis: To 12 mL of the *Test preparation* add 2.0 mL of pH 3.5 *Acetate Buffer*, mix, add to 1.2 mL of thioacetamide–glycerin base TS, and mix immediately. To 10 mL of the *Standard solution* add 2.0 mL of the *Test preparation* and 2.0 mL of pH 3.5 *Acetate Buffer*, mix, add 1.2 mL of thioacetamide–glycerin base TS, and mix immediately.

Compared to the *Blank*, the solution from the *Standard solution* shows a light brown color. Dilute each of the solutions from the *Test preparation* and *Standard solution* with water to 50 mL. Allow to stand for 2 min, and view downward over a white surface.

Acceptance criteria: The color of the solution from the *Test preparation* is not darker than that of the solution from the *Standard solution* (NMT 10 ppm).

Organic Impurities

• PROCEDURE: LIMIT OF FUMARIC ACID

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Standard solution A: 2 mg/mL of USP Maleic Acid RS in acetone

Standard solution B: 1.5 mg/mL of USP Fumaric Acid RS in acetone

System suitability solution: Equal volumes of *Standard solution A* and *Standard solution B*

Sample solution A: 100 mg/mL of Maleic Acid in acetone

Sample solution B: 2 mg/mL of Maleic Acid in acetone from *Sample solution A*

Developing solvent system: Heptane, butanol, chloroform, and anhydrous formic acid (44:36:16:16)

Application volume: 10 µL for the *System suitability solution* and 5 µL each for *Standard solution A*, *Standard solution B*, *Sample solution A*, and *Sample solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *System suitability solution*, *Sample solution A*, and *Sample solution B*

Proceed as directed in *Chromatography* (621), *Thin-Layer Chromatography*, using an unsaturated chamber. Dry the plate at 100° for 15 min, and examine the plate under short-wavelength UV light at 254 nm.

Acceptance criteria: The chromatogram from the *System suitability solution* exhibits two clearly separated spots, and any spot corresponding to fumaric acid in the chromatogram from *Sample solution A* does not exceed, in size or intensity, the principal spot in the chromatogram from *Standard solution B* (NMT 1.5% of fumaric acid).

SPECIFIC TESTS

• COLOR AND CLARITY OF SOLUTION

Dilute hydrochloric acid solution: Dilute 27.5 mL of hydrochloric acid with water to 1000 mL.

Reference solution: Mix 2.4 mL of ferric chloride CS and 0.6 mL of cobaltous chloride CS with *Dilute hydrochloric acid solution* to make 10 mL. Dilute 5 mL of this solution with *Dilute hydrochloric acid solution* to make 100 mL.

Sample solution: 100 mg/mL of Maleic Acid

Analysis: Place the *Reference solution* and the *Sample solution* in matched color-comparison tubes, and compare the solutions by viewing them downward against a white surface (see *Color and Achromicity* (631)).

Acceptance criteria: The *Sample solution* is clear and not more intensely colored than the *Reference solution*.

• WATER DETERMINATION, Method I (921): NMT 2.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight glass containers, protected from light. Store at room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Fumaric Acid RS

USP Maleic Acid RS

Malic Acid

C₄H₆O₅

Hydroxybutanedioic acid, (±)-;

(±)-Malic acid;

(±)-Hydroxysuccinic acid [617-48-1].

134.09

DEFINITION

Malic Acid contains NLT 99.0% and NMT 100.5% of C₄H₆O₅.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K): On undried sample

ASSAY

• PROCEDURE

Sample: 2 g

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 40 mL of recently boiled and cooled water. Add phenolphthalein TS, and titrate to the first appearance of a faint pink color that persists for NLT 30 s. Perform a blank determination. Calculate the percentage of malic acid (C₄H₆O₅) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = volume of *Titrant* consumed by the *Sample* (mL)

B = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 67.04 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–100.5%

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **HEAVY METALS, Method II** (231): NMT 20 ppm

• **FUMARIC AND MALEIC ACIDS**

Mobile phase: 0.01 N sulfuric acid

System suitability solution: 1 mg/mL of Malic Acid, 10 µg/mL of USP Fumaric Acid RS, and 4 µg/mL of USP Maleic Acid RS in *Mobile phase*

Standard solution: 5.0 µg/mL of USP Fumaric Acid RS and 2.0 µg/mL of USP Maleic Acid RS in *Mobile phase*

Sample solution: 1.0 mg/mL of Malic Acid in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 6.5-mm × 30-cm; packing L17

Column temperature: 37 ± 1°

Flow rate: 0.6 mL/min

Injection size: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for maleic acid, malic acid, and fumaric acid are 0.6, 1.0, and 1.5, respectively.]

Suitability requirements

Resolution: NLT 2.5 for the maleic acid and malic acid peaks; NLT 7.0 for the malic acid and fumaric acid peaks

Relative standard deviation: NMT 2.0% for the maleic acid peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of maleic acid and of fumaric acid in the portion of Malic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of maleic acid or fumaric acid from the *Sample solution*

r_S = peak response of maleic acid or fumaric acid from the *Standard solution*

C_S = concentration of USP Maleic Acid RS or USP Fumaric Acid RS in the *Standard solution* (mg/mL)

C_U = concentration of Malic Acid in the *Sample solution* (mg/mL)

Acceptance criteria

Fumaric acid: NMT 1.0%

Maleic acid: NMT 0.05%

• **WATER-INSOLUBLE SUBSTANCES**

Sample: 25 g

Analysis: Dissolve the *Sample* in 100 mL of water, filter the solution through a tared filtering crucible, wash the filter with hot water, and dry at 100° to constant weight.

Acceptance criteria: The increase in weight is NMT 25 mg (0.1%).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**

USP Fumaric Acid RS

USP Maleic Acid RS

USP Malic Acid RS

Maltitol

C₁₂H₂₄O₁₁

D-Glucopyranosyl-D-glucitol [585-88-6].

344.31

DEFINITION

Maltitol contains NLT 92.0% and NMT 100.5% of D-maltitol, calculated on the anhydrous basis. The amounts of total sugars, other polyhydric alcohols, and any polyol anhydrides, if detected, are not included in the requirements

or in the calculated amount under *General Notices and Requirements, Other Impurities*.

IDENTIFICATION

• **A. PROCEDURE**

Sample solution: 1 g of Maltitol in 75 mL of water

Analysis: Transfer 3 mL of the *Sample solution* to a 15-cm test tube, and add 3 mL of freshly prepared catechol solution (1 in 10). Add 6 mL of sulfuric acid, mix again, and gently heat the tube in a flame for 30 s.

Acceptance criteria: A deep pink or wine-red color appears.

• **B.** The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Mobile phase: Water. [NOTE—Degas the *Mobile phase* before use.]

System suitability solution: 4.8 mg/g of USP Maltitol RS and 4.8 mg/g of sorbitol

Standard solution: 10 mg/g of USP Maltitol RS and 1.6 mg/g of sorbitol

Sample solution: Dissolve 0.20 g of Maltitol in water, and dilute with water to 20 g. Record the final solution weight, and mix thoroughly.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm × 10-cm; packing L34

Temperature

Column: 60 ± 2°

Detector: 35°

Flow rate: 0.5 mL/min

Injection size: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for maltitol and sorbitol are 0.48 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between maltitol and sorbitol, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of maltitol (C₁₂H₂₄O₁₁) in the portion of Maltitol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times [100/(100 - W)] \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Maltitol RS in the *Standard solution* (mg/g)

C_U = concentration of Maltitol in the *Sample solution* (mg/g)

W = percentage obtained in the test for *Water Determination*

Acceptance criteria: 92.0%–100.5% on the anhydrous basis

IMPURITIES

• **LIMIT OF NICKEL**

Sample solution: Dissolve 20.0 g of Maltitol in diluted acetic acid, and dilute with diluted acetic acid to 150 mL.

Blank solution: 150 mL of diluted acetic acid

Standard solutions: Prepare three solutions by adding 0.5, 1.0, and 1.5 mL of nickel standard solution TS to 20.0 g of Maltitol dissolved in diluted acetic acid, and dilute with the same solvent to 150 mL.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Maxima at about 232.0 nm

Lamp: Nickel hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Standard solutions* and *Sample solution*

To each sample, add 2.0 mL of a saturated ammonium pyrrolidinedithiocarbamate solution (containing 10 g/L of ammonium pyrrolidinedithiocarbamate) and 10.0 mL of methyl isobutyl ketone, and shake for 30 s. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer. Set the instrument to zero using the organic layer from the *Blank solution*. Concomitantly determine the absorbances of the organic layer from the *Samples* at least three times each. Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution*. Between each measurement, aspirate the organic layer from the *Blank solution*, and ascertain that the reading returns to zero. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution*.

Acceptance criteria: NMT 1 ppm

- **REDUCING SUGARS**

Sample: 3.3 g

Analysis: Dissolve the *Sample* in 3 mL of water with the aid of gentle heat. Cool, and add 20.0 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 min, and maintain boiling for 3 min. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of hydrochloric acid in water solution (6:94). When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added towards the end of the titration, as an indicator.

Acceptance criteria: NLT 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to NMT 0.3% of reducing sugars, as glucose. [NOTE—The amount determined in this test is not included in the calculated amount under *General Notices and Requirements, Other Impurities*.]

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count using the *Plate Method* does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g.

- **CONDUCTIVITY**

Sample solution: 200 mg/mL

Analysis: Using an appropriate conductivity meter, choose a conductivity cell that is appropriate for the properties and conductivity of the solution to be examined. Use a certified reference material, for example a solution of potassium chloride, that is appropriate for the measurement.¹

The conductivity value of the certified reference material should be near the expected conductivity value of the solution to be examined. After calibrating the apparatus

with a certified reference material solution, rinse the conductivity cell several times with water and at least twice with the aqueous solution to be examined. Measure the conductivity of the *Sample solution* at a temperature of 20°, while gently stirring with a magnetic stirrer.

Acceptance criteria: NMT 20 µS/cm

- **WATER DETERMINATION, Method I** (921): NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements are specified.
- **USP REFERENCE STANDARDS** (11)
USP Maltitol RS

Maltitol Solution

DEFINITION

Maltitol Solution is a water solution containing, on the anhydrous basis, NLT 50.0% of D-maltitol (C₁₂H₂₄O₁₁) (w/w) and NMT 8.0% of D-sorbitol (C₆H₁₄O₆) (w/w). The amounts of total sugars, other polyhydric alcohols, and any polyol anhydrides, if detected, are not included in the requirements nor in the calculated amount under *Other Impurities*.

IDENTIFICATION

- **A. PROCEDURE**

Sample: 1.4 g of Maltitol Solution

Analysis: Dissolve the *Sample* in 75 mL of water. Transfer 3 mL of this solution to a 15-cm test tube, add 3 mL of freshly prepared catechol (1 in 10), and mix. Add 6 mL of sulfuric acid, and mix. Gently heat the tube in a flame for about 30 s.

Acceptance criteria: A deep pink or wine-red color appears.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

- **C. LIMIT OF DIETHYLENE GLYCOL AND ETHYLENE GLYCOL**

Diluent: Acetone and water (96:4)

Standard stock solution: 0.5 mg/mL of USP Diethylene Glycol RS and 0.5 mg/mL of USP Ethylene Glycol RS in *Diluent*

Internal standard stock solution: 0.5 mg/mL of 1,3-butanediol (internal standard) in *Diluent*

Standard solution: 0.04 mg/mL of USP Diethylene Glycol RS, 0.04 mg/mL of USP Ethylene Glycol RS, and 0.04 mg/mL of 1,3-butanediol, in *Diluent*, prepared from the *Standard stock solution* and *Internal standard stock solution*

Sample solution: Transfer 1.0 g of Maltitol Solution to a 25-mL volumetric flask. Add 1.0 mL of water to the flask, and mix on a vortex mixer for 3 min. Add 2.0 mL of the *Internal standard stock solution* and 5 mL of *Diluent*, and mix on a vortex mixer for 3 min. Add the remaining *Diluent* to the flask to volume in two equal portions. Mix the contents for about 3 min after each addition of *Diluent*. Pass a portion of the supernatant layer through a nylon filter of 0.45-µm pore size. Discard the first 2 mL of the filtrate, and collect the rest of the filtrate for analysis. [NOTE—Acetone is used to precipitate maltitol.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 15-m fused-silica capillary column; 0.25-µm layer of phase G46

¹ Commercially available conductivity calibration solutions for conductivity meter standardization, standardized by methods traceable to the National Institute of Standards and Technology (NIST), may be used. Solutions prepared according to instructions given in ASTM Standard D1125 may be used provided the conductivity of the resultant solution is the same as that of the solution prepared from the NIST-certified material.

Temperature**Detector:** 300°**Injection port:** 240°**Column:** See temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	2
70	50	300	5

Carrier gas: Helium**Flow rate:** 3.0 mL/min**Injection size:** 1.0 µL**Injection type:** Split injection. The split ratio is about 10:1. [NOTE—A general purpose split/splitless, taper, glass wool, and deactivated liner is used.]**System suitability****Sample:** *Standard solution*

[NOTE—See the relative retention time table below.

Relative retention times are provided for information only, and the standards should be used to ensure appropriate peak identification.]

Maltodextrin

DEFINITION

Maltodextrin is a nonsweet, nutritive saccharide mixture of polymers that consists of D-glucose units, with a Dextrose Equivalent less than 20. It is prepared by the partial hydrolysis of a food grade starch with suitable acids and/or enzymes. It may be physically modified to improve its physical and functional characteristics.

ASSAY**• DEXTROSE EQUIVALENT**

Standard solution: 10 mg/mL of USP Dextrose RS

Sample solution: Transfer 5 g of Maltodextrin with the aid of hot water to a 100-mL volumetric flask, cool, add water to volume, and mix.

Analysis: Transfer 25.0-mL portions of alkaline cupric tartrate TS to each of two boiling flasks. Bring the contents of one flask to boiling within 2 min while titrating with the *Standard solution* to within 0.5 mL of the anticipated endpoint. Boil gently for 2 min. Continue to boil gently, add 2 drops of methylene blue solution (1 in 100), and complete the titration within 1 min by adding the *Standard solution* dropwise or in small increments until the blue color disappears, determined by viewing against a white background in daylight or under equivalent illumination. If more than 0.5 mL of the titrant was required after the addition of the indicator, repeat the titration, adding the necessary volume of titrant before adding the indicator. Bring the contents

of the second flask to boiling, and similarly titrate with the *Sample solution*.

Calculate the Dextrose Equivalent, on the dried basis, in the portion of Maltodextrin taken:

$$\text{Result} = [100/(1 - 0.01 \times A)] \times (C_S/C_U) \times (V_S/V_U)$$

- A* = percentage *Loss on Drying* of the Maltodextrin taken
- C_S* = concentration of USP Dextrose RS in the *Standard solution* (mg/mL)
- C_U* = concentration of Maltodextrin in the *Sample solution* (mg/mL)
- V_S* = titrated volume of the *Standard solution* (mL)
- V_U* = titrated volume of the *Sample solution* (mL)

Acceptance criteria: Less than 20 [NOTE—This is a limit test. For Maltodextrins with lower reducing values, other procedures may give other results.]

IMPURITIES

- RESIDUE ON IGNITION (281):** NMT 0.5%
- HEAVY METALS, Method II (231):** NMT 5 ppm
- LIMIT OF PROTEIN**

Sample: 10 g

Analysis: Transfer the *Sample* to an 800-mL Kjeldahl flask, and add 10 g of anhydrous potassium sulfate or sodium sulfate, 300 mg of copper selenite or mercuric oxide, and 60 mL of sulfuric acid. Gently heat the mixture, keeping the flask inclined at about a 45° angle, and after frothing has ceased, boil briskly until the solution has remained clear for about 1 h. Cool, and very cautiously add about 50 mL of water while swirling to dissipate the resulting heat. Add an additional 150–250 mL of water, mix, and cool again. Cautiously pour 75 mL (or enough to make the mixture strongly alkaline) of sodium hydroxide solution (2 in 5) down the inside of the flask so that it forms a layer under the acid solution, and then add a few pieces of granular zinc. Immediately connect the flask to a distillation apparatus consisting of a Kjeldahl connecting bulb and a condenser, the delivery tube of which extends well beneath the surface of an accurately measured excess of 0.1 N sulfuric acid contained in a 500-mL flask. Gently rotate the contents of the Kjeldahl flask to mix, and distill until all ammonia has passed into the absorbing acid solution (about 250 mL of distillate). To the receiving flask add 0.25 mL of methyl red–methylene blue TS, and titrate the excess acid with 0.1 N sodium hydroxide. Perform a blank determination, substituting pure sucrose or dextrose for the test specimen, and make any necessary correction. Each mL of 0.1 N sulfuric acid consumed is equivalent to 1.401 mg of nitrogen (N).

Calculate the percentage of N in the specimen taken, and then calculate the percentage of protein by multiplying the percentage of N by 6.25.

Acceptance criteria: NMT 0.1%

• LIMIT OF SULFUR DIOXIDE

Hydrogen peroxide solution: Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Just before use, add 3 drops of methyl red TS, and neutralize to a yellow endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

Nitrogen: Use high-purity nitrogen, with a flow regulator that will maintain a flow of 200 ± 10 mL/min. Guard against the presence of oxygen by passing the nitrogen through a scrubber, such as alkaline pyrogallol, prepared as follows. Add 4.5 g of pyrogallol to a gas-washing bottle, purge the bottle with nitrogen for 3 min, and add a solution containing 85 mL of water and 65 g of potassium hydroxide, while maintaining an atmosphere of nitrogen in the bottle.

Apparatus: The apparatus (see *Figure 1*) is designed to effect the selective transfer of sulfur dioxide from the specimen in boiling aqueous hydrochloric acid to the

Hydrogen peroxide solution. The backpressure is limited to the unavoidable pressure due to the height of the *Hydrogen peroxide solution* above the tip of the bubbler, *F*. Keeping the backpressure as low as possible reduces the likelihood that sulfur dioxide will be lost through leaks. Preboil vinyl and silicone tubing. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the flask, and clamp the joints to ensure tightness. The separatory funnel, *B*, has a capacity of 100 mL or greater. The inlet adapter, *A*, with a hose connector provides a means of applying headpressure over the solution. [NOTE—A pressure-equalizing dropping funnel is not recommended because condensate, which may contain sulfur dioxide, is deposited in the funnel and the side arm.]

Figure 1. Apparatus for the Sulfur Dioxide Test.

The round-bottomed flask, *C*, is a 1000-mL flask with three 24/40 tapered joints. The gas inlet tube, *D*, is long enough to permit introduction of the nitrogen within 2.5 cm of the bottom of the flask. The Allihn condenser, *E*, has a jacket length of 300 mm. The bubbler, *F*, is fabricated from glass according to the dimensions given in Figure 2. The *Hydrogen peroxide solution* is contained in a vessel, *G*, having an inside diameter of about 2.5 cm and a depth of about 18 cm. Circulate coolant, such as a mixture of water and methanol (4:1) maintained at 5°, to chill the condenser.

Figure 2. Bubbler (*F*) for the Sulfur Dioxide Apparatus.

Analysis: Position the *Apparatus* in a heating mantle controlled by a power-regulating device. Add 400 mL of water to the flask. Close the stopcock of the separatory funnel, and add 90 mL of 4 N hydrochloric acid to the separatory funnel. Begin the flow of *Nitrogen* at a rate of 200 ± 10 mL/min. Start the condenser coolant flow. Add 30 mL of the *Hydrogen peroxide solution* to vessel *G*. After 15 min, remove the separatory funnel, and transfer a mixture of 50.0 g of Maltodextrin and 100 mL of alcohol solution (5 in 100). Apply stopcock grease to the outer joint of the separatory funnel, return the separatory funnel to the tapered joint flask, and concomitantly resume the nitrogen flow. Apply headpressure above the hydrochloric acid solution in the separatory funnel with a rubber bulb equipped with a valve. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the flask. Continue to maintain sufficient pressure above the hydrochloric acid solution to force it into the flask. [NOTE—The stopcock may be temporarily closed, if necessary, to pump up the pressure.]

To guard against escape of sulfur dioxide (SO_2) into the separatory funnel, close the stopcock before the last few mL of hydrochloric acid drain out. Apply power to the heating mantle sufficient to cause about 85 drops of reflux/min. After refluxing for 1.75 h, remove vessel *G*, add 3 drops of methyl red TS, and titrate the contents with 0.01 N sodium hydroxide VS, using a 10-mL buret with an overflow tube and a hose connection to a carbon dioxide-absorbing tube, to a yellow endpoint that persists for at least 20 s. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)).

Calculate the quantity, in $\mu\text{g/g}$, of SO_2 in the portion of Maltodextrin taken:

$$\text{Result} = 1000 \times F \times V \times N/W$$

F = milliequivalent weight of sulfur dioxide, 32.03
V = titrant volume consumed (mL)
N = actual normality of the titrant
W = weight of Maltodextrin taken (g)

Acceptance criteria: NMT 40 $\mu\text{g/g}$ (ppm)

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.

- **pH** (791): 4.0–7.0, in a 0.2-g/mL solution in carbon dioxide-free water.
- **Loss on Drying** (731): Dry a sample at 105° for 2 h in a forced-air oven: it loses NMT 6.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, or in well-closed containers, at a temperature not exceeding 30° and a relative humidity not exceeding 50%.
- **USP REFERENCE STANDARDS** (11)
USP Dextrose RS

Maltol

$C_6H_6O_3$ 126.11
3-Hydroxy-2-methyl-4-pyrone [118-71-8].

DEFINITION

Maltol contains NLT 99.0% of maltol ($C_6H_6O_3$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)
Sample solution: 0.01 mg/mL in 0.1 N hydrochloric acid
Blank: 0.1 N hydrochloric acid

ASSAY• **PROCEDURE**

Methacrylic Acid Copolymer

(Any article currently titled *Methacrylic Acid Copolymer, Type A or Type B*, will be officially titled *Methacrylic Acid and Methyl Methacrylate Copolymer* after December 1, 2015. Any article currently titled *Methacrylic Acid Copolymer, Type C*, will be officially titled *Methacrylic Acid and Ethyl Acrylate Copolymer* after December 1, 2015. After December 1, 2015, the *Methacrylic Acid Copolymer monograph* will no longer be valid.)

Type	R ₁	R ₂	Ratio
A	CH ₃	H or CH ₃	1:1
B	CH ₃	H or CH ₃	1:2
C	CH ₃	H	1:1
or	H	C ₂ H ₅	

Type A or Type B: Poly(methacrylic acid, methyl methacrylate);
Methacrylic acid–methyl methacrylate copolymer [25086-15-1].
Type C: Poly(methacrylic acid, ethyl acrylate);
Methacrylic acid–ethyl acrylate copolymer [25212-88-8].

DEFINITION

Methacrylic Acid Copolymer consists of methacrylic acid and methyl methacrylate monomers arranged in a random distribution or consists of methacrylic acid and ethyl acrylate monomers arranged in a random distribution. It may contain suitable surface-active agents. The *Assay* and *Viscosity* requirements differ for the three types, as described in the table below.

Type	Methacrylic Acid Units, Dried Basis (%)		Viscosity mPa·s	
	Min.	Max.	Min.	Max.
A	46.0	50.6	60	120
B	27.6	30.7	50	200
C	46.0	50.6	100	200

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B. PROCEDURE:** It meets the requirements of the test for *Assay*.

ASSAY

- **PROCEDURE:**
Sample: 1 g, previously dried
Analysis: Dissolve the *Sample* in 100 mL of neutralized acetone and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically (see *Titrimetry* <541>). Each mL of 0.1 N sodium hydroxide is equivalent to 8.609 mg of methacrylic acid (C₄H₆O₂) units.
Acceptance criteria
Type A: 46.0%–50.6%
Type B: 27.6%–30.7%
Type C: 46.0%–50.6%

- **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

Organic Impurities**PROCEDURE: LIMIT OF MONOMERS**

Phosphate buffer: Prepare an aqueous solution containing 17.8 g/L of anhydrous dibasic sodium phosphate and 17.0 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 2.0. This buffer has a concentration of 0.125 M.

Sodium perchlorate solution: 35 mg/mL of sodium perchlorate. This solution has a concentration of 0.25 M.

Mobile phase: Add phosphoric acid dropwise to water to obtain a solution having a pH of 2.0. Prepare a mixture of this acidified water and methanol (80:20), and degas.

Standard solution for Type A or Type B: Dissolve 0.05 g of methacrylic acid and 0.05 g of methyl methacrylate in 5 mL of butanol, and add methanol to exactly 100 mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask. Dilute with methanol to volume. Mix 3.0 mL of this solution with 10.0 mL of *Phosphate buffer*. This solution contains 1.15 µg/mL each of methacrylic acid and methyl methacrylate.

Standard solution for Type C: Dissolve 0.01 g of methacrylic acid and 0.01 g of ethyl acrylate in 5 mL of butanol, and add methanol to exactly 100 mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask. Dilute with methanol to volume. Mix 5.0 mL of this solution with 5.0 mL of *Sodium perchlorate solution*. This solution contains about 0.5 µg/mL each of methacrylic acid and ethyl acrylate.

Sample solution for Type A or Type B: Transfer 1 g of Methacrylic Acid Copolymer, Type A or Type B, to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Add 3 mL of this solution dropwise, while continuously stirring, to a beaker that contains 10.0 mL of *Phosphate buffer*. Remove the precipitated polymer to obtain a clear supernatant by centrifugation (e.g., NLT 5000 × g for NLT 5 min). Use the clear supernatant.

Sample solution for Type C: Transfer 3 g of Methacrylic Acid Copolymer, Type C, to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Add 5 mL of this solution dropwise, while continuously stirring, to a beaker that contains 5.0 mL of *Sodium perchlorate solution*. Remove the precipitated polymer to obtain a clear supernatant by centrifugation (e.g., NLT 5000 × g for NLT 5 min). Use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 4.0-mm × 12.5-cm analytical column; 7-µm packing L1

Flow rate: 2 mL/min

Injection size: 20 µL

For Type A or Type B

System suitability

Sample: *Standard solution for Type A or Type B*

[NOTE—The relative retention times for methacrylic acid and methyl methacrylate are 1.0 and 2.8, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methacrylic acid and methyl methacrylate

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution for Type A or Type B* and *Sample solution for Type A or Type B*

Calculate the percentage of each monomer (methacrylic acid or methyl methacrylate) in the portion of Methacrylic Acid Copolymer Type A or Type B taken:

$$\text{Result} = (r_U/r_S) \times (C/W) \times V_F \times D \times F \times 100$$

r_U = monomer (methacrylic acid or methyl methacrylate) peak response from the *Sample solution for Type A or Type B*

r_S = monomer (methacrylic acid or methyl methacrylate) peak response from the *Standard solution for Type A or Type B*

C = concentration of the monomer (methacrylic acid or methyl methacrylate) in the *Standard solution for Type A or Type B* (µg/mL)

W = weight of Methacrylic Acid Copolymer Type A or Type B taken to prepare the *Sample solution for Type A or Type B* (g)

V_F = final volume of the *Sample solution for Type A or Type B*, 13 mL

D = dilution factor for preparation of the *Sample solution for Type A or Type B*, 16.7

F = conversion factor, 10^{-6} g/µg

Acceptance criteria: NMT 0.05% for the total amount of monomers

For Type C

System suitability

Sample: *Standard solution for Type C*

[NOTE—The relative retention times for methacrylic acid and ethyl acrylate are 1.0 and 2.6, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methacrylic acid and ethyl acrylate

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution for Type C* and *Sample solution for Type C*

Calculate the percentage of each monomer (methacrylic acid or ethyl acrylate) in the portion of Methacrylic Acid Copolymer Type C taken:

$$\text{Result} = (r_U/r_S) \times (C/W) \times V_F \times D \times F \times 100$$

r_U = monomer (methacrylic acid or ethyl acrylate) peak response from the *Sample solution for Type C*

r_S = monomer (methacrylic acid or ethyl acrylate) peak response from the *Standard solution for Type C*

C = concentration of the monomer (methacrylic acid or ethyl acrylate) in the *Standard solution for Type C* (µg/mL)

W = weight of Methacrylic Acid Copolymer Type C taken to prepare the *Sample solution for Type C* (g)

V_F = final volume of the *Sample solution for Type C*, 10 mL

D = dilution factor for preparation of the *Sample solution for Type C*, 10

F = conversion factor, 10^{-6} g/µg

Acceptance criteria: NMT 0.01% for the total amount of monomers

SPECIFIC TESTS

• ROTATIONAL RHEOMETER METHODS (912)

Analysis: Place 254.6 g of isopropyl alcohol and 7.9 g of water in a test flask. Add a quantity of Methacrylic Acid Copolymer, equivalent to 37.5 g of solids on the dried basis, while stirring by means of a magnetic stirrer. Close the flask, and continue stirring until the polymer has dissolved completely. Adjust the temperature to $20 \pm 0.1^\circ$. Equip a rotational viscometer with an accessory.¹ The shear rate under the test condition is NLT 1 s^{-1} and NMT 100 s^{-1} . Follow the instrument manufacturer's directions to measure the apparent viscosity.

Acceptance criteria

Type A: 60–120 mPa · s

Type B: 50–200 mPa · s

Type C: 100–200 mPa · s

• **LOSS ON DRYING (731):** Dry a sample at 110° for 6 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

• **LABELING:** Label it to state whether it is Type A, B, or C. The labeling also indicates the name and quantity of any added surface-active agent.

¹ A suitable accessory is available from Brookfield Engineering as the LV1 spindle, a cylindrical spindle 1.9 cm in diameter and 6.5 cm high attached to a shaft 0.3 cm in diameter. The spindle rotates at 30 rpm at an immersion depth of 8.15 cm.

Methacrylic Acid Copolymer Dispersion

(Title for this monograph—not to change until May 1, 2017)

(Prior to May 1, 2017, the current practice of labeling the article of commerce with the name *Methacrylic Acid Copolymer Dispersion* may be continued. Use of the name *Methacrylic Acid and Ethyl Acrylate Copolymer Dispersion* will be permitted as of May 1, 2012, but the use of this name will not be mandatory until May 1, 2017. The 60-month extension will provide the time needed by manufacturers and users to make necessary changes.)

DEFINITION

Methacrylic Acid Copolymer Dispersion is an aqueous dispersion of Methacrylic Acid and Ethyl Acrylate Copolymer in water. It contains, on the basis of the calculated amount of dry substance in the Dispersion, NLT 46.0% and NMT 50.6% of methacrylic acid units. It may contain suitable surface-active agents.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>: Proceed as directed, except to use the residue obtained in the test for *Loss on Drying* as the sample.
- **B.** It meets the requirements of the Assay.

ASSAY

PROCEDURE

Sample: 2.5 g of the Dispersion

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 100 mL of neutralized acetone. Titrate the solution as directed in *Titrimetric system*. Each mL of 0.1 N sodium hydroxide is equivalent to 8.609 mg of methacrylic acid (C₄H₆O₂) units. Calculate, on the dried basis, the percentage of methacrylic acid units in the portion of Dispersion taken:

$$\text{Result} = [V \times N/W \times (100 - L)] \times 860.9$$

V = volume of titrant consumed (mL)

N = normality of the titrant

W = weight of Dispersion taken (g)

L = percentage of the *Loss on Drying* value for the Dispersion

Acceptance criteria: 46.0%–50.6% based on the calculated amount of dry substance in the Dispersion

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: Using mild heating conditions (e.g., steam bath, sand bath) to avoid loss of material, evaporate the Dispersion to dryness prior to ignition: NMT 0.2% residue is obtained, calculated on the undried Dispersion basis.
- **HEAVY METALS, Method II** <231>: Using mild heating conditions (e.g., steam bath, sand bath) to avoid loss of material, evaporate the Dispersion to dryness prior to wetting with sulfuric acid and ignition: the color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation* (20 ppm).

Organic Impurities

LIMIT OF MONOMERS

Sodium perchlorate solution: Dissolve 3.5 g of sodium perchlorate in 100 mL of water. This solution has a concentration of 0.25 M.

Mobile phase: Add phosphoric acid dropwise to water to obtain a solution having a pH of 2.0. Prepare a mixture of this acidified water and methanol (80:20), and degas.

Standard solution: Dissolve 0.01 g of methacrylic acid and 0.01 g of ethyl acrylate in 5 mL of butanol, and add methanol to make exactly 100 mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with methanol to volume. Mix 5.0 mL of this solution with 5.0 mL of *Sodium perchlorate solution*, accurately measured. This solution contains about 0.5 µg/mL each of methacrylic acid and ethyl acrylate.

Sample solution: Transfer a quantity of Dispersion, equivalent to 3 g of solids on the dried basis, to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Add 5 mL of this solution dropwise while continuously stirring into a beaker that contains 5.0 mL of *Sodium perchlorate solution*, accurately measured. Remove the precipitated polymer by centrifugation (e.g., NLT 5000 × *g* for NLT 5 min). Use the clear supernatant.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 4.0-mm × 12.5-cm; 7-µm packing L1

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methacrylic acid and ethyl acrylate are 1.0 and 2.6, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methacrylic acid and ethyl acrylate

Relative standard deviation: NMT 5.0%, determined for each analyte

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each monomer in the solid portion of the Dispersion taken:

$$\text{Result} = (r_U/r_S) \times (C/W) \times V_f \times D \times F \times 100$$

r_U = monomer (methacrylic acid or ethyl acrylate) peak response from the *Sample solution*

r_S = monomer (methacrylic acid or ethyl acrylate) peak response from the *Standard solution*

C = concentration of the monomer (methacrylic acid or ethyl acrylate) in the *Standard solution* (µg/mL)

W = solid weight of the Dispersion, calculated on the dried basis, taken to prepare the *Sample solution* (g)

V_f = final volume of the *Sample solution*, 10 mL

D = dilution factor for preparation of the *Sample solution*, 10

F = conversion factor, 10⁻⁶ g/µg

Acceptance criteria: NMT 0.01% of total monomers, based on the weight of the solid portion of the Dispersion taken

SPECIFIC TESTS

- **COAGULUM CONTENT:** Weigh a stainless steel sieve having 90-µm openings or a suitable single-woven wire cloth with a mesh width of 90 µm, and filter 100 g of the Dispersion through it. [NOTE—Suitable single-woven wire cloth mesh meets the requirements set in ISO 9044.] Wash the sieve or the cloth with distilled water until a clear filtrate is obtained, and dry the sieve or the cloth to

constant weight at 110°: the weight of the residue does not exceed 1000 mg (1%).

- **LOSS ON DRYING** (731): Dry a sample at 110° for 6 h: it loses 68.5%–71.5% of its weight.
 - **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g.
 - **PH** (791): 2.0–3.0
 - **ROTATIONAL RHEOMETER METHODS** (912): Equip a suitable rotational viscometer with an adapter comprising a cylindrical spindle rotating within an accurately machined chamber (or tube).¹ Mix the Dispersion, pipet the volume of test specimen recommended by the instrument manufacturer into the chamber (or tube), and ensure that the temperature of the test specimen is at $20 \pm 0.1^\circ$. The shear rate under the test condition is NLT 1 s^{-1} and NMT 100 s^{-1} .² Measure the apparent viscosity following the instrument manufacturer's directions.
- Acceptance criteria:** The viscosity is between 2 and 15 mPa · s.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature. Protect from freezing.
- **LABELING:** The label indicates the name and amount of any substance added as a surface-active agent.
- **USP REFERENCE STANDARDS** (11)
USP Methacrylic Acid and Ethyl Acrylate Copolymer (1:1) RS (USP Methacrylic Acid Copolymer, Type C RS)

Methacrylic Acid and Ethyl Acrylate Copolymer Dispersion

(Title for this monograph—to become official May 1, 2017)

(Prior to May 1, 2017, the current practice of labeling the article of commerce with the name *Methacrylic Acid Copolymer Dispersion* may be continued. Use of the name *Methacrylic Acid and Ethyl Acrylate Copolymer Dispersion* will be permitted as of May 1, 2012, but the use of this name will not be mandatory until May 1, 2017. The 60-month extension will provide the time needed by manufacturers and users to make necessary changes.)

DEFINITION

Methacrylic Acid and Ethyl Acrylate Copolymer Dispersion is an aqueous dispersion of Methacrylic Acid and Ethyl Acrylate Copolymer. It contains, on the basis of the calculated amount of dry substance in the Dispersion, NLT 46.0% and NMT 50.6% of methacrylic acid units. It may contain suitable surface-active agents.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): Proceed as directed, except to use the residue obtained in the test for *Loss on Drying* as the sample.
- **B.** It meets the requirements of the Assay.

ASSAY

PROCEDURE

Sample: 2.5 g of the Dispersion
Titrimetric system
(See *Titrimetry* (541).)

¹ A commercial device is available from Brookfield as an ultra-low (UL) viscosity adapter. The adapter comprises a 0.4-cm diameter shaft, an accurately machined chamber (or tube) with an internal diameter of 2.8 cm and a depth of 13.5 cm, and a cylindrical spindle 2.5 cm in diameter and 9.1 cm in height.

² The cylindrical spindle rotates at 30 rpm.

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 100 mL of neutralized acetone. Titrate the solution as directed in *Titrimetric system*. Each mL of 0.1 N sodium hydroxide is equivalent to 8.609 mg of methacrylic acid ($\text{C}_4\text{H}_6\text{O}_2$) units. Calculate, on the dried basis, the percentage of methacrylic acid units in the portion of Dispersion taken:

$$\text{Result} = [V \times N/W \times (100 - L)] \times 860.9$$

V = volume of titrant consumed (mL)

N = normality of the titrant

W = weight of Dispersion taken (g)

L = percentage of the *Loss on Drying* value for the Dispersion

Acceptance criteria: 46.0%–50.6% based on the calculated amount of dry substance in the Dispersion

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): Using mild heating conditions (e.g., steam bath, sand bath) to avoid loss of material, evaporate the Dispersion to dryness prior to ignition: NMT 0.2% residue is obtained, calculated on the undried Dispersion basis.
- **HEAVY METALS, Method II** (231): Using mild heating conditions (e.g., steam bath, sand bath) to avoid loss of material, evaporate the Dispersion to dryness prior to wetting with sulfuric acid and ignition: the color of the solution from the *Test Preparation* is not darker than that of the solution from the *Standard Preparation* (20 ppm).

Organic Impurities

LIMIT OF MONOMERS

Sodium perchlorate solution: Dissolve 3.5 g of sodium perchlorate in 100 mL of water. This solution has a concentration of 0.25 M.

Mobile phase: Add phosphoric acid dropwise to water to obtain a solution having a pH of 2.0. Prepare a mixture of this acidified water and methanol (80:20), and degas.

Standard solution: Dissolve 0.01 g of methacrylic acid and 0.01 g of ethyl acrylate in 5 mL of butanol, and add methanol to make exactly 100 mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with methanol to volume. Mix 5.0 mL of this solution with 5.0 mL of *Sodium perchlorate solution*, accurately measured. This solution contains about 0.5 µg/mL each of methacrylic acid and ethyl acrylate.

Sample solution: Transfer a quantity of Dispersion, equivalent to 3 g of solids on the dried basis, to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Add 5 mL of this solution dropwise while continuously stirring into a beaker that contains 5.0 mL of *Sodium perchlorate solution*, accurately measured. Remove the precipitated polymer by centrifugation (e.g., NLT $5000 \times g$ for NLT 5 min). Use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 4.0-mm × 12.5-cm; 7-µm packing L1

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methacrylic acid and ethyl acrylate are 1.0 and 2.6, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methacrylic acid and ethyl acrylate

Relative standard deviation: NMT 5.0%, determined for each analyte

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each monomer in the solid portion of the Dispersion taken:

$$\text{Result} = (r_U/r_S) \times (C/W) \times V_F \times D \times F \times 100$$

- r_U = monomer (methacrylic acid or ethyl acrylate) peak response from the *Sample solution*
 r_S = monomer (methacrylic acid or ethyl acrylate) peak response from the *Standard solution*
 C = concentration of the monomer (methacrylic acid or ethyl acrylate) in the *Standard solution* ($\mu\text{g/mL}$)
 W = solid weight of the Dispersion, calculated on the dried basis, taken to prepare the *Sample solution* (g)
 V_F = final volume of the *Sample solution*, 10 mL
 D = dilution factor for preparation of the *Sample solution*, 10
 F = conversion factor, 10^{-6} g/ μg

Acceptance criteria: NMT 0.01% of total monomers, based on the weight of the solid portion of the Dispersion taken

SPECIFIC TESTS

- **COAGULUM CONTENT:** Weigh a stainless steel sieve having 90- μm openings or a suitable single-woven wire cloth with a mesh width of 90 μm , and filter 100 g of the Dispersion through it. [NOTE—Suitable single-woven wire cloth mesh meets the requirements set in ISO 9044.] Wash the sieve or the cloth with distilled water until a clear filtrate is obtained, and dry the sieve or the cloth to constant weight at 110°: the weight of the residue does not exceed 1000 mg (1%).
- **LOSS ON DRYING** (731): Dry a sample at 110° for 6 h: it loses 68.5%–71.5% of its weight.
- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g.
- **PH** (791): 2.0–3.0
- **ROTATIONAL RHEOMETER METHODS** (912): Equip a suitable rotational viscometer with an adapter comprising a cylindrical spindle rotating within an accurately machined chamber (or tube).¹ Mix the Dispersion, pipet the volume of test specimen recommended by the instrument manufacturer into the chamber (or tube), and ensure that the temperature of the test specimen is at $20 \pm 0.1^\circ$. The shear rate under the test condition is NLT 1 s^{-1} and NMT 100 s^{-1} .² Measure the apparent viscosity following the instrument manufacturer's directions.
Acceptance criteria: The viscosity is between 2 and 15 mPa · s.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature. Protect from freezing.
- **LABELING:** The label indicates the name and amount of any substance added as a surface-active agent.
- **USP REFERENCE STANDARDS** (11)
 USP Methacrylic Acid and Ethyl Acrylate Copolymer (1:1) RS (USP Methacrylic Acid Copolymer, Type C RS)

Methacrylic Acid and Ethyl Acrylate Copolymer

(Title for this new monograph—to become official December 1, 2015)

(Prior to December 1, 2015, the current practice of labeling the article of commerce with the name *Methacrylic Acid Copolymer, Type C*, may be continued. Use of the name *Methacrylic Acid and Ethyl Acrylate Copolymer* will be permitted as of December 1, 2010, but the use of this name will not be mandatory until December 1, 2015. The 60-month extension will provide the time needed by manufacturers and users to make necessary changes.)

Poly(methacrylic acid, ethyl acrylate);
 Methacrylic acid–ethyl acrylate copolymer [25212-88-8].

DEFINITION

Methacrylic Acid and Ethyl Acrylate Copolymer consists of methacrylic acid and ethyl acrylate monomers arranged in a random distribution. Methacrylic acid units in Methacrylic Acid and Ethyl Acrylate Copolymer are NLT 46.0% and NMT 50.6%, calculated on the dried basis. It may contain suitable surface-active agents.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
 Use USP Methacrylic Acid and Ethyl Acrylate Copolymer (1:1) RS for Methacrylic Acid and Ethyl Acrylate Copolymer having a range of 46.0%–50.6% for methacrylic acid units.
- **B.** It meets the requirements of the Assay.

ASSAY**PROCEDURE**

Sample: 1 g, previously dried

Analysis: Dissolve the *Sample* in 100 mL of neutralized acetone, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically (see *Titrimetry* (541)). Each mL of 0.1 N sodium hydroxide is equivalent to 8.609 mg of methacrylic acid ($\text{C}_4\text{H}_6\text{O}_2$) units.

Acceptance criteria: 46.0%–50.6% for Methacrylic Acid and Ethyl Acrylate Copolymer on the dried basis

IMPURITIES**Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.4%
- **HEAVY METALS, Method II** (231): NMT 20 ppm

Organic Impurities

- **PROCEDURE: LIMIT OF METHACRYLIC ACID AND ETHYL ACRYLATE**

Sodium perchlorate solution: 35 mg/mL of sodium perchlorate. This solution has a concentration of 0.25 M.

Mobile phase: Add phosphoric acid dropwise to water to obtain a solution having a pH of 2.0. Prepare a mixture of this acidified water and methanol (80:20) and degas.

Standard solution: Dissolve 0.01 g of methacrylic acid and 0.01 g of ethyl acrylate in 5 mL of butanol and add methanol to exactly 100 mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask. Dilute with methanol to volume. Mix 5.0 mL of this solution with 5.0 mL of *Sodium perchlorate solution*. This solution contains about 0.5 $\mu\text{g/mL}$ each of methacrylic acid and ethyl acrylate.

IMPURITIES**Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): 2.0%–3.5%
- **HEAVY METALS**, *Method II* (231): NMT 20 ppm

Organic Impurities

- **PROCEDURE: LIMIT OF METHACRYLIC ACID AND ETHYL**

ACRYLATE

Phosphoric acid solution: 0.1% phosphoric acid prepared from phosphoric acid

Mobile phase: Methanol and *Phosphoric acid solution* (3:7)

Standard solution: 1.0 µg/mL each of methacrylic acid and ethyl acrylate in methanol

Sample solution: Transfer 0.5 g of Partially-Neutralized Methacrylic Acid and Ethyl Acrylate Copolymer to a 25-mL volumetric flask, and dissolve in 20 mL of methanol. Add *Phosphoric acid solution* dropwise to precipitate the polymer while continuously stirring until the volume of 25 mL is reached. [NOTE—Stir with a magnetic stirrer for 10 min. Any volume deviation caused by the precipitation is negligible for contents in the ppm range. Use a magnetic stirrer of appropriate size to avoid a large variance from the final volume of the *Sample solution*.] As soon as the solid matter has settled, pass the supernatant through a filter of 0.45-µm pore size. [NOTE—Solution that cannot be filtered is centrifuged at $NLT\ 20,000 \times g$ for $NLT\ 30\ min$.] Use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.0-mm \times 12.5-cm analytical column, 5-µm packing L1 or 4.6-mm \times 15.0-cm analytical column, 5-µm packing L1

Flow rate: 1.2 mL/min

Injection size: 20 µL

[NOTE—Where appropriate, the volume must be adapted to the sensitivity of the detector.]

[NOTE—Column switching system may be used for extension of column lifetime.]

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methacrylic acid and ethyl acrylate are 1.0 and 2.2, respectively.]

Suitability requirements

Resolution: $NLT\ 5.0$ between methacrylic acid and ethyl acrylate

Relative standard deviation: $NMT\ 5.0\%$

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each monomer (methacrylic acid or ethyl acrylate) in the portion of Methacrylic Acid and Ethyl Acrylate Copolymer taken:

$$\text{Result} = (r_U/r_S) \times (C_S/W) \times V_F \times F \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (µg/mL)

W = weight of Partially-Neutralized Methacrylic Acid and Ethyl Acrylate Copolymer taken to prepare the *Sample solution* (g)

V_F = final volume of the *Sample solution*, 25 mL

F = conversion factor, $10^{-6}\ g/\mu g$

Acceptance criteria: $NMT\ 0.01\%$ for the total amount of monomers

SPECIFIC TESTS

- **LOSS ON DRYING** (731): Dry a sample at 110° for 6 h: it loses $NMT\ 5.0\%$ of its weight.
- **ROTATIONAL RHEOMETER METHODS** (912): Weigh 400 g of water into a short form, 600-mL beaker (internal

diameter about 80 mm and height 120 mm). After determining the *Loss on Drying*, weigh a quantity of undried Partially-Neutralized Methacrylic Acid and Ethyl Acrylate Copolymer, equivalent to 100 g on the dried basis. Transfer the sample to the beaker very slowly while effectively stirring (avoid lumps). Ensure that the stirring is very effective at the beginning and that the powder is immersed very slowly at the same time. Once the powder is dispersed and no lumps are visible, gentle stirring is then sufficient. Ensure a colloidal dispersion (milky white liquid) by stirring at room temperature for 3 h and taking care to avoid mixing in excess air. Afterwards allow the container to stand for 1 h, control the temperature to $23 \pm 0.1^\circ$, and let the entrapped air dissipate. [NOTE—Ensure that the concentration of this solution is 20% (w/w).] Determine the viscosity of this solution at $23 \pm 0.1^\circ$ using a suitable rotational viscometer with a cylindrical spindle 1.9 cm in diameter and 6.5 cm high, attached to a shaft 0.3 cm in diameter.¹ The spindle rotates at 50 rpm at an immersion depth of 8.1 cm. Follow the instrument manufacturer's directions to measure the apparent viscosity.

Acceptance criteria: 20–100 mPa · s

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **LABELING:** Label it to indicate the range of non-neutralized methacrylic acid units. The labeling also indicates the name and quantity of any emulsifier if the content is 0.10% or greater.
- **USP REFERENCE STANDARDS** (11)
USP Partially-Neutralized Methacrylic Acid and Ethyl Acrylate Copolymer (1:1) RS

Methacrylic Acid and Methyl Methacrylate Copolymer

(Title for this new monograph—to become official December 1, 2015)

(Prior to December 1, 2015, the current practice of labeling the article of commerce with the name *Methacrylic Acid Copolymer, Type A or Type B*, whichever is appropriate, may be continued. Use of the name *Methacrylic Acid and Methyl Methacrylate Copolymer* will be permitted as of December 1, 2010, but the use of this name will not be mandatory until December 1, 2015. The 60-month extension will provide the time needed by manufacturers and users to make necessary changes.)

(Ratio of H to CH_3 is either 1:1 or 1:2)

Poly(methacrylic acid, methyl methacrylate);
Methacrylic acid–methyl methacrylate copolymer
[25086-15-1].

DEFINITION

Methacrylic Acid and Methyl Methacrylate Copolymer consists of methacrylic acid and methyl methacrylate monomers arranged in a random distribution. Methacrylic acid units in Methacrylic Acid and Methyl Methacrylate Copolymer are $NLT\ 27.6\%$ and $NMT\ 50.6\%$, calculated on the dried basis. It may contain suitable surface-active agents.

¹ A suitable spindle is available from Brookfield as an LV1 spindle, or the equivalent.

IDENTIFICATION**A. INFRARED ABSORPTION** (197K)

Use USP Methacrylic Acid and Methyl Methacrylate Copolymer (1:1) RS for Methacrylic Acid and Methyl Methacrylate Copolymer, with a range of 46.0%–50.6% for methacrylic acid units.

Use USP Methacrylic Acid and Methyl Methacrylate Copolymer (1:2) RS for Methacrylic Acid and Methyl Methacrylate Copolymer, with a range of 27.6%–30.7% for methacrylic acid units.

B. It meets the requirements of the Assay.**ASSAY****PROCEDURE**

Sample: 1 g, previously dried

Analysis: Dissolve the *Sample* in 100 mL of neutralized acetone, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically (see *Titrimetry* (541)). Each mL of 0.1 N sodium hydroxide is equivalent to 8.609 mg of methacrylic acid ($C_4H_6O_2$) units.

Acceptance criteria

27.6%–30.7% for Methacrylic Acid and Methyl Methacrylate Copolymer (1:2) on the dried basis

46.0%–50.6% for Methacrylic Acid and Methyl Methacrylate Copolymer (1:1) on the dried basis

IMPURITIES**Inorganic Impurities****RESIDUE ON IGNITION** (281): NMT 0.1%**HEAVY METALS, Method II** (231): NMT 20 ppm**Organic Impurities****PROCEDURE: LIMIT OF METHACRYLIC ACID AND METHYL METHACRYLATE**

Phosphate buffer: Prepare an aqueous solution containing 17.8 g/L of anhydrous dibasic sodium phosphate and 17.0 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 2.0. This buffer has a concentration of 0.125 M.

Mobile phase: Add phosphoric acid dropwise to water to obtain a solution having a pH of 2.0. Prepare a mixture of this acidified water and methanol (80:20), and degas.

Standard solution: Dissolve 0.05 g of methacrylic acid and 0.05 g of methyl methacrylate in 5 mL of butanol, and add methanol to exactly 100 mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask. Dilute with methanol to volume. Mix 3.0 mL of this solution with 10.0 mL of *Phosphate buffer*. This solution contains 1.15 µg/mL each of methacrylic acid and methyl methacrylate.

Sample solution: Transfer 1 g of Methacrylic Acid and Methyl Methacrylate Copolymer to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Add 3 mL of this solution dropwise, while continuously stirring, to a beaker that contains 10.0 mL of *Phosphate buffer*. Remove the precipitated polymer to obtain a clear supernatant by centrifugation (e.g., NLT 5000 × g for NLT 5 min). Use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 4.0-mm × 12.5-cm analytical column; 7-µm packing L1

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methacrylic acid and methyl methacrylate are 1.0 and 2.8, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methacrylic acid and methyl methacrylate

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each monomer (methacrylic acid or methyl methacrylate) in the portion of Methacrylic Acid and Methyl Methacrylate Copolymer taken:

$$\text{Result} = (r_U/r_S) \times (C/W) \times V_F \times D \times F \times 100$$

r_U = monomer (methacrylic acid or methyl methacrylate) peak response from the *Sample solution*

r_S = monomer (methacrylic acid or methyl methacrylate) peak response from the *Standard solution*

C = concentration of the monomer (methacrylic acid or methyl methacrylate) in the *Standard solution* (µg/mL)

W = weight of Methacrylic Acid and Methyl Methacrylate Copolymer taken to prepare the *Sample solution* (g)

V_F = final volume of the *Sample solution*, 13 mL

D = dilution factor for preparation of the *Sample solution*, 16.7

F = conversion factor, 10^{-6} g/µg

Acceptance criteria: NMT 0.05% for the total amount of monomers

SPECIFIC TESTS**ROTATIONAL RHEOMETER METHODS** (912)

Analysis: Place 254.6 g of isopropyl alcohol and 7.9 g of water in a test flask. Add a quantity of Methacrylic Acid and Methyl Methacrylate Copolymer, equivalent to 37.5 g of solids on the dried basis, while stirring by means of a magnetic stirrer. Close the flask, and continue stirring until the polymer has dissolved completely. Adjust the temperature to $20 \pm 0.1^\circ$. Equip a rotational viscometer with an accessory.¹ The shear rate under the test condition is NLT 1 s^{-1} and NMT 100 s^{-1} . Follow the instrument manufacturer's directions to measure the apparent viscosity.

Acceptance criteria

60–120 mPa · s for Methacrylic Acid and Methyl Methacrylate Copolymer having a range of 46.0%–50.6% for methacrylic acid units

50–200 mPa · s for Methacrylic Acid and Methyl Methacrylate Copolymer having a range of 27.6%–30.7% for methacrylic acid units

LOSS ON DRYING (731): Dry a sample at 110° for 6 h: it loses NMT 5.0% of its weight.**ADDITIONAL REQUIREMENTS**

PACKAGING AND STORAGE: Preserve in tight containers, and store at controlled room temperature.

LABELING: Label it to indicate the range of methacrylic acid units. The labeling also indicates the name and quantity of any added surface-active agent.

USP REFERENCE STANDARDS (11)

USP Methacrylic Acid and Methyl Methacrylate Copolymer (1:1) RS (USP Methacrylic Acid Copolymer, Type A RS)

USP Methacrylic Acid and Methyl Methacrylate Copolymer (1:2) RS (USP Methacrylic Acid Copolymer, Type B RS)

¹ A suitable accessory is available from Brookfield Engineering as the LV1 spindle, a cylindrical spindle 1.9 cm in diameter and 6.5 cm high attached to a shaft 0.3 cm in diameter. The spindle rotates at 30 rpm at an immersion depth of 8.15 cm.

Methyl Alcohol

CH₄O 32.04
Methanol [67-56-1].

DEFINITION

Methyl Alcohol contains NLT 99.5% of CH₃OH.

[CAUTION—Methyl Alcohol is poisonous.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

System suitability solution: Dilute 1.0 mL of USP Methyl Alcohol RS and 1.0 mL of USP Acetone RS with tetrahydrofuran to 50 mL.

Internal standard solution: 2% (v/v) acetonitrile in tetrahydrofuran

Standard solution: 15.8 mg/mL of USP Methyl Alcohol RS in *Internal standard solution*

Sample solution: 15.8 mg/mL of Methyl Alcohol in *Internal standard solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica capillary column, coated with a 1.8-μm layer of phase G43

Temperature

Injector: 200°

Detector: 280°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	—	40	5
40	20	240	—

Carrier gas: Helium

Linear velocity: 35 cm/s

Injection type: Split ratio, 20:1

Injection size: 1 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for methyl alcohol, acetone, and acetonitrile are 1.0, about 1.6, and about 1.8, respectively.]

Suitability requirements

Resolution: NLT 15 between methyl alcohol and acetone, *System suitability solution*

Tailing factor: NLT 1.5 for methyl alcohol, *System suitability solution*

Relative standard deviation: NMT 2.0% for the ratio of the peak area of methyl alcohol to acetonitrile, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methyl alcohol (CH₃OH) in the portion of Methyl Alcohol taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio from the *Sample solution*

R_S = peak area ratio from the *Standard solution*

C_S = concentration of USP Methyl Alcohol RS in the *Standard solution* (mg/mL)

C_U = concentration of Methyl Alcohol in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 99.5%

IMPURITIES

• NONVOLATILE RESIDUE

Sample: 250 mL of Methyl Alcohol

Analysis: Evaporate the *Sample* in a 600-mL beaker on a steam bath, in a well-ventilated hood, until the volume is reduced to about 100 mL. Cool, transfer a portion of the liquid to a suitable, tared 50-mL platinum dish on a steam bath, and evaporate. Repeat the process until all of the liquid has been transferred, and then evaporate to dryness. Dry at 105° for 30 min, cool, and weigh.

Acceptance criteria: The weight of the residue does not exceed 2 mg, corresponding to NMT 0.001% (w/w).

• ACETONE AND ALDEHYDES (as acetone)

Standard solution: Dilute 1.9 mL (1.5 g) of acetone with water to 1000 mL, then dilute 1.0 mL of this solution with water to 100 mL. Dilute 2 mL of the resulting solution with water to 5 mL. The *Standard solution* contains 30 μg of acetone and is freshly prepared.

Sample solution: Dilute 1.25 mL (1 g) of Methyl Alcohol with water to 5 mL.

Analysis: Adjust to and maintain each solution at 20°. Add 5 mL of alkaline mercuric-potassium iodide TS to each of the *Standard solution* and *Sample solution*.

Acceptance criteria: Any turbidity produced in the *Sample solution* is not greater than that produced in the *Standard solution* (NMT 0.003%).

• READILY CARBONIZABLE SUBSTANCES (271)

Sample: 5 mL

Analysis: Cool 5 mL of sulfuric acid, contained in a small conical flask, to 10°, and add the *Sample* dropwise with constant mixing, maintaining the temperature below 20° throughout the test.

Acceptance criteria: No discoloration develops.

• READILY OXIDIZABLE SUBSTANCES

Sample: 20 mL of Methyl Alcohol

Analysis: Cool the *Sample* to 15°, add 0.1 mL of 0.1 N potassium permanganate, and allow to stand at 15°.

Acceptance criteria: The pink color does not completely disappear within 5 min.

SPECIFIC TESTS

• ACIDITY

Sample solution: Mix 25 mL of water with 10 mL of alcohol and 0.5 mL of phenolphthalein TS, and add 0.02 N sodium hydroxide until a slight pink color persists after shaking for 30 s. Taking precautions to avoid absorption of carbon dioxide, add 19 mL (15 g) of Methyl Alcohol.

Analysis: Titrate the *Sample solution* with 0.020 N sodium hydroxide.

Acceptance criteria: NMT 0.45 mL of 0.020 N sodium hydroxide is required to produce a pink color.

• ALKALINITY (as ammonia)

Sample: 28.6 mL (22.6 g) of Methyl Alcohol

Analysis: Mix the *Sample* with 25 mL of water, add 1 drop of methyl red TS, and titrate with 0.020 N sulfuric acid.

Acceptance criteria: NMT 0.20 mL of 0.020 N sulfuric acid is required to produce a pink color (3 ppm).

• WATER DETERMINATION, *Method 1* (921): NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, remote from heat, sparks, and open flames.

• **USP REFERENCE STANDARDS** <11>

- USP Acetone RS
USP Methyl Alcohol RS

Methyl Isobutyl Ketone

C₆H₁₂O 100.16

2-Pentanone, 4-methyl-;
4-Methyl-2-pentanone [108-10-1].

DEFINITION

Methyl Isobutyl Ketone contains NLT 99.0% of methyl isobutyl ketone (C₆H₁₂O).

IDENTIFICATION

- **A.** The IR absorption spectrum of a thin film of it between sodium chloride crystals exhibits maxima, among others, at the following wavelengths, in μm : 5.81 (vs), 6.80 (m), 7.00 (m), 7.09 (m), 7.29 (vs), 7.72 (m), 8.06 (m), 8.31 (sh), 8.53 (s), and 8.91 (m).

IMPURITIES

• **LIMIT OF NONVOLATILE RESIDUE**

Sample: 50 mL

Analysis: Evaporate the *Sample* in a tared porcelain dish on a steam bath, and dry at 105° for 1 h. Weigh the residue.

Acceptance criteria: NMT 4 mg (0.008%)

SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>: NMT 0.799, indicating NLT 99.0% of methyl isobutyl ketone (C₆H₁₂O)
- **DISTILLING RANGE**, *Method I* <721>: Between 114° and 117°, a correction factor of 0.046°/mm Hg being applied as necessary
- **ACIDITY**
Sample: 15.0 mL
Analysis: Mix the *Sample* with 15 mL of neutralized alcohol, add phenolphthalein TS, and titrate with 0.050 N sodium hydroxide.
Acceptance criteria: NMT 0.40 mL is required for neutralization.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Methyl Salicylate

C₈H₈O₃ 152.15

Benzoic acid, 2-hydroxy-, methyl ester;
Methyl salicylate [119-36-8].

DEFINITION

Methyl Salicylate is produced synthetically or is obtained by maceration and subsequent distillation with steam from the leaves of *Gaultheria procumbens* Linné (Fam. Ericaceae) or from the bark of *Betula lenta* Linné (Fam. Betulaceae). It contains NLT 98.0% and NMT 100.5% of methyl salicylate (C₈H₈O₃).

IDENTIFICATION

• **A.**

Sample: 1 drop of Methyl Salicylate

Analysis: Shake the *Sample* with 5 mL of water, and add 1 drop of ferric chloride TS.

Acceptance criteria: The resulting mixture has a deep violet color.

ASSAY

• **PROCEDURE**

Sample: 2 g of Methyl Salicylate

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: 1 N sodium hydroxide VS

Endpoint detection: Colorimetric

Analysis: Place the *Sample* in a flask, and add 40.0 mL of 1 N sodium hydroxide VS. Boil gently under a reflux condenser for 2 h. Cool, rinse the condenser and the sides of the flask with a few mL of water, and add phenolphthalein TS. Titrate the excess alkali with 1 N sulfuric acid VS. Perform a blank determination. Each mL of 1 N sodium hydroxide corresponds to 152.2 mg of methyl salicylate (C₈H₈O₃).

Acceptance criteria: 98.0%–100.5%

IMPURITIES

- **HEAVY METALS**, *Method II* <231>: NMT 20 ppm

SPECIFIC TESTS

- **SOLUBILITY IN 70% ALCOHOL:** One volume of synthetic Methyl Salicylate dissolves in 7 volumes of 70% alcohol. One volume of natural Methyl Salicylate dissolves in 7 volumes of 70% alcohol, the solution having NMT a slight cloudiness.
- **SPECIFIC GRAVITY** <841>: 1.180–1.185 for the synthetic variety; 1.176–1.182 for the natural variety
- **OPTICAL ROTATION**, *Angular Rotation* <781A>: Synthetic Methyl Salicylate and that from *Betula* are optically inactive. Methyl Salicylate from *Gaultheria* is slightly levorotatory, the angular rotation not exceeding -1.5° in a 100-mm tube.
- **REFRACTIVE INDEX** <831>: 1.535–1.538 at 20°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate whether it was made synthetically or distilled from either of the plants of *Gaultheria procumbens* or *Betula lenta*.

Methylcellulose—see Methylcellulose General Monographs

Methylene Chloride

CH₂Cl₂ 84.93

Methane, dichloro-;
Dichloromethane [75-09-2].

DEFINITION

Methylene Chloride contains NLT 99.0% of methylene chloride (CH₂Cl₂). [**CAUTION**—Perform all steps involving evaporation of methylene chloride in a well-ventilated fume hood.]

IDENTIFICATION

• **A.**

Sample: 5 mL

Analysis: Place the *Sample* into a glass-stoppered, 10-mL conical flask, and shake for several min. Remove

the stopper, quickly withdraw a portion of the vapor into a 50-mL syringe that is not fitted with a needle, and inject the vapor into a suitable evacuated gas cell.
Acceptance criteria: The IR absorption spectrum of the vapor shows strong doublet peaks at 7.8 and 7.9 μm and at 13.2 and 13.4 μm , and relatively few minor peaks.

ASSAY

• PROCEDURE

System suitability solution: Methylene chloride and chloroform (3:7)

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Thermal conductivity (under typical conditions)

Column: 4-mm \times 1.8-m; packed with 15% liquid phase G18 on 30- to 60-mesh S1C unsilanized support

Temperatures

Injection port: 200°

Detector: 250°

Column: 60°

Carrier gas: Helium

Flow rate: 20 mL/min

Injection volume: 1 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between methylene chloride and chloroform

Tailing factor: NMT 1.4

Relative standard deviation: The peak response ratio does not exceed 2% for five replicate injections.

Analysis

Sample: Methylene Chloride

Inject the *Sample*, and determine the peak responses by any convenient means. [NOTE—The order of elution is amylenes (5 or 6 peaks), if present, and then methylene chloride.]

Calculate the percentage of methylene chloride (CH_2Cl_2) in the portion of sample taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of methylene chloride

r_T = sum of all the peak responses

Acceptance criteria: NLT 99.0%

IMPURITIES

• LIMIT OF NONVOLATILE RESIDUE

Sample: 50 g

Analysis: Evaporate the *Sample* in a platinum or porcelain dish on a steam bath, and dry at 105° for 30 min.

Acceptance criteria: NMT 0.002%; NMT 1 mg of residue

• HEAVY METALS, Method I <231>

Test preparation: 15 mL (20 g)

Analysis: Evaporate the *Test preparation* in a glass evaporating dish on a steam bath to dryness. Cool, add 2 mL of hydrochloric acid, and slowly evaporate again on a steam bath to dryness. Dissolve the residue in 1 mL of 1 N acetic acid, and add 24 mL of water.

Acceptance criteria: NMT 1 $\mu\text{g/g}$

SPECIFIC TESTS

• LIMIT OF HYDROGEN CHLORIDE

Sample: 20.0 mL

Analysis: Into each of two glass-stoppered, 50-mL color-comparison cylinders having an internal diameter of 20 mm, place 10 mL of water, 2 drops of phenolphthalein TS, and sufficient 0.010 N sodium hydroxide to produce a pink color that persists after

vigorous shaking for 30 s and is of equal intensity in each cylinder.

[NOTE—In the following step, take special care to avoid contamination with carbon dioxide.]

Into one of the cylinders, place the *Sample* and 0.70 mL of 0.010 N sodium hydroxide, and shake again.

Acceptance criteria: NMT 0.001%; the pink color in the sample cylinder is at least as intense as that in the comparison cylinder, and the color persists for NLT 15 min.

• **SPECIFIC GRAVITY** <841>: 1.318–1.322

• **WATER DETERMINATION, Method I** <921>: NMT 0.02%

• FREE CHLORINE

Sample: 10 mL

Analysis: To the *Sample* add 10 mL of water and 0.1 mL of potassium iodide TS, shake for 2 min, and allow the liquids to separate.

Acceptance criteria: The lower layer does not show a violet tint.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

Methylparaben

$\text{C}_8\text{H}_8\text{O}_3$

152.15

Benzoic acid, 4-hydroxy-, methyl ester;
Methyl *p*-hydroxybenzoate [99-76-3].

DEFINITION

Methylparaben contains NLT 98.0% and NMT 102.0% of $\text{C}_8\text{H}_8\text{O}_3$.

IDENTIFICATION

• **A. INFRARED ABSORPTION** <197M>

• **B. MELTING RANGE OR TEMPERATURE** <741>: 125°–128°

ASSAY

• PROCEDURE

Mobile phase, Sample solution, Standard solution B, and Chromatographic system: Proceed as described in the procedure for *Related Substances*.

System suitability

Sample: *Standard solution B*

Suitability requirements

Relative standard deviation: NMT 0.85% for 6 injections

Analysis

Samples: *Sample solution* and *Standard solution B*

Calculate the percentage of Methylparaben in the *Sample solution*:

$$\text{Result} = P \times (r_U \times C_S)/(r_S \times C_U)$$

P = labeled purity of USP Methylparaben RS expressed as a percentage

r_U = peak area of methylparaben from the *Sample solution*

C_S = concentration of methylparaben in *Standard solution B*

r_S = peak area of methylparaben from *Standard solution B*

C_U = concentration of Methylparaben in the *Sample solution*

Acceptance criteria: 98.0%–102.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%, determined on 1.0 g

Organic Impurities

• PROCEDURE: RELATED SUBSTANCES

Mobile phase: Methanol and a 6.8 g/L solution of potassium dihydrogen phosphate (65:35 v/v)

Sample solution: Dissolve 50.0 mg of Methylparaben in 2.5 mL of methanol, and dilute with *Mobile phase* to 50.0 mL. Dilute 10.0 mL of this solution with *Mobile phase* to 100.0 mL.

Standard solution A: 5.0 µg/mL each of *p*-hydroxybenzoic acid and USP Methylparaben RS in *Mobile phase*

Standard solution B: Dissolve 50.0 mg of USP Methylparaben RS in 2.5 mL of methanol, and dilute with *Mobile phase* to 50.0 mL. Dilute 10.0 mL of this solution with *Mobile phase* to 100.0 mL.

Standard solution C: Dilute 1.0 mL of the *Sample solution* with *Mobile phase* to 20.0 mL. Dilute 1.0 mL of this solution with *Mobile phase* to 10.0 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 272 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.3 mL/min

Injection size: 10 µL

Run time: About 5 times the retention time of methylparaben

System suitability

Sample: *Standard solution A*

[NOTE—The retention time of methylparaben is about 2.3 min; the relative retention time for *p*-hydroxybenzoic acid is about 0.6.]

Suitability requirements

Resolution: NLT 2.0 between the *p*-hydroxybenzoic acid and methylparaben peaks

Analysis

Samples: *Sample solution* and *Standard solution C*
[NOTE—Disregard any limit that is 0.2 times the area of the principal peak in the chromatogram obtained with *Standard solution C* (0.1%).]

Acceptance criteria

***p*-Hydroxybenzoic acid:** The peak area in the *Sample solution*, multiplied by 1.4 to correct for the calculation of content, is NMT the area of the principal peak in *Standard solution C* (0.5%).

Unspecified impurities: The peak area of each impurity in the *Sample solution* is NMT the area of the principal peak in *Standard solution C* (0.5%).

Total impurities: The total peak area for all impurities in the *Sample solution* is NMT twice the area of the principal peak in *Standard solution C* (1.0%).

SPECIFIC TESTS

• COLOR OF SOLUTION

Sample solution: 100 mg/mL in alcohol

Comparison solution: Mix 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, and 0.4 mL of cupric sulfate CS with 0.3 N hydrochloric acid to make 10 mL. Dilute 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL. [NOTE—Prepare and use this solution immediately.]

Analysis

Samples: Alcohol, *Sample solution*, and *Comparison solution*

Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see *Color and Achromaticity* (631)).

Acceptance criteria: The *Sample solution* is clear and not more intensely colored than alcohol or the *Comparison solution*.

• ACIDITY

Sample solution: To 2 mL of the *Sample solution* prepared in the test for *Color of Solution*, add 3 mL of alcohol, 5 mL of carbon dioxide-free water, and 0.1 mL of bromocresol green TS.

Analysis: Titrate with 0.10 N sodium hydroxide.

Acceptance criteria: NMT 0.1 mL is required to produce a blue color.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS** (11)
USP Methylparaben RS

Methylparaben Sodium

DEFINITION

Methylparaben Sodium contains NLT 98.5% and NMT 101.5% of methylparaben sodium (C₈H₇NaO₃), calculated on the anhydrous basis.

IDENTIFICATION

• A.

Sample: Dissolve 0.5 g of Methylparaben Sodium in 5 mL of water, acidify with hydrochloric acid, and filter the resulting precipitate. Wash the precipitate with water, and dry it over silica gel for 5 h.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the *Sample* exhibits maxima only at the same wavelengths as that of a similar preparation of USP Methylparaben RS.

• B.

Sample solution: Ignite 0.3 g of Methylparaben Sodium, cool, and dissolve the residue in about 3 mL of 3 N hydrochloric acid.

Acceptance criteria: A platinum wire dipped in the *Sample solution* imparts an intense, persistent yellow color to a nonluminous flame.

ASSAY

• PROCEDURE

Sample: 100 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Gently reflux the *Sample* with 30 mL of 1 N sodium hydroxide for 30 min. Cool, add 25.0 mL of potassium bromate solution (5.56 mg/mL), 5 mL of potassium bromide solution (125 mg/mL), and 10 mL of hydrochloric acid, and immediately insert the stopper into the flask. Cool, shake for 15 min, and allow to stand for 15 min. Quickly add 15 mL of potassium iodide TS, taking care to avoid the escape of bromine vapor, at once replace the stopper in the flask, and shake vigorously. Rinse the stopper and the neck of the flask with a small quantity of water. Titrate the liberated iodine with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. [NOTE—About 15 mL of *Titrant* is needed.]

Perform a blank determination, and note the difference in volumes required. Each mL of the difference in volume of *Titrant* is equivalent to 2.902 mg of methylparaben sodium (C₈H₇NaO₃).

Acceptance criteria: 98.5%–101.5% on the anhydrous basis

IMPURITIES

- **CHLORIDE AND SULFATE**, *Chloride* <221>
Sample: 0.2 g
Control: 0.10 mL of 0.020 N hydrochloric acid
Acceptance criteria: 0.035%; the *Sample* shows no more chloride than the *Control*.
- **CHLORIDE AND SULFATE**, *Sulfate* <221>
Sample: 0.25 g
Control: 0.30 mL of 0.020 N sulfuric acid
Acceptance criteria: 0.12%; the *Sample* shows no more sulfate than the *Control*.

SPECIFIC TESTS

- **COMPLETENESS OF SOLUTION** <641>
Sample solution: 1 g of Methylparaben Sodium dissolved in water
Acceptance criteria: Meets the requirements
- **PH** <791>
Sample solution: 1 mg/mL
Acceptance criteria: 9.5–10.5
- **WATER DETERMINATION**, *Method I* <921>: NMT 5.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between pyrrolidone and methylpyrrolidone

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity, excluding any solvent peaks and peaks NMT 0.02%, in the portion of Methylpyrrolidone taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_T = sum of the responses of all the peaks from the *Sample solution*

Acceptance criteria: NMT 0.1% of any individual impurity; and NMT 0.3% of total impurities

SPECIFIC TESTS• **ALKALINITY**

Bromothymol blue solution: Dissolve 50 mg of bromothymol blue in a mixture of 4 mL of 0.02 M sodium hydroxide and 20 mL of alcohol, and dilute with water to 100 mL.

Sample: Methylpyrrolidone (neat)

Analysis: Add 0.5 mL of *Bromothymol blue solution* as indicator to 50 mL of water, and adjust with 0.02 M potassium hydroxide or 0.02 M hydrochloric acid until a yellow color is obtained. Add 50 mL of the *Sample*. Titrate with 0.02 M hydrochloric acid to the initial coloration.

Acceptance criteria: NMT 8.0 mL of 0.02 M hydrochloric acid is required.

• **CLARITY OF SOLUTION**

[NOTE—The *Sample* is to be compared to the *Reference suspension* in diffused daylight 5 min after preparation of the *Reference suspension*.]

Hydrazine solution: 10 mg/mL of hydrazine sulfate.

[NOTE—Allow to stand 4–6 h before use.]

Methenamine solution: Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension

[NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.]

Transfer 25.0 mL of the *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask.

[NOTE—Allow to stand for 24 h.]

Opalescence standard: Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, and dilute with water to volume. [NOTE—This suspension should not be used beyond 24 h after preparation.]

Reference suspension: Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, and dilute with water to volume.

Sample: Methylpyrrolidone (neat)

Analysis: Transfer a sufficient portion of the *Sample* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of the *Reference suspension* and water to separate matching test tubes. Compare the *Sample*, *Reference suspension*, and water in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering* <851>, *Visual Comparison*). [NOTE—The diffusion of light must be such that the *Reference suspension* can readily be distinguished from water.]

Acceptance criteria: The *Sample* shows the same clarity as that of water, or its opalescence is not more pronounced than that of the *Reference suspension*.

• COLOR OF SOLUTION

Sample Methylpyrrolidone (neat)

Analysis: Transfer a sufficient portion of the *Sample* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm, to obtain a depth of 40 mm. Similarly transfer a portion of water to a separate matching test tube. Compare the color of the *Sample* with that of water in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* <851>, *Visual Comparison*).

Acceptance criteria: The *Sample* has the color of water.

- **WATER, Method 1c** <921>: NMT 0.1%, determined on 1.0 g

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in light-resistant containers.
- **USP REFERENCE STANDARDS** <11>
USP Methylpyrrolidone RS

Mineral Oil—see *Mineral Oil General Monographs*

Mineral Oil, Rectal—see *Mineral Oil, Rectal General Monographs*

Light Mineral Oil

DEFINITION

Light Mineral Oil is a purified mixture of liquid hydrocarbons obtained from petroleum. It may contain a suitable stabilizer.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>
- **B.** It meets the requirements in *Specific Tests for Viscosity—Capillary Viscometer Methods* <911>.

IMPURITIES

• LIMIT OF POLYCYCLIC AROMATIC HYDROCARBONS

Dimethyl sulfoxide: Use spectrophotometric grade dimethyl sulfoxide.

***n*-Hexane:** Use *n*-hexane that has been washed by being shaken previously twice with one-fifth its volume of *Dimethyl sulfoxide*.

Standard solution: 7.0 µg/mL of USP Naphthalene RS in isooctane (2,2,4-trimethylpentane)

Standard blank: 2,2,4-Trimethylpentane

Sample solution: Transfer 25.0 mL of Light Mineral Oil and 25 mL of *n*-Hexane to a 125-mL separator, and mix. [NOTE—Use no lubricants other than water on the stopcock, or use a separator equipped with a suitable polymeric stopcock.]

Add 5.0 mL of *Dimethyl sulfoxide*, and shake the mixture vigorously for 1 min. Allow to stand until the lower layer is clear, transfer the lower layer to another 125-mL separator, add 2 mL of *n*-Hexane, and shake vigorously. Use the lower layer.

Sample blank: *Dimethyl sulfoxide* that has been shaken previously vigorously for 1 min with *n*-Hexane in the ratio of 5 mL of *Dimethyl sulfoxide* to 25 mL of *n*-Hexane

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: UV

Analytical wavelengths

Standard solution: 275 nm

Sample solution: 260–350 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Standard blank*, *Sample solution*, and *Sample blank*

Acceptance criteria: The absorbance at any wavelength in the specified range of the *Sample solution* is NMT one-third of the absorbance of the *Standard solution*.

SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>: 0.818–0.880

- **VISCOSITY—CAPILLARY VISCOMETER METHODS** <911>:

3.0–34.4 mm² · s⁻¹ for kinematic viscosity, measured with a capillary viscometer at 40 ± 0.1°

- **ACIDITY**

Sample solution: Combine 10 mL of Light Mineral Oil and 20 mL of boiling water, shake vigorously for 1 min, and allow to cool. Remove, and filter the aqueous layer.

Analysis: To 10 mL of the *Sample solution* add 0.1 mL of phenolphthalein TS.

Acceptance criteria: The solution does not produce a pink color. NMT 1.0 mL of 0.01 N sodium hydroxide is required to produce a pink color.

- **READILY CARBONIZABLE SUBSTANCES TEST** <271>

Sample: 5 mL

Standard solution: In a glass-stoppered test tube that previously has been rinsed with hot nitric acid (see *Cleaning Glass Apparatus* <1051>), mix 3 mL of ferric chloride CS, 1.5 mL of cobaltous chloride CS, and 0.5 mL of cupric sulfate CS then overlaid with 5 mL of Light Mineral Oil.

Analysis: Place the *Sample* in a glass-stoppered test tube that previously has been rinsed with hot nitric acid (see *Cleaning Glass Apparatus* <1051>), then rinsed with water, and dried. Add 5 mL of sulfuric acid containing 94.5%–94.9% of H₂SO₄, and heat in a boiling water bath for 10 min. After the test tube has been in the bath for 30 s, remove it quickly, and, while holding the stopper in place, give three vigorous, vertical shakes over an amplitude of about 5 in. Repeat every 30 s. Do not keep the test tube out of the bath longer than 3 s for each shaking period. At the end of 10 min from the time when first placed in the water bath, remove the test tube.

Acceptance criteria: The *Sample* may turn hazy, but it remains colorless, or shows a slight pink or yellow color, and the *Sample* does not become darker than the *Standard solution*.

- **SOLID PARAFFIN**

Sample: Light Mineral Oil that has been dried previously in a beaker at 105° for 2 h and cooled to room temperature in a desiccator over silica gel

Analysis: Fill a tall, cylindrical, standard oil-sample bottle of colorless glass of 120-mL capacity with the *Sample*. Insert the stopper, and immerse the bottle in a mixture of ice and water for 4 h.

Acceptance criteria: The *Sample* is sufficiently clear that a black line 0.5 mm in width, on a white background, held vertically behind the bottle, is clearly visible.

• **LIMIT OF SULFUR COMPOUNDS**

Solution A: Saturated solution of lead(II) oxide in sodium hydroxide (200 mg/mL)

Sample: 4.0 mL

Analysis: Combine the *Sample*, 2 mL of dehydrated alcohol, and 2 drops of *Solution A*, heat at 70° for 10 min with frequent shaking, and cool.

Acceptance criteria: No dark brown color develops.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No storage requirements specified.
- **LABELING:** Label it to indicate the name and quantity of any substance added as a stabilizer, and label packages intended for direct use by the public to indicate that it is not intended for internal use.
- **USP REFERENCE STANDARDS** <11>
USP Mineral Oil RS
USP Naphthalene RS

Topical Light Mineral Oil—see *Topical Light Mineral Oil General Monographs*

Mono- and Di-glycerides

DEFINITION

Mono- and Di-glycerides is a mixture of glycerol mono- and di-esters, with minor amounts of tri-esters, of fatty acids from edible oils. It contains NLT 40.0% of monoglycerides. The monoglyceride content is NLT 90.0% and NMT 110.0% of the value indicated in the labeling. It may contain suitable stabilizers.

ASSAY

• **MONOGLYCERIDES**

Mobile phase: Tetrahydrofuran

Sample solution: 40 mg/mL of Mono- and Di-glycerides in tetrahydrofuran

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7-mm × 60-cm; 5-μm packing L21 (100 Å)

[NOTE—Two or three 7.5-mm × 30-cm L21 columns may be used in place of one 60-cm column provided that *System suitability* requirements are met.]

Temperatures

Column: 40°

Detector: 40°

Flow rate: 1 mL/min

Injection volume: 40 μL

System suitability

Sample: *Sample solution*

[NOTE—The order of elution is triglycerides, diglycerides, monoglycerides, and glycerin.]

Suitability requirements

Relative standard deviation: NMT 1.0%, determined from the monoglycerides peak

Analysis

Sample: *Sample solution*

Calculate the percentage of monoglycerides in the portion of Mono- and Di-glycerides taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for monoglycerides

r_T = sum of the responses of all the peaks, except the solvent peak

Acceptance criteria: 90.0%–110.0% of the value indicated in the labeling

IMPURITIES

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

• **ARSENIC**, *Method II* <211>: NMT 3 μg/g

• **HEAVY METALS**, *Method II* <231>: NMT 10 μg/g

• **LIMIT OF FREE GLYCERIN**

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay* for *Monoglycerides*.

Standard solutions: 0.5, 1.0, 2.0, and 4.0 mg/mL of USP Glycerin RS in tetrahydrofuran

Analysis

Samples: *Sample solution* and *Standard solutions*

Measure the responses for the glycerin peaks. Plot the concentration, in mg/mL, of USP Glycerin RS in the *Standard solutions* versus the glycerin peak responses obtained. From the standard curve so obtained, determine the glycerin concentration in the *Sample solution*.

Calculate the percentage of glycerin in the portion of Mono- and Di-glycerides taken:

$$\text{Result} = (C_U/C_S) \times 100$$

C_U = glycerin concentration in the *Sample solution* from the standard curve (mg/mL)

C_S = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: NMT 7.0%

SPECIFIC TESTS

• **FATS AND FIXED OILS**, *Acid Value* <401>: NMT 4

• **FATS AND FIXED OILS**, *Hydroxyl Value* <401>: 90.0%–110.0% of the value indicated in the labeling

• **FATS AND FIXED OILS**, *Iodine Value* <401>: 90.0%–110.0% of the value indicated in the labeling. If the value stated in the labeling is less than 10, the iodine value is NMT 10.

• **FATS AND FIXED OILS**, *Saponification Value* <401>: 90.0%–110.0% of the value indicated in the labeling

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **LABELING:** The labeling indicates the monoglyceride content, hydroxyl value, iodine value, saponification value, and name and quantity of any stabilizers.

• **USP REFERENCE STANDARDS** <11>

Monoethanolamine

C₂H₇NO

Ethanol, 2-amino-;

2-Aminoethanol [141-43-5].

61.08

DEFINITION

Monoethanolamine contains NLT 98.0% and NMT 100.5% by weight of monoethanolamine (C₂H₇NO).

IDENTIFICATION• **A. INFRARED ABSORPTION** <197F>**ASSAY**• **PROCEDURE**

Sample solution: Weigh a glass-stoppered weighing bottle containing 25 mL of water. Add 1 g of Monoethanolamine, and reweigh.

Blank: 25 mL of water

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.5 N hydrochloric acid VS

Endpoint detection: Visual

Analysis: Transfer the *Sample solution* to a suitable flask, add a mixed indicator of 5 parts bromocresol green TS and 6 parts methyl red TS for a total of approximately 11 parts of solution. Titrate the *Sample solution* with *Titrant*. Perform a blank determination.

Calculate the percentage of monoethanolamine (C_2H_7NO) in the portion of sample taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F / W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample solution* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 61.08 mg/mEq

W = sample weight (mg)

Acceptance criteria: 98.0%–100.5%

IMPURITIES• **RESIDUE ON IGNITION** <281>: NMT 0.1%**SPECIFIC TESTS**• **SPECIFIC GRAVITY** <841>: 1.013–1.016• **DISTILLING RANGE, Method II** <721>: NLT 95% of it distills between 167° and 173°, a correction factor of 0.052° per mm applied as necessary.**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.• **USP REFERENCE STANDARDS** <11>
USP Monoethanolamine RS

Monoglyceride Citrate

Citric acid ester of glyceryl monooleate [36291-32-4].

DEFINITION

Monoglyceride Citrate is a mixture of glyceryl monooleate and its citric acid monoester, manufactured by the reaction of glyceryl monooleate with citric acid under controlled conditions. It contains NLT 14.0% and NMT 17.0% of total citric acid, calculated on the anhydrous basis.

IDENTIFICATION• **A.**

Sample: 1 g

Analysis: Reflux the *Sample* with 15 mL of 0.5 N potassium hydroxide solution in dehydrated alcohol for 1 h. Add 15 mL of water, and acidify with diluted hydrochloric acid (about 6 mL). Dissolve any oil drops or solid produced in 5 mL of hexane. Remove the hexane layer, extract again with 5 mL of hexane, and again remove the hexane layer. [NOTE—Keep the resulting aqueous layer for *Identification* tests B and C.]

Acceptance criteria: Oil drops or a white to yellowish-white solid are produced that are soluble in 5 mL of hexane.

• **B. IDENTIFICATION TESTS—GENERAL, Citrate** <191>

Sample: 1 mL of the aqueous layer resulting from *Identification* test A

Analysis: Evaporate the *Sample* in a porcelain dish.

Acceptance criteria: The residue meets the requirements.

• **C.**

Sample: 5 mL of the aqueous layer resulting from *Identification* test A

Analysis: Transfer the *Sample* to a test tube. Add excess calcium hydroxide as a powder, place in boiling water for 5 min, shaking several times, cool, and filter. Transfer one drop of the filtrate into a test tube, and add about 50 mg of potassium hydrogen sulfate. On top of the test tube, place a filter paper moistened with a reagent for acrolein consisting of a mixture of 5% nitroprusside solution in water and 20% piperidine solution in water (1:1). Heat the test tube.

Acceptance criteria: The filter paper turns blue (presence of glycerin). The color changes to light red after addition of sodium hydroxide TS.

ASSAY• **CONTENT OF CITRIC ACID**

Standard solution: 0.23 mg/mL of USP Citric Acid RS

Sample solution: Transfer 150 mg of Monoglyceride Citrate into a saponification flask, add 50 mL of 4% potassium hydroxide solution in dehydrated alcohol, and reflux for 1 h. Acidify the reaction mixture with hydrochloric acid to a pH of 2.8–3.2, transfer into a 400-mL beaker, and evaporate to dryness on a steam bath. Quantitatively transfer the contents of the beaker into a separator, using NMT 50 mL of water, and extract with three 50-mL portions of petroleum ether, discarding the extracts. Transfer the water layer to a 100-mL volumetric flask, and dilute with water to volume.

Blank: Water

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 450 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank* Pipet 2.0 mL each of the *Standard solution*, *Sample solution*, and *Blank* into separate 40-mL graduated centrifuge tubes. Add 2 mL of a 1 in 2 sulfuric acid solution and 11 mL of water to each tube. Boil for 3 min, cool, and add 5 mL of bromine TS to each tube. Dilute to 20 mL, allow to stand for 10 min, and centrifuge. Transfer 4.0 mL of the supernatant from each tube into separate 19- × 110-mm test tubes, add 1 mL of water, 0.5 mL of a 1 in 2 sulfuric acid solution, and 0.3 mL of 1 M potassium bromide, and shake. Add 0.3 mL of 1.5 N potassium permanganate, shake, and allow to stand for 2 min. Add 1 mL of a saturated solution of ferrous sulfate, shake, allow to stand for 2 min, and then dilute with water to 10 mL. Add 10.0 mL of *n*-hexane (previously washed with sulfuric acid, followed by a water wash, and then dried over anhydrous sodium sulfate), shake vigorously for 2 min, and centrifuge at low speed for 1 min. Transfer 5.0 mL of the hexane extract into a 20- × 145-mm tube containing 10.0 mL of 4% sodium sulfide solution, and briefly shake vigorously (three oscillations only). Centrifuge the mixture at low speed for 1 min. Immediately determine the absorbance of each aqueous layer from the *Standard solution* and *Sample solution* against the aqueous layer from the *Blank*. Calculate the percentage of citric acid in the portion of Monoglyceride Citrate taken:

$$\text{Result} = (A_U/A_S) \times (V \times C_S/W) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

V = volume of the *Sample solution* (mL)

C_s = concentration of USP Citric Acid RS in the *Standard solution* (mg/mL)

W = weight of Monoglyceride Citrate taken to prepare the *Sample solution* (mg)

Acceptance criteria: 14.0%–17.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.3%, determined on 1 g
- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Acid Value* (401): 70–100
- **FATS AND FIXED OILS**, *Saponification Value* (401): 260–265
- **WATER DETERMINATION**, *Method I* (921): NMT 0.2%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.
- **USP REFERENCE STANDARDS** (11)
USP Citric Acid RS

Monosodium Glutamate

DEFINITION

Monosodium Glutamate contains NLT 99.0% and NMT 100.5% of $C_5H_8NNaO_4 \cdot H_2O$.

IDENTIFICATION

- **A.**
Sample solution: 1 in 30
Analysis: To 1 mL of the *Sample solution* add 1 mL of ninhydrin TS and 100 mg of sodium acetate, and heat in a boiling water bath for 10 min.
Acceptance criteria: An intense, violet blue color is formed.
- **B.**
Sample solution: 1 in 10
Analysis: To 10 mL of the *Sample solution* add 5.6 mL of 1 N hydrochloric acid.
Acceptance criteria: A white, crystalline precipitate of glutamic acid is formed on standing. Precipitation is promoted by agitation. When 6 mL of 1 N hydrochloric acid is added to the turbid solution, the glutamic acid dissolves on stirring.
- **C. IDENTIFICATION TESTS—GENERAL**, *Sodium* (191): It meets the requirements of the pyroantimonate precipitate test.

ASSAY

- **PROCEDURE**
Sample: 250 mg
Titrimetric system
(See *Titrimetry* (541).)
Mode: Direct titration
Titrant: 0.1 N perchloric acid VS
Blank: 100 mL of glacial acetic acid with a few drops of water
Endpoint detection: Potentiometric
Analysis: Wet the *Sample* with a few drops of water. Dissolve in 100 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS. Perform a blank determination.
Calculate the percentage of monosodium glutamate ($C_5H_8NNaO_4 \cdot H_2O$) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = volume of *Titrant* consumed by the *Sample* (mL)

B = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 93.56 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–100.5%

IMPURITIES

- **CHLORIDE AND SULFATE**, *Chloride* (221): A 280-mg portion shows no more chloride than corresponds to 1.0 mL of 0.020 N hydrochloric acid (0.25%).
- **LEAD** (251): NMT 10 ppm
- **HEAVY METALS**, *Method II* (231): NMT 20 ppm

SPECIFIC TESTS

• CLARITY AND COLOR OF SOLUTION

Sample solution: 1.0 g in 10 mL of water

Standard solution: To 0.2 mL of a solution of sodium chloride containing 10 µg/mL of chloride ion (Cl), add 20 mL of water, and mix. Then add 1 mL of 5 N nitric acid, 0.2 mL of dextrin solution (1 in 50), and 1 mL of silver nitrate TS, and allow to stand for 15 min.

Analysis: Compare the *Sample solution* with the *Standard solution* (see *Spectrophotometry and Light-Scattering—Visual Comparison* (851)).

Acceptance criteria: The *Sample solution* is colorless and has no more turbidity than the *Standard solution*.

• OPTICAL ROTATION, *Specific Rotation* (781S)

Sample solution: 100 mg/mL in 2 N hydrochloric acid
Acceptance criteria: +24.8° to +25.3°, determined at 20°

- **PH** (791): 6.7–7.2, in a solution (1 in 20)
- **LOSS ON DRYING** (731): Dry a sample at 100° for 5 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Monothioglycerol

$C_3H_8O_2S$
1,2-Propanediol, 3-mercapto-;
3-Mercapto-1,2-propanediol [96-27-5].

108.16

DEFINITION

Monothioglycerol contains NLT 97.0% and NMT 101.0% of monothioglycerol ($C_3H_8O_2S$), calculated on the anhydrous basis.

ASSAY

- **PROCEDURE**
Sample: 400 mg
Titrimetric system
(See *Titrimetry* (541).)
Mode: Direct titration
Titrant: 0.1 N iodine VS
Endpoint detection: Visual
Analysis: Dissolve the *Sample* in 50 mL of water. Titrate with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Each mL of *Titrant* is equivalent to 10.82 mg of monothioglycerol ($C_3H_8O_2S$).
Acceptance criteria: 97.0%–101.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **SELENIUM** (291)
 - Test solution: 200 µL
 - Acceptance criteria: 30 µg/g
- **HEAVY METALS, Method II** (231): NMT 20 µg/g

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 1.241–1.250
- **REFRACTIVE INDEX** (831): 1.521–1.526
- **PH** (791)
 - Sample solution: 1 in 10
 - Acceptance criteria: 3.5–7.0
- **WATER DETERMINATION, Method II** (921): NMT 5.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Myristic Acid**Change to read:****DEFINITION**

Myristic Acid is obtained from coconut oil and other fats. It contains NLT 97.0% of myristic acid ($C_{14}H_{28}O_2$).

IDENTIFICATION**Add the following:**

- ▲ • **A. INFRARED ABSORPTION** (197D) or (197K)
 - Sample: Undried specimen
 - Acceptance criteria: Meets the requirements ▲ NF31

Add the following:

- ▲ • **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Fats and Fixed Oils, Fatty Acid Composition* in the *Assay*. ▲ NF31

ASSAY

- **FATS AND FIXED OILS, Fatty Acid Composition** (401)
 - System suitability solution:** Prepare as directed in the chapter, except that only stearic acid and palmitic acid are used.
 - Sample solution:** Prepare as directed for the *Test Solution* in the chapter.
 - Standard solution:** Prepare as directed for the *Sample solution*, using 100 mg of USP Myristic Acid RS instead of the substance to be examined.
 - Chromatographic system:** Prepare as directed in the chapter.
 - Injection size:** 1 µL
 - System suitability**
 (See *Chromatography* (621), *System Suitability*.)

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between methyl stearate and methyl palmitate

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the methyl myristate peak from the *Sample solution* by comparing the retention times of the peaks with those from the *Standard solution*. Measure the responses for all the peaks from the *Sample solution*, excluding the solvent peak.

Calculate the percentage of myristic acid ($C_{14}H_{28}O_2$) in the portion of Myristic Acid taken:

$$\text{Result} = (A/B) \times 100$$

A = peak response for methyl myristate from the *Sample solution*

B = sum of all the peak responses in the *Sample solution* except the solvent peak

Acceptance criteria: NLT 97.0%

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **LIMIT OF LEAD**

[NOTE—Select reagents with as low a lead content as practicable, and store all solutions in high-density polyethylene containers. Rinse all plastic and glassware thoroughly with warm 8 N nitric acid followed by deionized water.]

Standard stock solution: Dissolve 160 mg of lead nitrate in 100 mL of water containing 1 mL of nitric acid. Dilute with water to 1000 mL.

Standard solutions: [NOTE—Prepare these solutions on the day of use.] Transfer 10.0 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with water to volume. Each mL of this solution contains the equivalent of about 10 µg of lead. Dilute accurately measured volumes of the diluted *Standard stock solution* with water to obtain solutions with known concentrations of 1, 2, and 5 µg/mL of lead.

Sample solution: Transfer 5 g of Myristic Acid to an evaporating dish. Add 5 mL of a 25% sulfuric acid solution, and distribute the sulfuric acid uniformly through the sample. Within a hood, place the dish on a steam bath to evaporate most of the water. Place the dish on a burner, and slowly pre-ash the sample by expelling most of the sulfuric acid. Place the dish in a muffle furnace that has been set at 525°, and ash the sample until the residue appears free from carbon. Prepare a blank by ashing 5 mL of a 25% sulfuric acid solution. Cool, and cautiously wash down the inside of each evaporation dish with water. Treat both the sample and the blank as follows. Add 5 mL of 1 N hydrochloric acid. Place each dish on a steam bath, and evaporate to dryness. To each dish add 1.0 mL of 3 N hydrochloric acid and about 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer each solution quantitatively to a 10-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 283.3 nm at the lead emission line

Lamp: Lead electrodeless discharge

Flame: Air-acetylene with a suitable burner head

Slit width: 0.7 nm

Blank: Water. [NOTE—Perform a blank determination following the manufacturer's operating instructions.]

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*
 Determine the corrected absorbance values by subtracting the absorbance of the *Blank* from the absorbance of each of the *Standard solutions* and from

the absorbance of the *Sample solution*. Prepare a standard curve by plotting the corrected absorbance values of the *Standard solutions* versus their corresponding concentration, in $\mu\text{g/mL}$. From the calibration curve, determine the lead concentration in the *Sample solution*.

Calculate the lead content, in ppm, in the portion of Myristic Acid taken:

$$\text{Result} = (C/W_s) \times V$$

C = measured concentration of lead in the *Sample solution* from the standard curve ($\mu\text{g/mL}$)

W_s = weight of Myristic Acid taken (g)

V = final volume of the *Sample solution*, 10 mL

Acceptance criteria: NMT 2 ppm

Add the following:

▲ • LIMIT OF MINERAL ACIDS

Sample: 5 g of melted Myristic Acid

Analysis: Shake the *Sample* with an equal volume of hot water for 2 min, cool, and filter.

Acceptance criteria: The filtrate is not reddened by the addition of 1 drop of methyl orange TS.▲ NF31

SPECIFIC TESTS

- **CONGEALING TEMPERATURE** <651>: 48°–55.5°
- **FATS AND FIXED OILS**, Acid Value <401>: 242–249
- **FATS AND FIXED OILS**, Iodine Value <401>: NMT 1.0

Delete the following:

- ▲ • **FATS AND FIXED OILS**, Saponification Value <401>: 242–251▲ NF31

Add the following:

- ▲ • **FATS AND FIXED OILS**, Peroxide Value <401>: NMT 10.0▲ NF31
- **FATS AND FIXED OILS**, Unsaponifiable Matter <401>: NMT 1%
- **WATER DETERMINATION**, Method I <921>: NMT 0.2%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers. No storage requirements specified.
- **USP REFERENCE STANDARDS** <11>
USP Myristic Acid RS

Myristyl Alcohol

DEFINITION

Myristyl Alcohol contains NLT 90.0% of myristyl alcohol ($\text{C}_{14}\text{H}_{30}\text{O}$), the remainder consisting chiefly of related alcohols.

IDENTIFICATION

- **A**. The retention time of the major peak of the *Sample solution* corresponds to that of the *System suitability solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

System suitability solution: 9 mg/mL of USP Myristyl Alcohol RS and 1 mg/mL of USP Cetyl Alcohol RS in alcohol

Sample solution: 10 mg/mL of Myristyl Alcohol in dehydrated alcohol

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: GC

Detector: Flame ionization

Column: 3-mm \times 2-m, packed with 10% liquid phase G2 on support S1A

Temperature

Column: 205°

Detector: 250°

Injector port: 275°

Carrier gas: Helium

Injection size: 2 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between cetyl alcohol and myristyl alcohol

Relative standard deviation: NMT 1.5%

Analysis

Sample: *Sample solution*

Calculate the percentage of myristyl alcohol ($\text{C}_{14}\text{H}_{30}\text{O}$) in the portion of Myristyl Alcohol taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of myristyl alcohol from the *Sample solution*

r_T = sum of the peak areas except the solvent peak from the *Sample solution*

Acceptance criteria: NLT 90.0%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, Class II <741>: 36° to 42°
- **FATS AND FIXED OILS**, Acid Value <401>: NMT 2
- **FATS AND FIXED OILS**, Iodine Value <401>: NMT 1
- **FATS AND FIXED OILS**, Hydroxyl Value <401>

Sample: Place 2 g in a dry, glass-stoppered, 250-mL flask, and add 2 mL of pyridine, followed by 10 mL of toluene. To the mixture add 10.0 mL of a solution of acetyl chloride, prepared by mixing 10 mL of acetyl chloride with 90 mL of toluene. Insert the stopper in the flask, and immerse in a water bath heated at 60° to 65° for 20 min. Add 25 mL of water, again insert the stopper in the flask, and shake vigorously for several minutes to decompose the excess acetyl chloride.

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: Acetyl chloride

Back titrant: 1 N sodium hydroxide VS

Blank: Proceed as directed for the *Sample*, omitting Myristyl Alcohol.

Endpoint detection: Colorimetric

Analysis: Add 0.5 mL of phenolphthalein TS to the *Sample* and *Blank*. Titrate each to a permanent pink endpoint with 1 N sodium hydroxide VS, shaking the flask vigorously toward the end of the titration to maintain the contents in an emulsified condition.

Calculate the hydroxyl value:

$$\text{Result} = [(V_U - V_B) \times F]/W$$

V_U = volume of 1 N sodium hydroxide consumed by the *Sample* (mL)

V_B = volume of 1 N sodium hydroxide consumed by the *Blank* (mL)

F = equivalent weight of potassium hydroxide, 56.1 mg/mEq

W = weight of the *Sample* (g)

Acceptance criteria: 250–267

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>
USP Cetyl Alcohol RS
USP Myristyl Alcohol RS

Neotame

$C_{20}H_{30}N_2O_5$ 378.46
 L-Phenylalanine, *N*-[*N*-(3,3-dimethylbutyl)-*L*-α-aspartyl]-
 1-methyl ester;
N-[*N*-(3,3-Dimethylbutyl)-*L*-α-aspartyl]-*L*-phenylalanine
 1-methyl ester [165450-17-9].

DEFINITION

Neotame contains NLT 97.0% and NMT 102.0% of neotame ($C_{20}H_{30}N_2O_5$), calculated on the anhydrous basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

ASSAY

• PROCEDURE

Mobile phase: Dissolve 3.0 g of sodium 1-heptanesulfonate in 740 mL of water in a suitable 1000-mL vessel, and add 3.8 mL of triethylamine. Adjust the resulting solution with phosphoric acid to a pH of 3.5, and dilute with water to 750 mL. Add 250 mL of acetonitrile, and adjust with phosphoric acid to an apparent pH of 3.7.

Standard solution: 1.0 mg/mL of USP Neotame RS in *Mobile phase*

Sample solution: 1.0 mg/mL of Neotame in *Mobile phase*.

[NOTE—This solution is stable for up to 32 h when stored at a temperature of 0°–10°.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 10-cm; packing L1

Column temperature: 45°

Flow rate: 1.5 mL/min

Injection size: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of neotame ($C_{20}H_{30}N_2O_5$) in the portion of Neotame taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Neotame RS in the *Standard solution* (mg/mL)

C_U = concentration of Neotame in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the anhydrous basis

IMPURITIES

• RESIDUE ON IGNITION (281): NMT 0.2%

• LEAD (251)

[NOTE—Use acid-cleaned (mixture of 5% nitric acid and 5% hydrochloric acid followed by rinsing with water) autosampler cups and volumetric glassware to avoid contamination. For the preparation of all aqueous solutions and for the rinsing of glassware before use,

use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of lead as practicable. Store standards and samples in acid-cleaned polyethylene containers.]

Diluent: Transfer 2 mL of lead-free nitric acid into a 1000-mL volumetric flask, dilute with water to volume, and mix.

Standard stock solution: 79.9 mg of lead nitrate in 100 mL of *Diluent* in a 500-mL volumetric flask, and dilute with *Diluent* to volume. Transfer 10.0 mL of the resulting solution into a 100-mL volumetric flask, and dilute with *Diluent* to volume. Each mL of the *Standard stock solution* contains the equivalent of 10 μg of lead.

Standard solution A: Dilute an aliquot of the *Standard stock solution* with *Diluent* to obtain a solution having a concentration of 0.03 μg/mL.

Standard solution B: Dilute an aliquot of the *Standard stock solution* with *Diluent* to obtain a solution having a concentration of 0.015 μg/mL.

Sample solution: Transfer 160 mg of Neotame to a 10-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume.

Blank: *Diluent*

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer with a graphite furnace, pyrolytically coated graphite tubes, a solid pyrolytic graphite platform, and a background compensation system

Analytical wavelength: 283.3 nm

Lamp: Lead hollow-cathode

Purge gas: Argon

Alternate gas: Breathing-quality air

Volume: 15 μL. [NOTE—Optimize the instrument program as recommended by the manufacturer for lead, using a char temperature of 500° and an atomization temperature of 2000°.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Sample solution*, and *Blank*

Correct the area responses of the *Sample solution*, *Standard solution A*, and *Standard solution B* for the *Blank* area response. Generate the appropriate lead calibration algorithm, and determine the lead concentration in the *Sample solution*, in μg/mL. Calculate the ppm of lead in the portion of Neotame taken:

$$\text{Result} = (C/W) \times V \times F$$

C = blank-corrected lead concentration in the *Sample solution* (μg/mL)

W = weight of Neotame taken to prepare the *Sample solution* (mg)

V = volume of the *Sample solution*, 10 mL

F = conversion of mg to g

Acceptance criteria: NMT 2 ppm

• RELATED COMPOUNDS

Mobile phase and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution A: 0.03 mg/mL of USP Neotame Related Compound A RS in *Mobile phase*

Standard solution B: Prepare as directed for the *Standard solution* in the *Assay*.

Detector sensitivity solution: Transfer 2 mL of *Standard solution A* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: 2 mg/mL of Neotame in *Mobile phase*. [NOTE—This solution is stable for up to 32 h when stored at a temperature of 0° to 10°.]

System suitability

Samples: *Standard solution A* and *Detector sensitivity solution*

Suitability requirements

Signal-to-noise ratio: NLT 10, *Detector sensitivity solution*

Relative standard deviation: NMT 5.0%, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of neotame related compound A in the portion of Neotame taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = neotame related compound A peak response from the *Sample solution*

r_S = neotame related compound A peak response from *Standard solution A*

C_S = concentration of USP Neotame Related Compound A RS in *Standard solution A* (mg/mL)

C_U = concentration of Neotame in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 1.5%

Calculate the percentage of other impurities in the portion of Neotame taken:

$$\text{Result} = (r_T/r_S) \times (C_S/C_U) \times 100$$

r_T = sum of the responses of all impurity peaks (except that of neotame related compound A and the solvent peak, if observed) in the *Sample solution*

r_S = response of the neotame peak in *Standard solution B*

C_S = concentration of USP Neotame RS in *Standard solution B* (mg/mL)

C_U = concentration of Neotame in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 2.0%

SPECIFIC TESTS

- **OPTICAL ROTATION**, *Specific Rotation* (781S): -40.0° to -43.4° , at 20°

Sample solution: 5 mg/mL in water

- **WATER DETERMINATION**, *Method 1c* (921): NMT 5.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, store in a dry place, and avoid exposure to excessive heat.
- **USP REFERENCE STANDARDS** (11)
 - USP Neotame RS
 - USP Neotame Related Compound A RS
 - N*-[3,3-Dimethylbutyl]-L- α -aspartyl]-L-phenylalanine.

Nitric Acid

HNO₃ 63.01
Nitric acid [7697-37-2].

DEFINITION

Nitric Acid contains NLT 69.0% and NMT 71.0%, by weight, of nitric acid (HNO₃). [CAUTION—Avoid contact, because Nitric Acid rapidly destroys tissues.]

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, *Nitrate* (191): Meets the requirements

ASSAY• **PROCEDURE**

Sample solution: To 2 mL of Nitric Acid in a tared, glass-stoppered conical flask add 25 mL of water. Add methyl red TS.

Analysis: Titrate the *Sample solution* with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 63.01 mg of HNO₃ (see *Titrimetry* (541)).

Acceptance criteria: 69.0%–71.0%

IMPURITIES• **RESIDUE ON IGNITION** (281)

Sample: 70 mL (100 g)

Analysis: Place the *Sample* in a tared crucible, add 2 drops of sulfuric acid, and evaporate to dryness. Ignite for 15 min.

Acceptance criteria: NMT 0.5 mg (5 ppm)

• **CHLORIDE AND SULFATE**, *Chloride* (221)

Sample: 35 mL (50 g)

Control: 35 μ L of 0.020 N hydrochloric acid

Acceptance criteria: NMT 0.5 ppm; the *Sample* shows no more chloride than corresponds to the *Control*.

• **CHLORIDE AND SULFATE**, *Sulfate* (221)

Sample: 28 mL

Control: 40 μ L of 0.020 N sulfuric acid in an equal volume of solution containing the quantities of reagents used in the analysis

Analysis: Add 10 mg of sodium carbonate to the *Sample*. Evaporate to dryness, dissolve in a mixture of 4 mL of water and 1 mL of dilute hydrochloric acid (50 mg/mL), and filter if necessary. Wash with two 2-mL portions of water, dilute with water to 10 mL, and add 1 mL of barium chloride TS. Observe 10 min after adding the barium chloride.

Acceptance criteria: 1 ppm; any turbidity produced by the *Sample* is not greater than that produced by the *Control*.

• **IRON** (241)

Sample: 35 mL (50 g)

Analysis: Evaporate the *Sample* to dryness, dissolve the residue in 2 mL of hydrochloric acid, and dilute with water to 47 mL.

Acceptance criteria: NMT 0.2 μ g/g

• **HEAVY METALS**, *Method I* (231)

Test preparation: To 70 mL (100 g) of Nitric Acid in a 250-mL beaker add 10 mg of sodium carbonate, and evaporate on a steam bath to dryness. Add 25 mL of water.

Acceptance criteria: NMT 0.2 ppm

SPECIFIC TESTS• **CLARITY AND COLOR OF SOLUTION**

Analysis: Mix it in its original container, and transfer 10 mL to a 20- \times 150-mm test tube. Compare with water in a similar test tube.

Acceptance criteria: The liquids are equally clear and free from suspended matter, and when viewed transversely by transmitted light, exhibit no apparent difference in color.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Nitrogen

N₂ 28.01
Nitrogen [7727-37-9].

DEFINITION

Nitrogen contains NLT 99.0%, by volume, of nitrogen (N₂).

IDENTIFICATION

- **A.** The flame of a burning wood splinter is extinguished when inserted into a test tube filled with Nitrogen. [NOTE—Exercise caution.]

ASSAY• **PROCEDURE**

Sample: Nitrogen

Standard: Oxygen–helium certified standard (see *Reagents, Indicators, and Solutions*)

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Thermal conductivity

Column: 3-m length × 4-mm inside diameter: molecular sieve prepared from a synthetic alkali-metal aluminosilicate capable of absorbing molecules having diameters of up to 0.5 nm and completely separating oxygen from nitrogen

Carrier gas: Helium (99.99%)

Temperature: Thermostatically controlled

Analysis

Samples: *Standard* and *Sample*

Introduce the *Samples* separately into the gas chromatograph by means of a gas sampling valve.

Acceptance criteria: The peak response produced by the *Sample* exhibits a retention time corresponding to that produced by the *Standard* and is equivalent to NMT 1.0% of oxygen when compared to the peak response of the *Standard*, indicating NLT 99.0%, by volume, of N₂.

SPECIFIC TESTS

[NOTE—Reduce the container pressure by means of a regulator. Measure the gases with a gas volume meter downstream from the detector tube to minimize contamination or change of the specimens.]

• **CARBON MONOXIDE**

Sample: 1000 ± 50 mL

Analysis: Pass the *Sample* through a carbon monoxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

Acceptance criteria: NMT 10 ppm

• **LIMIT OF OXYGEN**

Analysis: Determined as directed in the *Assay*

Acceptance criteria: NMT 1.0%

• **ODOR**

Analysis: Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose.

Acceptance criteria: No appreciable odor is discernible.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in cylinders.

Nitrogen 97 Percent

DEFINITION

Nitrogen 97 Percent is Nitrogen produced from air by physical separation methods. It contains NLT 97.0%, by volume, of nitrogen (N₂).

IDENTIFICATION

- **A.** The flame of a burning wood splinter is extinguished when inserted into a test tube filled with Nitrogen 97 Percent. [NOTE—Exercise caution.]

ASSAY• **PROCEDURE**

Standard: Oxygen–helium certified standard (see *Reagents, Indicators, and Solutions*)

Sample: Nitrogen 97 Percent

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Thermal conductivity

Column: 3-m length × 4-mm inside diameter: molecular sieve prepared from a synthetic alkali-metal aluminosilicate capable of absorbing molecules having diameters of up to 0.5 nm and completely separating oxygen from nitrogen

Carrier gas: Helium (99.99%)

Temperature: Thermostatically controlled

Analysis

Samples: *Standard* and *Sample*

Introduce the *Samples* separately into the gas chromatograph by means of a gas sampling valve.

Acceptance criteria: The peak response produced by the *Sample* exhibits a retention time corresponding to that produced by the *Standard* and is equivalent to NMT 3.0% of oxygen when compared to the peak response of the *Standard*, indicating NLT 97.0%, by volume, of nitrogen (N₂).

IMPURITIES

[NOTE—Reduce the container pressure by means of a regulator. Measure the gases with a gas volume meter downstream from the detector tube to minimize contamination or change of the specimens.]

• **CARBON DIOXIDE**

Sample: 1000 ± 50 mL

Analysis: Pass the *Sample* through a carbon dioxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

Acceptance criteria: The indicator change corresponds to NMT 300 ppm

• **CARBON MONOXIDE**

Sample: 1000 ± 50 mL

Analysis: Pass the *Sample* through a carbon monoxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

Acceptance criteria: NMT 10 ppm

• **SULFUR DIOXIDE**

Sample: 1000 ± 50 mL

Analysis: Pass the *Sample* through a sulfur dioxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

Acceptance criteria: NMT 5 ppm

• **LIMIT OF NITRIC OXIDE AND NITROGEN DIOXIDE**

Sample: 500 ± 50 mL

Analysis: Pass the *Sample* through a nitric oxide–nitrogen dioxide detector tube (see *Reagents, Indicators, and Solutions*) at the rate specified for the tube.

Acceptance criteria: NMT 2.5 ppm

• **LIMIT OF OXYGEN**

Analysis: Determined as directed in the *Assay*

Acceptance criteria: NMT 3.0%

SPECIFIC TESTS• **ODOR**

Analysis: Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose.

Acceptance criteria: No appreciable odor is discernible.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in cylinders or in a low-pressure collecting tank.
- **LABELING:** Where it is piped directly from the collecting tank to the point of use, label each outlet “Nitrogen 97 Percent”.

Nonoxynol 9—see Nonoxynol 9 General Monographs

Octoxynol 9

Poly(oxy-1,2-ethanediyl), α -(octylphenyl)- ω -hydroxy-; Polyethylene glycol mono(octylphenyl) ether [9002-93-1].

DEFINITION

Octoxynol 9 is an anhydrous liquid mixture consisting chiefly of mono(octylphenyl) ethers of polyethylene glycols, corresponding to: $\text{C}_8\text{H}_{17}\text{C}_6\text{H}_4(\text{OCH}_2\text{CH}_2)_n\text{OH}$ in which the average value of n is about 9.

IDENTIFICATION

- A. INFRARED ABSORPTION (197F)**
Sample: Undried specimen
Acceptance criteria: Meets the requirements

IMPURITIES

- RESIDUE ON IGNITION (281):** NMT 0.4%
- HEAVY METALS (231):** NMT 20 ppm
- LIMIT OF FREE ETHYLENE OXIDE**

Stripped octoxynol 9: Maintain Octoxynol 9 at a temperature of 150° with constant stirring in an open vessel until it no longer displays a peak for ethylene oxide when chromatographed as directed below.

System suitability solution: 10 µg/mL of ethylene oxide and 10 µg/mL of acetaldehyde in *Stripped octoxynol 9*

Standard stock solution: [CAUTION—Ethylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated hood, using great care.] Chill all apparatus and reagents used in the preparation of standards in a refrigerator or freezer before use. Fill a chilled pressure bottle with liquid ethylene oxide from a lecture bottle, and store in a freezer when not in use. Use a small piece of polyethylene film to protect the liquid from contact with the rubber gasket. Transfer about 100 mL of chilled isopropyl alcohol to a 500-mL volumetric flask. Using a chilled graduated cylinder, transfer 25 mL of ethylene oxide to the isopropyl alcohol, and swirl gently to mix. Dilute with additional chilled isopropyl alcohol to volume, replace the stopper, and swirl gently to mix. This stock solution contains about 43.6 mg/mL of ethylene oxide.

Standard solutions: Pipet 25 mL of 0.5 N alcoholic hydrochloric acid, prepared by mixing 45 mL of hydrochloric acid with 1 L of alcohol, into a 500-mL conical flask containing 40 g of magnesium chloride hexahydrate. Shake the mixture to effect saturation. Pipet 10 mL of the *Standard stock solution* into the flask, and add 20 drops of bromocresol green TS. If the solution is not yellow (acid), add an additional volume, accurately measured, of 0.5 N alcoholic hydrochloric acid to give an excess of about 10 mL. Record the total volume of 0.5 N alcoholic hydrochloric acid added. Insert the stopper into the flask, and allow to stand for 30 min. Titrate the excess acid with 0.5 N alcoholic potassium hydroxide VS. Perform a blank titration, using 10.0 mL of isopropyl alcohol instead of *Standard stock solution*, adding the same total volume of 0.5 N alcoholic hydrochloric acid, and note the difference in volumes required. Each mL of the difference in volumes of 0.5 N alcoholic potassium hydroxide consumed is equivalent to 22.02 mg of ethylene oxide. Calculate the concentration, in mg/mL, of ethylene oxide in the *Standard stock*

solution. Standardize daily. Store in a refrigerator. Prepare a 1000-ppm standard by pipeting into a container the calculated volume (about 2 mL) of cold *Standard stock solution* that on the basis of the standardization contains 88.6 mg of ethylene oxide, and adding 87.0 g of *Stripped octoxynol 9*. Prepare 10-, 5-, and 0.5-ppm standards by quantitatively diluting the 1000-ppm standard with additional *Stripped octoxynol 9*.

Standard solution 0.5 ppm: Transfer 5 ± 0.01 g of the *Standard solution* containing 0.5 ppm ethylene oxide to suitable serum vials equipped with pressure-tight septum closures designed to relieve any excessive pressure, and seal.

Standard solution 5 ppm: Transfer 5 ± 0.01 g of the *Standard solution* containing 5 ppm ethylene oxide to suitable serum vials equipped with pressure-tight septum closures designed to relieve any excessive pressure, and seal.

Standard solution 10 ppm: Transfer 5 ± 0.01 g of the *Standard solution* containing 10 ppm ethylene oxide to suitable serum vials equipped with pressure-tight septum closures designed to relieve any excessive pressure, and seal.

Sample solution: Transfer 5 ± 0.01 g of Octoxynol 9 to a serum vial of the same kind as the vials used for the *Standard solutions*.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2.1-mm \times 6.4-m nickel; 60- to 80-mesh support S9

Temperatures

Column: 100°

Injection port: 160°

Detector: 200°

Carrier gas: Helium

Flow rate: 30 mL/min

Injection volume: 100 µL

System suitability

Samples: *System suitability solution*, *Standard solution 0.5 ppm*, *Standard solution 5 ppm*, and *Standard solution 10 ppm*

Suitability requirements

Resolution: NLT 1.5 between ethylene oxide and acetaldehyde, *System suitability solution*

Calibration: None of the points used for constructing the *Calibration curve* deviates from the line by more than 10%.

Analysis

Samples: *System suitability solution*, *Standard solution 0.5 ppm*, *Standard solution 5 ppm*, *Standard solution 10 ppm*, and *Sample solution*

Calibration curve: Place the vial containing *Standard solution 10 ppm* in an oven, and heat at 90° for 30 min. Remove the vial from the oven. Using a gas-tight syringe, immediately inject the headspace gas into the chromatograph. Obtain the area for the ethylene oxide peak (retention time approximately 8 min). Raise the temperature of the column to 200° after ethylene oxide elutes to volatilize heavy components. Re-equilibrate the column at 100°. Repeat the foregoing steps, using the vials containing *Standard solution 0.5 ppm* and *Standard solution 5 ppm*. On linear graph paper, plot area versus ppm ethylene oxide for the standards, and draw the best straight line through the points.

Place the vial containing the *Sample solution* in an oven, and heat at 90° for 30 min. Remove the vial from the oven. Immediately inject the headspace gas into the gas chromatograph, and obtain the area for the ethylene oxide peak.

Calculate the concentration of ethylene oxide in the sample, in ppm:

$$\text{Result} = r_U \times S$$

r_U = peak area from the *Sample solution*
 S = slope of the standard curve (ppm/peak area unit)

Acceptance criteria: NMT 5 ppm

• **LIMIT OF DIOXANE**

Apparatus: Assemble a closed-system vacuum distillation apparatus, using glass vacuum stopcocks (A, B, and C), as shown in Figure 1. The concentrator tube (D)¹ is made of borosilicate or quartz (not flint) glass, graduated precisely enough to measure the 0.9 mL or more of distillate collected and marked so that the analyst can dilute accurately to 2.0 mL.

Figure 1. Closed-system vacuum distillation apparatus for dioxane.

Standard solution: 100 µg/mL of dioxane in water. Use a freshly prepared solution.

Sample solution: Transfer 20.0 g to a 50-mL round-bottom flask (E) having a 24/40 ground-glass neck joint. Add 1.0 mL of water. Place a small polytetrafluoroethylene-covered stirring bar in the flask, insert the stopper, and stir to mix. Immerse the flask in an ice bath, and chill for 1 min. Wrap heating tape around the tube connecting the concentrator tube (D) and the round-bottom flask, and apply 10 V to the tape. Apply a light coating of high-vacuum silicone grease to the ground-glass joints, and connect the concentrator tube to the 10/30 joint and the round-bottom flask to the 24/40 joint. Immerse the vacuum trap in a Dewar flask filled with liquid nitrogen, close stopcocks A and B, open stopcock C, and begin evacuating the system with a vacuum pump. Prepare a slurry bath from powdered dry ice and methanol, and raise the bath to the neck of the round-bottom flask. After freezing the contents of the flask for 10 min, and when the vacuum system is operating at a 0.05-mm pressure or lower, open stopcock A for 20 s, then close it. Remove the slurry bath, and allow the flask to warm in air for 1 min. Immerse the flask in a water bath maintained at a temperature of 20°–25°, and after about 5 min warm the water bath to 35°–40° (sufficient to liquefy most specimens) while stirring slowly but constantly with the magnetic bar. Cool the water in the bath by adding ice, and chill for about 2 min. Replace the water bath with the slurry bath, freeze the contents of the round-bottom flask for 10 min, open stopcock A for 20 s, and then close it. Remove the slurry bath, and repeat the heating steps as before, this time reaching a final temperature of 45°–50° or a temperature necessary to melt the specimen completely. If there is any condensation in the tube connecting the round-bottom flask to the concentrator tube, slowly increase the voltage to the heating tape, and heat until the condensation disappears.

Stir with the magnetic stirrer throughout the following steps. Very slowly immerse the concentrator tube in a Dewar flask containing liquid nitrogen.

[CAUTION—When there is liquid distillate in the concentrator tube, immerse the tube in the liquid nitrogen very slowly, or the tube will break.]

Water will begin to distill into the concentrator tube. As ice forms in the concentrator tube, raise the Dewar flask to keep the liquid nitrogen level only slightly below the level of ice in the tube. When water begins to freeze in the neck of the 10/30 joint, or when liquid nitrogen reaches the 2.0-mL graduation mark on the concentrator tube, remove the Dewar flask, and allow the ice to melt without heating. After the ice has melted, check the volume of water that has distilled, and repeat the sequence of chilling and thawing until NLT 0.9 mL of water has been collected. Freeze the tube once again for about 2 min, and release the vacuum first by opening stopcock B, followed by opening stopcock A. Remove the concentrator tube from the apparatus, close it with a greased stopper, and allow the ice to melt without heating. Mix the contents of the concentrator tube by swirling, note the volume of distillate, and dilute with water to 2.0 mL, if necessary.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 1.8-m glass; support S10

Temperatures

Column: 140°

Injection port: 200°

Detector: 250°

Carrier gas: Nitrogen or helium

Flow rate: 35 mL/min

Install an oxygen scrubber between the carrier gas line and the column. Condition the column for 72 h at 230° with 30–40 mL/min carrier flow. [NOTE—Support S10 is oxygen-sensitive. Each time a column is installed, flush with carrier gas for 30–60 min before heating.]

Injection volume: 2–4 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: NMT 10 µg/g; the height of the peak from the *Sample solution* is NMT that from the *Standard solution*.

SPECIFIC TESTS

• **CLOUD POINT**

Sample: 1.00 g

Analysis: Weigh the *Sample* into a 250-mL beaker, and add 99 g of water. Dissolve completely by careful heating, while stirring at a constant, slow speed with a small-propeller-blade stirrer. Center a thermometer vertically in the solution, and heat rapidly until the entire solution becomes cloudy, then raise the temperature 10°. Remove the source of heat, continue stirring, and record the temperature at which the solution becomes sufficiently clear to permit seeing the entire thermometer bulb plainly.

Acceptance criteria: 63°–69°

• **FATS AND FIXED OILS, Hydroxyl Value** (401): 85–101

• **WATER DETERMINATION, Method I** (921): NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** (11)

USP Octoxynol 9 RS

¹ A suitable tube is available as Chromaflex concentrator tube, Kontes Glass Co., Vineland, NJ (Catalog No. K42560-0000).

Octyldodecanol

DEFINITION

Octyldodecanol contains NLT 90.0% of 2-octyldodecanol, the remainder consisting chiefly of related alcohols.

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the major peak of the *System suitability solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

System suitability solution: 9 mg/mL of USP Octyldodecanol RS and 1 mg/mL of USP Stearyl Alcohol RS in alcohol

Sample solution: 9 mg/mL of Octyldodecanol in alcohol

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 2-m; packed with 3% liquid phase G2 on support S1A

Oleic Acid

C₁₈H₃₄O₂

9-Octadecenoic acid, (Z)-;
Oleic acid [112-80-1].

282.46

DEFINITION

Change to read:

Oleic Acid is manufactured from fats and oils derived from edible sources, animal or vegetable, and consists chiefly of (Z)-9-octadecenoic acid [CH₃(CH₂)₇CH:CH(CH₂)₇COOH].
▲ It contains NLT 65.0% of (Z)-9-octadecenoic acid [CH₃(CH₂)₇CH:CH(CH₂)₇COOH].▲ NF31 It may contain suitable stabilizers.

[NOTE—Oleic Acid labeled solely for external use is exempt from the requirement that it be prepared from edible sources.]

IDENTIFICATION

- A. INFRARED ABSORPTION <197F>**

Sample: Undried specimen

Acceptance criteria: Meets the requirements

Add the following:

- ▲ **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.▲ NF31

Oleic Acid exhibits the composition profiles of fatty acids shown in Table 2 below, as determined in *Fats and Fixed Oils* <401>, *Fatty Acid Composition*.

Test solution: Prepare as directed in the chapter, but omitting the initial hydrolysis.

Table 2

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
14	0	≤5.0
16	0	≤16.0
16	1	≤8.0
18	0	≤6.0
18	1	≥65.0
18	2	≤18.0

▲ The sum of these fatty acids should be NMT 4.0%.

Table 2 (Continued)

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
18	3	≤4.0
20, 22 ^a	0	≤4.0

^a The sum of these fatty acids should be NMT 4.0%.

▲ NF31

- **CONGEALING TEMPERATURE** <651>: 3°–10° for Oleic Acid derived from animal sources; 10°–16° for Oleic Acid derived from vegetable sources
- **FATS AND FIXED OILS**, Acid Value <401>: 196–204, 2 g being used

Change to read:

- **FATS AND FIXED OILS**, Iodine Value <401>: ▲ 85–105▲ NF31

Add the following:

- ▲ • **FATS AND FIXED OILS**, Peroxide Value <401>: NMT 10.0▲ NF31

Add the following:

- ▲ • **WATER DETERMINATION**, Method I <921>: NMT 0.4%▲ NF31

• **MINERAL ACIDS**

Sample: 5 mL

Analysis: Shake the Sample with an equal volume of water at a temperature of about 25° for 2 min, allow the liquids to separate, and pass the water layer through a paper filter previously moistened with water.

Acceptance criteria: The filtrate is not reddened by the addition of 1 drop of methyl orange TS.

Delete the following:

▲ • **NEUTRAL FAT OR MINERAL OIL**

Sample: 1 mL

Analysis: Boil the Sample with 500 mg of sodium carbonate and 30 mL of water in a 250-mL flask.

Acceptance criteria: The resulting solution, while hot, is clear or, at most, opalescent.▲ NF31

ADDITIONAL REQUIREMENTS

Change to read:

- **PACKAGING AND STORAGE**: ▲ Preserve in well-closed containers, protected from light. Store at room temperature, and avoid exposure to excessive heat.▲ NF31
- **LABELING**: If it is for external use only, the labeling so indicates. Label it to indicate whether it is derived from animal or vegetable sources. Indicate the names and quantity of any added stabilizers.
- **USP REFERENCE STANDARDS** <11>
 USP Oleic Acid RS

Oleoyl Polyoxylglycerides**DEFINITION**

Oleoyl Polyoxylglycerides is a mixture of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols. Polyethylene glycols used have a mean molecular weight between 300 and 400. The article is produced by partial alcoholysis of unsaturated oils, mainly containing triglycerides of oleic acid with polyeth-

ylene glycol, by esterification of glycerol and polyethylene glycol with fatty acids, or as a mixture of glycerol esters and ethylene oxide condensate with the fatty acids of the unsaturated oils. It may contain free polyethylene glycols.

IDENTIFICATION

• A. INFRARED ABSORPTION (197F)

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: 50 mg/mL of USP Oleoyl Polyoxylglycerides RS in methylene chloride

Sample solution: 50 mg/mL of Oleoyl Polyoxylglycerides in methylene chloride

Application volume: 10 µL

Developing solvent system: Ether and hexanes (70:30)

Spray reagent: 0.1 mg/mL of rhodamine B in alcohol

Analysis: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Then spray the plate with *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.

Acceptance criteria: The R_f values of the principal spots from the *Sample solution* correspond to those from the *Standard solution*.

• C. It meets the requirements in *Specific Tests* (see *Table 2*) for *Fats and Fixed Oils, Fatty Acid Composition* (401).

IMPURITIES

• HEAVY METALS, *Method II* (231): NMT 10 µg/g

• ALKALINE IMPURITIES

Sample: 5.0 g

Analysis: To the *Sample* add 10 mL of alcohol and 0.05 mL of bromophenol blue TS, and mix well. Titrate with 0.01 N hydrochloric acid VS to change the color to yellow.

Acceptance criteria: NMT 1.0 mL of 0.01 N hydrochloric acid is required.

• LIMIT OF FREE ETHYLENE OXIDE AND DIOXANE

[CAUTION—Ethylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated fume hood, using great care. Protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at 4°–8°.]

[NOTE—Perform all determinations three times.]

Magnesium chloride solution: 500 mg/mL of magnesium chloride in alcohol

Ethylene oxide stock solution: Into a dry, clean test tube, cooled in a mixture of sodium chloride and crushed ice (1:3), introduce a slow current of ethylene oxide gas, allowing condensation onto the inner wall of the test tube. Using a glass syringe, previously cooled to –10°, transfer 300 µL of liquid ethylene oxide, equivalent to 0.25 g, to 50 mL of polyethylene glycol 200. Determine the absorbed quantity of ethylene oxide by weighing before and after absorption. Dilute with polyethylene glycol 200 to 100.0 mL.

Standardize this solution by transferring 10.0 mL of *Magnesium chloride solution* and 20.0 mL of 0.1 M alcoholic hydrochloric acid VS to a volumetric flask. Insert the stopper, shake to obtain a saturated solution, and allow to equilibrate overnight. Transfer 5.00 mL of *Ethylene oxide stock solution* to the flask, and allow to stand for 30 min. Titrate with 0.1 M alcoholic potassium hydroxide VS. Perform a blank titration, using the same quantity of polyethylene glycol 200 instead of *Ethylene oxide stock solution*, and note the difference in volumes required. Each mL of the difference in volumes of 0.1 M alcoholic potassium hydroxide VS consumed is equivalent to 4.404 mg of ethylene oxide. Calculate the concentration of ethylene oxide in the *Ethylene oxide stock solution*.

Ethylene oxide solution: Prepare immediately before use. Dilute a volume of *Ethylene oxide stock solution* with

polyethylene glycol 200 to obtain a solution containing about 50 µg/g of ethylene oxide. Dilute 1.0 mL of this solution with water to 5.0 mL to obtain a solution having a concentration of 10 µg/mL of ethylene oxide.

Dioxane solution: 0.5 mg/mL of dioxane

Standard solution A: Transfer 1.0 g of Oleoyl Polyoxylglycerides to a 10-mL vial, and add 1.0 mL of *N,N*-dimethylacetamide, 0.1 mL of *Ethylene oxide solution*, and 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogeneous solution. Allow to stand at 90° for 45 min.

Standard solution B: Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL vial, add 0.1 mL of a freshly prepared 10 mg/L of acetaldehyde solution, and add 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogeneous solution.

Sample solution: Transfer 1.0 g of Oleoyl Polyoxylglycerides to a 10-mL vial, and add 1.0 mL of *N,N*-dimethylacetamide and 0.2 mL of water. Close the vial, and mix to obtain a homogeneous solution. Allow to stand at 90° for 45 min.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[NOTE—Headspace apparatus that automatically transfers a measured amount of headspace may be used.]

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m glass or quartz capillary, bonded with a 1.0-µm layer of phase G1

Temperatures

Injection port: 150°

Detector: 250°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	—	50	5
50	5	180	—
180	30	230	5

Carrier gas: Helium

Flow rate: 1 mL/min

Injection volume: 1 mL

System suitability

Sample: Gaseous phase of *Standard solution B*

[NOTE—The relative retention times for acetaldehyde and ethylene oxide are about 0.94 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between acetaldehyde and ethylene oxide

Relative standard deviation: NMT 15.0%

Analysis

Samples: *Standard solution A* and *Sample solution*

Using a heated, gas-tight gas chromatographic syringe, separately inject equal volumes of the gaseous headspace of *Standard solution A* and of the *Sample solution* into the chromatograph, record the chromatograms, and measure the peak responses. [NOTE—Adjust the sensitivity of the system so that the heights of the two principal peaks are NLT 15% of the full scale of the recorder.]

Calculate the concentration of ethylene oxide in the sample taken:

$$\text{Result} = \{(C \times r_U) / [(r_S \times M_U) - (r_U \times M_S)]\}$$

C = concentration of ethylene oxide in *Standard solution A* (µg/mL)

r_U = peak response of ethylene oxide from the *Sample solution*

- r_s = peak response of ethylene oxide from *Standard solution A*
 M_U = quantity of Oleoyl Polyoxylglycerides taken to prepare the *Sample solution* (g)
 M_S = quantity of Oleoyl Polyoxylglycerides taken to prepare *Standard solution A* (g)

Calculate the concentration of dioxane in the sample taken:

$$\text{Result} = C_D \times d_U/5 \times [(d_S \times M_U) - (d_U \times M_S)]$$

- C_D = concentration of dioxane in *Standard solution A* ($\mu\text{g/mL}$)
 d_U = peak response of dioxane from the *Sample solution*
 d_S = peak response of dioxane from *Standard solution A*
 M_U = quantity of Oleoyl Polyoxylglycerides taken to prepare the *Sample solution* (g)
 M_S = quantity of Oleoyl Polyoxylglycerides taken to prepare *Standard solution A* (g)

Acceptance criteria

Ethylene oxide: NMT 1 $\mu\text{g/g}$; the peak area of ethylene oxide from the *Sample solution* is NMT half the corresponding peak area from *Standard solution A*.

Dioxane: NMT 10 $\mu\text{g/g}$; the peak area of dioxane from the *Sample solution* is NMT half the corresponding peak area from *Standard solution A*.

• LIMIT OF FREE GLYCEROL

Sample: 1.2 g

Periodic acetic acid solution: Dissolve 0.446 g of sodium periodate in 2.5 mL of a 25% (v/v) solution of sulfuric acid, and dilute to 100.0 mL with glacial acetic acid.

Potassium iodide solution: 75 mg/mL of potassium iodide

Blank: 25 mL of methylene chloride

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 M sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 25 mL of methylene chloride, heating if necessary. Cool, and add 100 mL of water and 25.0 mL of *Periodic acetic acid solution*. Shake, and allow to stand for 30 min. Add 40 mL of *Potassium iodide solution*, and allow to stand for 1 min. Add 1 mL of starch TS, and titrate the liberated iodine with 0.1 M sodium thiosulfate VS. Perform a blank determination, and make any necessary correction.

Calculate the percentage of glycerol in the sample taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

- V_S = *Titrant* volume consumed by the *Sample* (mL)
 V_B = *Titrant* volume consumed by the *Blank* (mL)
 N = actual normality of the *Titrant* (mEq/mL)
 F = equivalency factor, 23.0 mg/mEq
 W = *Sample* weight (mg)

Acceptance criteria: NMT 5.0%

SPECIFIC TESTS

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>: NMT 0.1%
- **FATS AND FIXED OILS, Acid Value** <401>
Sample: 2.0 g
Acceptance criteria: NMT 2.0
- **FATS AND FIXED OILS, Fatty Acid Composition** <401>: Oleoyl Polyoxylglycerides exhibits the composition profile of fatty acids shown in *Table 2*.

Table 2

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
16	0	4.0–9.0
18	0	≤ 6.0
18	1	58.0–80.0
18	2	15.0–35.0
18	3	≤ 2.0
20	0	≤ 2.0
20	1	≤ 2.0

- **FATS AND FIXED OILS, Hydroxyl Value** <401>
Sample: 1.0 g
Acceptance criteria: 45–65
- **FATS AND FIXED OILS, Iodine Value** <401>: 75–95
- **FATS AND FIXED OILS, Peroxide Value** <401>
Sample: 2.0 g
Acceptance criteria: NMT 12.0
- **FATS AND FIXED OILS, Saponification Value** <401>
Sample: 2.0 g
Acceptance criteria: 150–170
- **WATER DETERMINATION, Method I** <921>
Sample: 1.0 g
Analysis: Instead of using methanol as the solvent, one of two solvent systems can be used: a mixture of methylene chloride and anhydrous methanol (70:30 v/v), or anhydrous pyridine.
Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light and moisture. Store at controlled room temperature.
- **LABELING:** Label it to indicate the type and the average nominal molecular weight of polyethylene glycol used as part of the official title.
- **USP REFERENCE STANDARDS** <11>
 USP Oleoyl Polyoxylglycerides RS

Oleyl Alcohol

$\text{C}_{18}\text{H}_{36}\text{O}$
 9-Octadecen-1-ol, (Z)-;
 (Z)-9-Octadecen-1-ol [143-28-2].

268.48

DEFINITION

Oleoyl Alcohol is a mixture of unsaturated and saturated high molecular weight fatty alcohols consisting chiefly of oleyl alcohol ($\text{C}_{18}\text{H}_{36}\text{O}$).

SPECIFIC TESTS

• CLOUD POINT

Analysis: Place 60 g in a 150-mL beaker, heat to 30°, cool, and immerse the beaker in an ice-water bath with the surfaces of the water and the test specimen at the same level. Insert a thermometer, and, using it as a stirring rod, begin stirring rapidly and steadily when the temperature falls below 20°. Keep the thermometer immersed throughout the test, remove and inspect the beaker containing the test specimen at regular intervals, and record the temperature at which the immersed portion of the thermometer, positioned vertically in the center of the beaker, is no longer visible when viewed horizontally through the beaker and test specimen.

- Acceptance criteria: The cloud point is not above 10°.
- **REFRACTIVE INDEX** (831): 1.458–1.460
 - **FATS AND FIXED OILS**, *Acid Value* (401): NMT 1
 - **FATS AND FIXED OILS**, *Hydroxyl Value* (401): 205–215
 - **FATS AND FIXED OILS**, *Iodine Value* (401): 85–95

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-filled, tight containers, and store at controlled room temperature.

Oleyl OleateC₃₆H₆₈O₂

532.92

9-Octadecenoic acid, (Z)-, oleyl ester;
Oleyl oleate [3687-45-4].

DEFINITION

Oleyl Oleate consists of esters of oleyl alcohol and high molecular weight fatty acids, principally oleic acid.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)

IMPURITIES

- **RESIDUE ON IGNITION** (281)
Sample: 2 g
Acceptance criteria: NMT 0.1%
- **ARSENIC**, *Method II* (211): 2 µg/g
- **HEAVY METALS**, *Method II* (231): NMT 20 µg/g

SPECIFIC TESTS

- **CLARITY OF SOLUTION**
Sample solution: 200 mg/mL in ether
Acceptance criteria: The resulting solution is clear.
- **SPECIFIC GRAVITY** (841): 0.860–0.884 at 20°
- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 3.0
- **FATS AND FIXED OILS**, *Hydroxyl Value* (401): NMT 10
- **FATS AND FIXED OILS**, *Iodine Value* (401): 70–120
- **FATS AND FIXED OILS**, *Saponification Value* (401): 90–125
- **REFRACTIVE INDEX** (831): 1.464–1.468 at 20°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage conditions specified.
- **USP REFERENCE STANDARDS** (11)
USP Oleyl Oleate RS

Olive Oil

[8001-25-0].

DEFINITION

Olive Oil is the refined fixed oil obtained from the ripe fruit of *Olea europaea* Linné (Fam. Oleaceae). It may contain suitable antioxidants.

IDENTIFICATION

- It meets the requirements for *Fats and Fixed Oils*, *Fatty Acid Composition* (401).

IMPURITIES**Inorganic Impurities**

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm
- **ALKALINE IMPURITIES**

Sample: 10 mL of Olive Oil

Analysis: Mix 10 mL of freshly opened acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. Add the Sample, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow.

Acceptance criteria: NMT 0.1 mL of 0.01 N hydrochloric acid is required.

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Fatty Acid Composition* (401): Olive Oil exhibits the following composition profile of fatty acids.

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
<16	0	≤0.1
16	0	7.5–20.0
16	1	≤3.5
18	0	0.5–5.0
18	1	56.0–85.0
18	2	3.5–20.0
18	3	≤1.2
20	0	≤0.7
20	1	≤0.4
22	0	≤0.2
24	0	≤0.2

ABSENCE OF SESAME OIL

Sample: 10 mL of Olive Oil

Analysis: Mix the Sample with a mixture of 0.5 mL of a 0.35% (v/v) solution of furfural in acetic anhydride and 4.5 mL of acetic anhydride, and shake the mixture for about 1 min. Pass through a filter paper previously wetted with acetic anhydride. Add 0.2 mL of sulfuric acid to the filtrate.

Acceptance criteria: No bluish-green color develops.

- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 0.3. [NOTE—Petroleum ether with 100–120° boiling range can be used to replace ether in the test.]
- **FATS AND FIXED OILS**, *Peroxide Value* (401): NMT 10.0.
- **FATS AND FIXED OILS**, *Unsaponifiable Matter* (401): NMT 1.5%. [NOTE—Petroleum ether with 40–60° boiling range can be used to replace ether in the test.]

SPECIFIC ABSORBANCE

Sample solution: Dissolve 1.0 g of Olive Oil in cyclohexane, and dilute with cyclohexane to 100 mL.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Wavelength: 270 nm

Analysis: Determine the UV-Vis absorbance using the *Spectrometric conditions* described above.

Acceptance criteria: The absorbance is NMT 1.20.

- **WATER DETERMINATION**, *Method 1c* (921): NMT 0.1%
- **FATS AND FIXED OILS**, *Sterol Composition* (401): Olive Oil exhibits the following composition profiles of sterols.

Component	Percentage (%)
Cholesterol	≤0.5
Campesterol	≤4.0
Δ7-Stigmastenol	≤0.5
Sum of the contents of Δ5,23-stigmastadienol, clerosterol, β-sitosterol, sitostanol, Δ5-avenasterol, and Δ5,24-stigmastadienol	≥93.0

The content of stigmasterol is not greater than that of campesterol.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant, well-filled containers, and prevent exposure to excessive heat.
- **LABELING:** Label it to indicate the name and quantity of any suitable antioxidants.

Vehicle for Oral Solution

DEFINITION

Prepare Vehicle for Oral Solution as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Sucrose	80 g
Glycerin	5 g
Sorbitol	5 g
Sodium Phosphate, Dibasic	120 mg
Citric Acid	200 mg
Potassium Sorbate	100 mg
Methylparaben	100 mg
Purified Water, a sufficient quantity to make	100 mL

Calculate the quantity of each ingredient required for the total amount to be prepared. Accurately weigh/measure each ingredient. Heat about 30 mL of *Purified Water* to 70°–75°. Add the *Glycerin* and *Methylparaben*, and stir until the *Methylparaben* is dissolved. Add the *Dibasic Sodium Phosphate*, *Citric Acid*, *Potassium Sorbate*, and *Sorbitol*, and mix well. Add the *Sucrose*, and mix until dissolved; remove from the heat, and allow to cool. Add sufficient *Purified Water* to volume, and mix well. Adjust the pH if necessary. Package, and label.

SPECIFIC TESTS

- **pH** <791>: An apparent pH between 4.0 and 5.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in a tight, light-resistant container, and store at controlled room temperature.
- **LABELING:** Label it to indicate that it is for use in compounding oral solutions and suspensions.
- **BEYOND-USE DATE:** NMT 6 months after preparation. A beyond-use date of more than 6 months may be assigned if supporting stability data exist. (See *Stability Criteria and Beyond-Use Dating* in *Pharmaceutical Compounding—Nonsterile Preparations* <795>.)

Vehicle for Oral Solution, Sugar Free

DEFINITION

Prepare Vehicle for Oral Solution, Sugar Free as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Xanthan Gum	50 mg
Glycerin	10 mL
Sorbitol Solution	25 mL
Saccharin Sodium	100 mg
Citric Acid Monohydrate	1.5 g
Sodium Citrate	2 g
Methylparaben	100 mg
Potassium Sorbate	100 mg
Purified Water, a sufficient quantity to make	100 mL

Calculate the quantity of each ingredient required for the total amount to be prepared. Accurately weigh/measure each ingredient. Heat about 60 mL of *Purified Water* to about 70°–75°. Add the *Methylparaben*, and stir until dissolved. Remove from the heat, and add the *Glycerin*, *Sorbitol Solution*, *Saccharin Sodium*, *Citric Acid Monohydrate*, *Sodium Citrate*, *Potassium Sorbate*, and *Xanthan Gum*. Add sufficient *Purified Water* to volume, and mix well. Adjust the pH if necessary. Package, and label.

SPECIFIC TESTS

- **pH** <791>: An apparent pH between 4.0 and 5.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in a tight, light-resistant container, and store at controlled room temperature.
- **LABELING:** Label it to indicate that it is for use in compounding sugar-free oral solutions and suspensions.
- **BEYOND-USE DATE:** NMT 6 months after preparation. A beyond-use date of more than 6 months may be assigned if supporting stability data exist. (See *Stability Criteria and Beyond-Use Dating* in *Pharmaceutical Compounding—Nonsterile Preparations* <795>.)

Vehicle for Oral Suspension

DEFINITION

Prepare Vehicle for Oral Suspension as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Cellulose, Microcrystalline	800 mg
Xanthan Gum	200 mg
Carrageenan	150 mg
Carboxymethylcellulose Sodium (High Viscosity)	25 mg
Citric Acid	250 mg
Sodium Phosphate, Dibasic	120 mg
Simethicone	0.1 mL
Potassium Sorbate	100 mg
Methylparaben	100 mg
Purified Water, a sufficient quantity to make	100 mL

Calculate the quantity of each ingredient required for the total amount to be prepared. Accurately weigh/measure each ingredient. Heat about 90 mL of the *Purified Water* to 70°–75°. Dissolve the *Methylparaben*, followed by the *Citric Acid*, *Dibasic Sodium Phosphate*, and *Potassium Sorbate* in the heated water. Remove from the heat. With constant mixing, slowly sprinkle the *Microcrystalline Cellulose*, *Xanthan Gum*, *Carrageenan*, and *Carboxymethylcellulose Sodium* into the mixture. Continue to stir until fully hydrated, add the *Simethicone*, and mix well. Add sufficient *Purified Water* to volume, and mix well. Adjust the pH if necessary. Package, and label.

SPECIFIC TESTS

- **pH** <791>: An apparent pH between 4.0 and 5.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in a tight, light-resistant container, and store at controlled room temperature.
- **LABELING:** Label it to indicate that it is for use in compounding oral solutions and suspensions.
- **BEYOND-USE DATE:** NMT 6 months after preparation. A beyond-use date of more than 6 months may be assigned if supporting stability data exist. (See *Stability Criteria and Beyond-Use Dating* in *Pharmaceutical Compounding—Nonsterile Preparations* <795>.)

Orange Oil

DEFINITION

Orange Oil is the volatile oil obtained by expression from the fresh peel of the ripe fruit of *Citrus sinensis* (L.) Osbeck (Fam. Rutaceae). The total aldehyde content, calculated as decanal (C₁₀H₂₀O), is NLT 1.2% and NMT 2.5%. It may contain a suitable antioxidant.

[NOTE—Do not use Orange Oil that has a terebinthine odor.]

ASSAY

• TOTAL ALDEHYDE CONTENT

Reagent solution: Dissolve 4.5 g of hydroxylamine hydrochloride in 13 mL of water. Add 85 mL of tertiary butyl alcohol, mix, and adjust with 0.5 N potassium hydroxide to a pH of 3.4.

Sample: 5 mL of Oil

Analysis: Pipet 50 mL of the *Reagent solution* into a conical flask containing the *Sample*. Insert the stopper in the flask, and allow to stand at room temperature for 30 min, with occasional shaking. Titrate the liberated hydrochloric acid with 0.5 N alcoholic potassium hydroxide VS to a pH of 3.4. Each mL of 0.5 N alcoholic potassium hydroxide consumed in the titration is equivalent to 78.13 mg of total aldehydes, calculated as decanal (C₁₀H₂₀O).

Acceptance criteria: 1.2%–2.5%

IMPURITIES

- **HEAVY METALS, Method II <231>:** NMT 40 µg/g

SPECIFIC TESTS

- **SPECIFIC GRAVITY <841>:** 0.842–0.846
- **OPTICAL ROTATION, Angular Rotation <781A>:** +94° to +99°
- **REFRACTIVE INDEX <831>:** 1.472–1.474 at 20°
- **ULTRAVIOLET ABSORBANCE**

Sample solution: 250 mg of Oil in 100 mL of alcohol
Blank: Alcohol

Instrumental conditions

(See *Spectrophotometry and Light-Scattering <851>*.)

Mode: UV-Vis

Wavelength range: 260–400 nm

Analysis: Record the spectrum in 1-cm cell. Determine the absorbance at the wavelength of maximum absorbance at 330 nm, using the line drawn tangent to the curves appearing as minima in the spectrum in wavelength regions above and below the maximum wavelength as the baseline.

Acceptance criteria: The absorbance, calculated on the basis of a 250-mg specimen, is NLT 0.130 for California-type Orange Oil or NLT 0.240 for Florida-type Orange Oil.

• FOREIGN OILS

Analysis: Place 50 mL of Oil in a four-bulb Ladenburg flask having the following dimensions: the lower or main bulb is about 6 cm in diameter, and the smaller condensing bulbs are about 3.5, 3.0, and 2.5 cm in diameter; the distance from the bottom of the flask to the side-arm is about 20 cm. Distill Oil at a rate of 1 drop/s until the distillate measures 5 mL.

Acceptance criteria: The angular rotation of the distillate does not differ from that of the original Oil by more than 2°, and the refractive index at 20° is 0.001–0.002 lower than that of the original Oil.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-filled, tight containers, and avoid exposure to excessive heat.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived. Label it also to indicate whether it is California-type or Florida-type Orange Oil.

The label indicates that Oil is not to be used if it has a terebinthine odor.

Compound Orange Spirit

DEFINITION

Compound Orange Spirit contains NLT 25 mL and NMT 30 mL of the mixed oils in 100 mL of Spirit.

Prepare Compound Orange Spirit as follows (see *Pharmaceutical Compounding—Nonsterile Preparations <795>*).

Orange Oil	200 mL
Lemon Oil	50 mL
Coriander Oil	20 mL
Anise Oil	5 mL
Alcohol, a sufficient quantity to make	1000 mL

Mix the oils with sufficient *Alcohol* to make the product measure 1000 mL.

ASSAY

• PROCEDURE

Sample solution: Transfer 2.0 mL of Compound Orange Spirit and 1.0 mL of kerosene to a Babcock bottle, graduated to 8%, and mix.

Analysis: To the *Sample solution* add sufficient saturated calcium chloride solution, acidified with hydrochloric acid, to almost fill the bulb of the bottle. Rotate the bottle vigorously to ensure mixing, then add a sufficient quantity of the calcium chloride solution to bring the separated oil into the neck of the bottle. Centrifuge for 5 min at 1500 rpm, and read the volume of oil in the stem. Subtract five divisions on the volumetric flask for the kerosene added, and multiply the remaining number of divisions by 10.5 to obtain the volume, in mL, of mixed oils in 100 mL of the Compound Orange Spirit.

Acceptance criteria: 25–30 mL

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I <611>:** 65.0%–70.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers, protected from light, and store in a cold place.

Sweet Orange Peel Tincture

DEFINITION

Sweet Orange Peel Tincture is prepared from sweet orange peel, which is the outer rind of the non-artificially colored, fresh, ripe fruit of *Citrus sinensis* (L.) Osbeck (Fam. Rutaceae).

Prepare Sweet Orange Peel Tincture as follows.

Sweet Orange Peel	500 g
Alcohol	900 mL
Alcohol, a sufficient quantity to make	1000 mL

Macerate the *Sweet Orange Peel* in 900 mL of *Alcohol* in a container that can be closed, and put in a warm place. Agitate it frequently during 3 days or until the soluble matter is dissolved. Transfer the mixture to a filter, using Talc as the filtering medium, and when most of the liquid has drained away, wash the residue on the filter with a sufficient quantity of *Alcohol*, combining the filtrates, to produce 1000 mL, and mix. [NOTE—Exclude the inner, white portion of the rind.]

OTHER COMPONENTS

- **ALCOHOL DETERMINATION**, *Method I* <611>: 62.0%–72.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Package in tight, light-resistant containers. Avoid exposure to direct sunlight and excessive heat.
- **LABELING**: The label states the Latin binomial and the official name.

Orange Syrup**DEFINITION**

Orange Syrup contains NLT 0.45% and NMT 0.55% of citric acid ($C_6H_8O_7$).

Prepare Orange Syrup as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Sweet Orange Peel Tincture	50 mL
Anhydrous Citric Acid	5 g
Talc	15 g
Sucrose	820 g
Purified Water, a sufficient quantity to make	1000 mL

Triturate *Talc* with *Sweet Orange Peel Tincture* and *Anhydrous Citric Acid*, and gradually add 400 mL of *Purified Water*. Filter, returning the first portions of the filtrate until it becomes clear, and wash the mortar and the filter with sufficient *Purified Water* to make the filtrate measure 450 mL. Dissolve *Sucrose* in this filtrate by agitation, without heating, and add *Purified Water* to make the product measure 1000 mL. Mix, and strain. [NOTE—Do not use Orange Syrup that has a terebinthine odor or taste or shows other indications of deterioration.]

ASSAY• **CITRIC ACID**

Sample: 20 mL

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: To the *Sample* add 20 mL of water and add phenolphthalein TS. Titrate with *Titrant*. Each mL of *Titrant* is equivalent to 6.404 mg of citric acid ($C_6H_8O_7$).

Acceptance criteria: 0.45%–0.55%

OTHER COMPONENTS

- **ALCOHOL DETERMINATION**, *Method I* <611>: 2.0%–5.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Package in tight containers, and store in a cold place.
- **LABELING**: The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived. The label indicates that Syrup is not to be used if it has a terebinthine odor or taste or shows other indications of deterioration.

Oxyquinoline Sulfate

$(C_9H_7NO)_2 \cdot H_2SO_4$

8-Quinolinol sulfate (2:1) (salt) [134-31-6].

388.39

DEFINITION

Oxyquinoline Sulfate is 8-hydroxyquinoline sulfate. It contains NLT 97.0% and NMT 101.0% of oxyquinoline sulfate $[(C_9H_7NO)_2 \cdot H_2SO_4]$, calculated on the anhydrous basis.

IDENTIFICATION• **A. INFRARED ABSORPTION** <197M>

Analysis: On the undried specimen

Acceptance criteria: Meets the requirements

• **B. IDENTIFICATION TESTS—GENERAL**, *Sulfate* <191>

Analysis: 100 mg/mL

Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Sample: 100 mg

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: 0.1 N bromine VS

Back-titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to an iodine flask, add 30 mL of glacial acetic acid, 25.0 mL of *Titrant*, 10 mL of potassium bromide solution (150 mg/mL), and 10 mL of hydrochloric acid. Immediately insert the stopper, mix, and allow to stand for 15 min, protected from light. Quickly add 10 mL of potassium iodide solution (100 mg/mL) and 100 mL of water, taking precautions against the escape of bromine vapor. At once insert the stopper, and shake the mixture thoroughly. Remove the stopper, and rinse it and the neck of the flask with a small quantity of water so that the washing flows into the flask. Shake the mixture thoroughly. Titrate the liberated iodine with *Back-titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination. Each mL of *Titrant* is equivalent to 4.855 mg of oxyquinoline sulfate $[(C_9H_7NO)_2 \cdot H_2SO_4]$.

Acceptance criteria: 97.0%–101.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.3%

- **HEAVY METALS**, *Method II* <231>: NMT 20 µg/g

SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* <921>: 4.0%–6.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>
USP Oxyquinoline Sulfate RS

Palm Oil

Palm oil [8002-75-3].

DEFINITION

Palm Oil is the refined fixed oil obtained from the pulp of the fruit of the oil palm *Elaeis guineensis* Jacq. (Fam. Arecaceae). It may contain suitable antioxidants.

IDENTIFICATION

- **A.** It meets the requirements of the test for *Fats and Fixed Oils, Fatty Acid Composition* (401).
- **B.** It meets the requirements of the test for *Melting Range or Temperature* (741).

IMPURITIES

- **RESIDUE ON IGNITION** (281)
Sample: 5 g of Palm Oil
Acceptance criteria: NMT 0.1%
- **HEAVY METALS, Method II** (231): NMT 10 µg/g
- **ALKALINE IMPURITIES**
Sample: 10 mL of Palm Oil
Analysis: Mix 10 mL of acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. If necessary, neutralize the solution to a green color with 0.01 N hydrochloric acid or 0.01 N sodium hydroxide. Add the Sample, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS until the color of the upper layer changes to yellow.
Acceptance criteria: NMT 0.1 mL of 0.01 N hydrochloric acid is required.

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 30°–40°
- **FATS AND FIXED OILS, Acid Value, Method II** (401): NMT 2.0
- **FATS AND FIXED OILS, Fatty Acid Composition** (401):
Palm Oil exhibits the composition profile of fatty acids as shown in Table 1.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage
≤12	0	≤2.5
14	0	0.5–5.9
16	0	39.0–47.0
18	0	2.0–8.0
16	1	≤0.5
18	1	36.0–44.0
18	2	7.0–12.0
18	3	≤0.5
≥20	0 or 1	≤1.0

- **FATS AND FIXED OILS, Peroxide Value** (401): NMT 5.0
- **FATS AND FIXED OILS, Unsaponifiable Matter** (401): NMT 1.0%
- **WATER DETERMINATION, Method Ic** (921): NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Do not store above 55°.
- **LABELING:** Label it to indicate the name and quantity of any added antioxidants.

Hydrogenated Palm Oil

$R^1\text{COOCH}_2\text{—CH}(\text{OOCR}^2)\text{—CH}_2\text{OOCR}^3$, where R^1 , R^2 , and R^3 are mainly C_{15} and C_{17} ;
Hydrogenated palm oil [68514-74-9].

DEFINITION

Hydrogenated Palm Oil is the product obtained by refining and hydrogenating the oil obtained from the pulp of the fruit of the oil palm *Elaeis guineensis* Jacq. (Fam. Arecaceae). The product consists mainly of triglycerides of palmitic and stearic acids.

IDENTIFICATION

- **A.** It meets the requirements of the test for *Fats and Fixed Oils, Fatty Acid Composition* (401).
- **B.** It meets the requirements of the test for *Melting Range or Temperature* (741).

IMPURITIES

- **RESIDUE ON IGNITION** (281)
Sample: 5 g
Acceptance criteria: NMT 0.1%
- **HEAVY METALS, Method II** (231): NMT 10 µg/g
- **LIMIT OF NICKEL**
Sample solution: Weigh 5.0 g of Hydrogenated Palm Oil into a previously tared platinum or silica crucible. Cautiously heat the substance, and introduce into it a wick formed from twisted, ashless filter paper. Ignite the wick. When the substance ignites, stop heating. After combustion, ignite in a muffle furnace at about 600°. Continue the incineration until a white ash is obtained. After cooling, with the aid of two 2-mL portions of diluted hydrochloric acid, transfer the residue to a 25-mL volumetric flask, add 0.3 mL of nitric acid, and dilute with water to volume.
Nickel standard solution: Immediately before use, dilute 10 mL of nickel standard solution TS with water to 500 mL. This solution contains the equivalent of 0.2 µg/mL of nickel.
Standard solutions: Into four separate identical 10-mL volumetric flasks introduce respectively 0, 1.0, 2.0, and 4.0 mL of Nickel standard solution. To each flask add a 2.0-mL portion of the Sample solution, and dilute with water to volume to obtain four Standard solutions containing added quantities of 0, 0.2, 0.4, and 0.8 µg of nickel, respectively.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a graphite furnace

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Analysis

Samples: Standard solutions
Concomitantly determine the absorbances of the Standard solutions at least three times each. Record the average of the steady readings for each of the Standard solutions. Plot the absorbances of the Standard solutions versus the added quantity, in µg, of nickel. Extrapolate the line joining the points on the graph until it meets the quantity axis. The distance between this point and the intersection of the axes represents the quantity of nickel in the 2-mL portion of the Sample solution added to the Standard solutions.

Calculate the content of nickel in the portion of Hydrogenated Palm Oil taken:

$$\text{Result} = [V \times (A/V_A)]/W$$

- V = volume of the *Sample solution*, 25 mL
 A = quantity of nickel (μg)
 V_A = volume of the *Sample solution* added to the *Standard solutions*, 2 mL
 W = weight of Hydrogenated Palm Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 1 $\mu\text{g/g}$

• ALKALINE IMPURITIES

Sample: A mixture of 2.0 g of Hydrogenated Palm Oil, 1.5 mL of alcohol, and 3.0 mL of toluene

Analysis: Dissolve the *Sample* by gentle heating. Add 0.05 mL of bromophenol blue TS, and titrate with 0.01 N hydrochloric acid VS until the mixture turns yellow.

Acceptance criteria: NMT 0.4 mL of 0.01 N hydrochloric acid is required.

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 58°–62°
- **FATS AND FIXED OILS, Acid Value, Method II** (401): NMT 2.0
- **FATS AND FIXED OILS, Fatty Acid Composition** (401): Hydrogenated Palm Oil exhibits the composition profile of fatty acids as shown in *Table 1*.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage
≤12	0	≤2.5
14	0	0.5–5.9
16	0	32.0–47.0
18	0	49.0–57.0
20	0	≤1.0
22	0	≤1.0
16	1	≤2.5
18	1	≤2.5
18	2	≤0.5
18	3	≤0.5

- **FATS AND FIXED OILS, Peroxide Value** (401): NMT 5.0
- **FATS AND FIXED OILS, Unsaponifiable Matter** (401): NMT 0.8%
- **LOSS ON DRYING** (731)
Analysis: Dry a sample at 105° for 4 h.
Acceptance criteria: NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No storage requirement specified.

Palm Kernel Oil

Elaeis guineensis seed oil [8023-79-8].

DEFINITION

Palm Kernel Oil is the refined fixed oil obtained from the kernel of the fruit of the oil palm *Elaeis guineensis* Jacq. (Fam. Arecaceae). It may contain suitable antioxidants.

IDENTIFICATION

- **A.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* (401).
- **B.** It meets the requirements in *Specific Tests for Melting Range or Temperature* (741).

IMPURITIES

• LIMIT OF LEAD

[NOTE—For this test, use reagent-grade chemicals with as low a lead content as is practicable, as well as high-purity water and gases. Before use in this analysis, rinse all glassware and plasticware twice with diluted nitric acid and twice with diluted hydrochloric acid, and then rinse them thoroughly with Purified Water.]

Hydrogen peroxide–nitric acid solution: 10% hydrogen peroxide and diluted nitric acid (1:1). [NOTE—Use caution.]

Lead nitrate stock solution: Dissolve 159.8 mg of lead nitrate in 100 mL of *Hydrogen peroxide–nitric acid solution*. Dilute with *Hydrogen peroxide–nitric acid solution* to 1000 mL, and mix. Prepare and store this solution in glass containers that are free from lead salts. Each mL of this solution contains the equivalent of 100 μg of lead.

Standard lead solution: On the day of use, dilute 10.0 mL of *Lead nitrate stock solution* with *Hydrogen peroxide–nitric acid solution* to 100.0 mL, and mix. Each mL of *Standard lead solution* contains the equivalent of 10 μg of lead.

Butanol–nitric acid solution: Slowly add 50 mL of nitric acid to approximately 500 mL of butanol in a 1000-mL volumetric flask. Dilute with butanol to volume.

Standard solutions: Into five separate 100-mL volumetric flasks pipet 0.2, 0.5, 1, 2, and 5 mL, respectively, of *Standard lead solution*, and dilute with *Butanol–nitric acid solution* to volume. The *Standard solutions* contain 0.02, 0.05, 0.1, 0.2, and 0.5 $\mu\text{g/mL}$ of lead, respectively.

Sample solution: [CAUTION—Prepare this solution in a fume hood, and wear safety glasses.] Transfer 1.0 g of Oil into a large test tube. Add 1 mL of nitric acid. Place the test tube in a rack in a boiling water bath. As soon as the rusty tint is gone, add 1 mL of 30% hydrogen peroxide dropwise to avoid a vigorous reaction, and wait for bubbles to form. Stir with an acid-washed plastic spatula if necessary. Remove the test tube from the water bath, and allow it to cool. Transfer the solution to a 10-mL volumetric flask, and dilute with *Butanol–nitric acid solution* to volume.

Tungsten solution: Transfer 0.1 g of tungstic acid and 5 g of sodium hydroxide pellets to a 50-mL plastic bottle. Add 5.0 mL of water, and mix. Heat the mixture in a hot water bath until complete solution is achieved. Cool, and store at room temperature.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Graphite furnace atomic absorption spectrophotometry

Analytical wavelength: 283.3 nm lead emission line

Injection size: 20 μL

Lamp: Lead hollow-cathode

Furnace conditioning: Place the graphite tube in the furnace. Inject the *Tungsten solution* into the graphite tube, using an argon flow rate of 300 mL/min. Maintain the drying temperature at 110° for 20 s, the ashing temperature at 700°–900° for 20 s, and with the argon flow stopped, the atomization temperature at 2700° for 10 s; repeat this process once more using a second 20- μL aliquot of the *Tungsten solution*. Clean the quartz windows.

Analysis

Samples: *Standard solutions* and *Sample solution*

[NOTE—The sample injection technique is the most crucial step in controlling the precision of the analysis; the volume of each of the *Standard solutions* and the *Sample solution* must remain constant. Rinse the μL -pipet tip three times with either the *Standard solutions* or the *Sample solution* before injection. Use a fresh pipet tip for each injection, and start the atomization process immediately after injecting the *Sam-*

ples. Between injections, flush the graphite tube of any residual lead by purging at a high temperature recommended by the manufacturer.]

Concomitantly determine the absorbances of the *Samples*.

Atomize equal volumes of the *Standard solutions* and the *Sample solution* with an argon flow rate of 300 mL/min.

Maintain the drying temperature of the furnace at 110° for 30 s after a 20-s ramp time and a 10-s hold time; the ashing temperature at 700° for 42 s after a 20-s ramp time and a 22-s hold time; and the atomization temperature at 2300° for 7 s with the argon flow stopped.

Plot the absorbance of each of the *Standard solutions*, compensated for background correction, versus its content of lead, in µg/mL, and draw the best straight line fitting the five points. From this plot, determine the concentration, *C*, in µg/mL, of lead in the *Sample solution*.

Calculate the quantity, in µg/g, of lead in the portion of Oil taken:

$$\text{Result} = (C/W) \times V$$

C = measured concentration of lead in the *Sample solution* (µg/mL)

W = weight of the Oil taken to prepare the *Sample solution* (g)

V = final volume of the *Sample solution*, 10 mL

Acceptance criteria: NMT 0.1 µg/g of lead

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 2.0
- **FATS AND FIXED OILS**, *Fatty Acid Composition* (401): Palm Kernel Oil exhibits the composition profile of fatty acids shown in Table 1.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
6	0	≤1.5
8	0	3–5
10	0	2.5–6
12	0	40–52
14	0	14–18
16	0	7–10
18	0	1–3
20	0	≤1
16	1	≤1
18	1	11–19
18	2	0.5–4

- **FATS AND FIXED OILS**, *Peroxide Value* (401): NMT 10.0
- **FATS AND FIXED OILS**, *Unsaponifiable Matter* (401): NMT 1.5%
- **MELTING RANGE OR TEMPERATURE** (741): 27°–29°
- **WATER DETERMINATION**, *Method I* (921): NMT 0.1%, 50 mL of chloroform being used instead of 35–40 mL of methanol as the solvent.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Do not store above 45°.
- **LABELING:** Label it to indicate the name and quantity of any added antioxidants.

Palmitic Acid

Hexadecanoic acid [57-10-3].

256.42

DEFINITION

Palmitic Acid is a mixture of solid organic acids obtained from fats or oils of animal or vegetable origin. It contains NLT 92.0% of palmitic acid ($\text{C}_{16}\text{H}_{32}\text{O}_2$) and NMT 6.0% of stearic acid ($\text{C}_{18}\text{H}_{36}\text{O}_2$).

IDENTIFICATION

- **A.** The retention time of the major peak for palmitic acid of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Sample solution: Proceed as directed for *Test solution* in *Fats and Fixed Oils* (401), *Fatty Acid Composition*.

Standard solution: Prepare the *Standard solution* in the same manner as the *Sample solution*, using a mixture of 50 mg of USP Palmitic Acid RS and 50 mg of USP Stearic Acid RS instead of the substance to be examined.

Chromatographic system: Prepare as directed in *Fats and Fixed Oils* (401), *Fatty Acid Composition*.

Injection size: 1 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for methyl palmitate and methyl stearate are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between methyl stearate and methyl palmitate

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $\text{C}_{16}\text{H}_{32}\text{O}_2$ in the portion of Palmitic Acid taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for methyl palmitate from the *Sample solution*

r_T = sum of the responses of all the peaks in the chromatogram except the solvent peak

Similarly, calculate the percentage of $\text{C}_{18}\text{H}_{36}\text{O}_2$ in the portion of Palmitic Acid taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for methyl stearate from the *Sample solution*

r_T = sum of the responses of all the peaks in the chromatogram except the solvent peak

Acceptance criteria: NLT 92.0% of palmitic acid ($\text{C}_{16}\text{H}_{32}\text{O}_2$) and NMT 6.0% of stearic acid ($\text{C}_{18}\text{H}_{36}\text{O}_2$)

IMPURITIES

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

SPECIFIC TESTS

- **COLOR:** Heat a sample of Palmitic Acid to 75°. The resulting liquid is not more intensely colored than a solution prepared by mixing 1.2 mL of ferric chloride CS and 0.3 mL of cobaltous chloride CS with 0.3 N hydrochloric acid to make 10 mL, and diluting 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL. Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* (631)).
- **CONGEALING TEMPERATURE** (651): 60°–66°
- **FATS AND FIXED OILS**, *Acid Value* (401): 216–220, using 1 g
- **FATS AND FIXED OILS**, *Iodine Value* (401): NMT 1. Proceed as directed in *Method I*, except use 35 mL of chloroform.

- **MINERAL ACID**

Analysis: Shake 5 g of melted Palmitic Acid with an equal volume of hot water for 2 min. Cool, and filter.
Acceptance criteria: The filtrate is not reddened by the addition of 1 drop of methyl orange TS.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.
- **LABELING:** Label it to indicate whether it is derived from animal or vegetable sources.
- **USP REFERENCE STANDARDS** <11>
 USP Palmitic Acid RS
 USP Stearic Acid RS

Paraffin

[8002-74-2].

DEFINITION

Paraffin is a purified mixture of solid saturated hydrocarbons obtained from petroleum. It may contain suitable antioxidants.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197>
Sample: Use a thin film of melted specimen.
Analysis: Ensure complete melting to avoid doublet peaks that may be observed at wavenumbers at about 1460 and 730 cm^{-1} .
Acceptance criteria: Meets the requirements
- **B.** It meets the requirements in *Specific Tests for Congealing Temperature* <651>.

IMPURITIES

- **LIMIT OF SULFUR COMPOUNDS**
Sample: 4.0 g
Analysis: To the *Sample* add 2 mL of dehydrated alcohol, and add 2 drops of a clear saturated solution of lead(II) oxide in sodium hydroxide solution (200 mg/mL). Heat the mixture at 70° for 10 min with frequent shaking, and cool.
Acceptance criteria: No dark brown color develops.
- **LIMIT OF POLYCYCLIC AROMATIC HYDROCARBONS**
Dimethyl sulfoxide: Use spectrophotometric grade dimethyl sulfoxide.
Standard solution: 7.0 $\mu\text{g/mL}$ of USP Naphthalene RS in *Dimethyl sulfoxide*. Determine the absorbance of this solution at 278 nm using *Dimethyl sulfoxide* as the blank.
Sample: 0.50 g
Instrumental conditions
 (See *Spectrophotometry and Light-Scattering* <851>.)
Mode: UV
Wavelength range: 260–350 nm
Cell: 1 cm

Analysis: Dissolve the *Sample* in 25 mL of *n*-heptane, place in a 125-mL separator with unlubricated ground-glass parts (stopper, stopcock), and mix. Add 5.0 mL of *Dimethyl sulfoxide*, and shake the mixture vigorously for 1 min. Allow to stand until two clear layers are formed. Transfer the lower layer to another 125-mL separator, add 2 mL of *n*-heptane, and shake the mixture vigorously. Allow to stand until two clear layers are formed. Separate the lower layer, and determine its absorbance using as the blank *Dimethyl sulfoxide* that previously has been shaken vigorously for 1 min with *n*-heptane in the ratio of 5 mL of *Dimethyl sulfoxide* to 25 mL of *n*-heptane.

Acceptance criteria: The absorbance at any wavelength in the specified range is not greater than one-third of the absorbance, at 278 nm, of the *Standard solution*.

SPECIFIC TESTS

- **CONGEALING TEMPERATURE** <651>: 47°–65°
- **ACIDITY**
Sample: 15 g
Analysis: Introduce the *Sample* into a suitable separator, add 30 mL of boiling water, and shake vigorously for about 1 min. Allow to cool, and draw off the separated water. To 10 mL of the filtrated aqueous layer add 0.1 mL of phenolphthalein TS.
Acceptance criteria: The solution does not produce a pink color. NMT 1.0 mL of 0.01 M sodium hydroxide is subsequently required to change the color of the indicator to pink.
- **ALKALINITY**
Sample: 10 mL of the filtrated aqueous layer obtained from the test for *Acidity*
Analysis: To the *Sample* add 0.1 mL of methyl red TS2.
Acceptance criteria: The solution produces a yellow color. NMT 0.5 mL of 0.01 M hydrochloric acid is subsequently required to change the color of the indicator to red.
- **READILY CARBONIZABLE SUBSTANCES** <271>
Standard solution: A mix of 3 mL of ferric chloride CS, 1.5 mL of cobaltous chloride CS, and 0.50 mL of cupric sulfate CS, overlaid with 5 mL of mineral oil
Sample: 5 mL, at a temperature just above the melting point
Analysis: Use a clean, dry, heat-resistant, glass-stoppered test tube, 140 \pm 2 mm in length with an outside diameter between 14.5 and 15.0 mm, and calibrated at the 5- and 10-mL liquid levels. The capacity of the tube with the stopper inserted is between 13.6 and 15.6 mL.¹ Place the *Sample* in the test tube, add 5 mL of sulfuric acid (94.5%–94.9% of H_2SO_4), and heat in a water bath at 70° for 10 min. When 5 min have elapsed, and at each successive min thereafter, remove the tube from the bath, place a finger over the stopper, and give the tube three vigorous vertical shakes over an amplitude of about 12 cm, returning the tube to the bath within 3 s after the time when it was removed therefrom.
Acceptance criteria: At the end of 10 min from the time the tube was placed in the bath, the acid (lower layer) has no more color than the *Standard solution*. If the sulfuric acid remains dispersed in the molten paraffin, the color of the emulsion is not darker than that of the *Standard solution* when shaken vigorously.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in light resistant, well-closed containers, and avoid exposure to excessive heat.
- **LABELING:** Label it to indicate the name and quantity of any antioxidants.
- **USP REFERENCE STANDARDS** <11>
 USP Naphthalene RS
 USP Paraffin RS

Synthetic Paraffin

DEFINITION

Synthetic Paraffin is synthesized by the Fischer-Tropsch process from carbon monoxide and hydrogen, which are catalytically converted to a mixture of paraffin hydrocarbons; the lower molecular weight fractions are removed by distillation, and the residue is hydrogenated and further treated by percolation through activated charcoal. This mixture may be fractionated into its components by a solvent separation method, using a suitable synthetic

¹ A suitable test tube is available from Kimble Kontes. Item number: 34-19426. Description: Nessler Tube. Contact: phone 800-682-6644, fax 856-692-6644, e-mail customglass@kimkon.com.

isoparaffinic petroleum hydrocarbon solvent. It may contain NMT 0.005% of a suitable antioxidant.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197): A thin film of it, cast from a melt onto a cesium bromide plate, exhibits a pair of very strong IR absorption peaks between 2840 cm^{-1} and 3000 cm^{-1} , a pair of moderately strong peaks between 1430 cm^{-1} and 1490 cm^{-1} , a pair of medium peaks between 720 cm^{-1} and 750 cm^{-1} , and only weak peaks at any other wavenumbers.

IMPURITIES

- **HEAVY METALS**, *Method II* (231): NMT 20 ppm

- **LIMIT OF OIL CONTENT**

Analysis: Follow ASTM Method D721-68, "Standard Test Method for Oil Content of Petroleum Waxes" (Reapproved 1987).¹

Acceptance criteria: NMT 0.5%

SPECIFIC TESTS

- **ABSORPTIVITY**

Sample solution: Transfer 50–100 mg to a 100-mL volumetric flask. Dissolve in decahydronaphthalene at 88°, dilute with the same solvent at this temperature to volume, and mix.

Blank: Decahydronaphthalene

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Analytical wavelength: 290 nm

Cell: 10 cm (jacketed cells maintained at 88°)

Analysis

Samples: *Sample solution* and *Blank*

Determine the absorbance of the *Sample solution*, and calculate the absorptivity.

Acceptance criteria: NMT 0.01

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The labeling indicates its congealing temperature, viscosity, and needle penetration range under the specified conditions.

Peanut Oil

[8002-03-7].

DEFINITION

Peanut Oil is the fully-refined (alkali-refined, bleached, and deodorized at 230°–260°) oil obtained from the seed kernels of one or more of the cultivated varieties of *Arachis hypogaea* Linné (Fam. Leguminosae). It may contain suitable antioxidants.

IDENTIFICATION

- It meets the requirements for *Fats and Fixed Oils, Fatty Acid Composition* (401).

IMPURITIES

Inorganic Impurities

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

- **ALKALINE IMPURITIES**

Sample: 10 mL of Peanut Oil

Analysis: Mix 10 mL of freshly opened acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. Add the *Sample*, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow.

¹ Available from the American Society for Testing and Materials, 1916 Race St, Philadelphia, PA 19103.

Acceptance criteria: NMT 0.1 mL of 0.01 N hydrochloric acid is required.

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Fatty Acid Composition* (401): Peanut Oil exhibits the following fatty acid composition profile.

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
<14	0	≤0.1
14	0	≤0.2
16	0	7.0–16.0
16	1	≤1.0
18	0	1.3–6.5
18	1	35.0–72.0
18	2	13.0–43.0
18	3	≤0.6
20	0	0.5–3.0
20	1	0.5–2.1
22	0	1.0–5.0
22	1	≤0.5
24	0	0.5–3.0

- **RANCIDITY**

Sample: 1 mL of a solution (1 in 10) of Oil in ether

Analysis: Shake the *Sample* with 1 mL of hydrochloric acid, and add 1 mL of a solution (1 in 1000) of phloroglucinol in ether.

Acceptance criteria: No red or pink color develops.

- **FATS AND FIXED OILS**, *Acid Value* (401): NMT 0.2

- **FATS AND FIXED OILS**, *Peroxide Value* (401): NMT 5.0

- **FATS AND FIXED OILS**, *Unsaponifiable Matter* (401): NMT 1.5%

- **WATER DETERMINATION**, *Method Ic* (921): NMT 0.1%.

- **OTHER REQUIREMENTS:** For Peanut Oil intended for use in injectable dosage forms, which is specified in the *Labeling*, the requirements under *Injections* (1), *Ingredients*, *Other Vehicles*, must be met.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and prevent exposure to excessive heat.
- **LABELING:** Label it to indicate the name and quantity of any added antioxidant. Where Peanut Oil is intended for use in the manufacture of injectable dosage forms, it is so labeled.

Pectin—see *Pectin General Monographs*

Peppermint

DEFINITION

Peppermint consists of the dried leaf and flowering top of *Mentha piperita* L. (Fam. Labiatae).

SPECIFIC TESTS

- **ARTICLES OF BOTANICAL ORIGIN**, *Foreign Organic Matter* (561): NMT 2.0% of stems more than 3 mm in diameter

and other foreign organic matter

- **BOTANIC CHARACTERISTICS**

Unground peppermint: Leaves, slender stems, and flowering tops. The leaves are opposite, usually more or less crumpled, and frequently detached from the stem. The petiole is 4–15 mm in length, slightly pubescent; the blade, when entire, is ovate-oblong to oblong-lanceolate, 1.5–9 cm in length with an acute apex, a narrowed or rounded base, and a sharply serrate margin; light green to dark green in color; its upper surface

is nearly glabrous, its lower surface has a few hairs on the veins and many amber-colored glandular hairs. The stem is quadrangular, 1–3 mm in diameter, glabrous except for a few scattered deflexed hairs, green to dark purple. The flowers occur as a compact, oblong or oval spike of verticillasters, 1–1.5 cm in breadth, rounded at the summit, and in fruit attaining a length of 3–7 cm. The bracts are oblong-lanceolate, 4–7 mm in length; the calyx, tubular-campanulate, equally five-toothed, pubescent, and glandular-punctate, green to dark purple; the corolla is glabrous, light purple, tubular-campanulate, four-cleft, 3 mm in length; stamens, 4, short and equal; style two- or rarely three-cleft at the summit. The nutlets are ellipsoidal, 500 μ m in diameter. Peppermint has an aromatic, characteristic odor and a pungent taste, and produces a cooling sensation in the mouth.

Histology

Leaf: The lamina is dorsiventral. Both the upper and the lower epidermis consist of epidermal cells with wavy, anticlinal walls and stomata, the latter enclosed by a pair of subsidiary cells with a common wall at right angles to the guard cells. Many of the epidermal cells, especially over the veins and midrib, bear nonglandular and glandular hairs. The nonglandular hairs, also numerous along the margin, are uniseriate with longitudinally striate and papillose cuticle, up to 8 cells in length and tapered to a pointed apex. The glandular hairs occur in two types. The larger of these are sunken in depressions of the epidermis and consist of a one- to two-celled stalk and a glandular head of 8 radiating cells beneath the raised cuticle of which volatile oil is secreted. The smaller type of glandular hair consists of a one- to two-celled stalk and a one-celled glandular head containing volatile oil. Beneath the upper epidermis occurs a single layer of palisade parenchyma up to 80 μ m in length and, directly underneath it, spongy parenchyma of 3 or 4 layers of chloroplast-containing cells, through which zone course the fibrovascular tissues of the veins.

Stem: The stem is quadrangular. It shows a layer of epidermis bearing hairs similar to those of the leaf and possessing cuticularized outer convex walls, a narrow cortex of chlorenchyma, a clear endodermis of tangentially elongated, thin-walled cells with colorless contents, a narrow phloem, a cambium, and a xylem broadest in the regions beneath the stem angles and containing narrow wood-wedges separated by xylem rays one cell in width. The wood-wedges consist chiefly of simple pitted and spiral vessels, tracheids, and wood-fibers. Beneath each of the four angles of the stem occurs an elliptic to ovate zone of collenchyma. A large pith composed of thin-walled parenchyma occupies the center.

Powdered peppermint: Green to light olive green. Shows fragments of leaf epidermis with wavy vertical walls and, if from the lower surface of the leaf, with numerous stomata and glandular and nonglandular hairs, the latter especially numerous along the veins; glandular hairs with a one- to two-celled stalk and one- to eight-celled head, usually set in a depression in the leaf and containing volatile oil and frequently yellowish or brownish crystals that are birefringent; nonglandular hairs with thin, papillose walls and frequently with short, longitudinal striations of 1–8 cells and up to 1.4 mm in length, the terminal cell pointed or sometimes globular; fragments of chlorenchyma with vascular tissue, the vessels spiral or with simple pits and but slightly lignified; fragments of collenchyma and of thin-walled, nonlignified fibers associated with parenchyma. The pollen grains are spheroidal and smooth.

Peppermint Oil

DEFINITION

Peppermint Oil is the volatile oil distilled with steam from the fresh overground parts of the flowering plant of *Mentha piperita* Linné (Fam. Labiatae), rectified by distillation and neither partially nor wholly dementholized. It yields NLT 5.0% of esters, calculated as menthyl acetate ($C_{12}H_{22}O_2$), and NLT 50.0% of total menthol ($C_{10}H_{20}O$), free and as esters.

IDENTIFICATION

• A.

Sample: 6 drops of Oil

Analysis: Place the *Sample* in a dry test tube and mix with 5 mL of a 1-in-300 solution of nitric acid in glacial acetic acid, and place the tube in a beaker of boiling water.

Acceptance criteria: Within 5 min the liquid develops a blue color that, on continued heating, deepens and shows a copper-colored fluorescence and then fades, leaving a golden-yellow solution.

ASSAY

• TOTAL ESTERS

Sample: 10 g of Oil

Analysis: Place the *Sample* in a 250-mL conical flask, add 10 mL of neutralized alcohol and 2 drops of phenolphthalein TS, then add, dropwise, 0.1 N sodium hydroxide until a faint pink color appears. Add 25.0 mL of 0.5 N alcoholic potassium hydroxide VS, connect the flask to a reflux condenser, and heat on a boiling water bath for 1 h. Allow the mixture to cool, add 20 mL of water, and add phenolphthalein TS.

Titrate the excess alkali with 0.5 N hydrochloric acid VS. Perform a blank determination, disregarding the 0.1 N sodium hydroxide (see *Titrimetry* <541>, *Residual Titrations*). Each mL of 0.5 N alcoholic potassium hydroxide consumed in the saponification is equivalent to 99.15 mg of total esters calculated as $C_{12}H_{22}O_2$.

Acceptance criteria: NLT 5.0% of esters, calculated as $C_{12}H_{22}O_2$

• TOTAL MENTHOL

Sample: 10 mL of Oil

Analysis: Place the *Sample* in an acetylation flask of 100-mL capacity, and add 10 mL of acetic anhydride and 1 g of anhydrous sodium acetate. Boil the mixture gently for 1 h, accurately timed, cool, disconnect the flask from the condenser, transfer the mixture to a small separator, rinsing the acetylation flask with three 5-mL portions of warm water, and add the rinsings to the separator. When the liquids have completely separated, discard the water layer, and wash the remaining oil with successive portions of sodium carbonate TS, diluted with an equal volume of water, until the last washing is alkaline to phenolphthalein TS. Dry the resulting oil with anhydrous sodium sulfate, and filter. Transfer 5 mL of the dry acetylated oil to a tared, 100-mL conical flask, and weigh. Add 50.0 mL of 0.5 N alcoholic potassium hydroxide VS, connect the flask to a reflux condenser, and boil the mixture on a steam bath for 1 h, accurately timed. Allow the mixture to cool, and add 10 drops of phenolphthalein TS.

Titrate the excess alkali with 0.5 N hydrochloric acid VS. Perform a blank determination (see *Titrimetry* <541>, *Residual Titrations*).

Calculate the percentage of total menthol in the Oil tested:

$$\text{Result} = 7.813 \times A \times (1 - 0.0021 \times E) / (W - 0.021 \times A)$$

A = result obtained by subtracting the number of mL of 0.5 N hydrochloric acid required in the above titration from the number of mL of 0.5 N hydrochloric acid required in the residual titration blank

E = percentage of esters calculated as menthyl acetate ($C_{12}H_{22}O_2$)

W = weight of acetylated Oil taken (g)

Acceptance criteria: NLT 50.0% of $C_{10}H_{20}O$, free and as esters

IMPURITIES

• **HEAVY METALS**, *Method II* (231): NMT 20 ppm

• **LIMIT OF DIMETHYL SULFIDE**

Analysis: Distill 1 mL from 25 mL of Oil, and carefully superimpose the distillate on 5 mL of mercuric chloride TS in a test tube.

Acceptance criteria: A white film does not form at the zone of contact within 1 min.

SPECIFIC TESTS

• **SPECIFIC GRAVITY** (841): 0.896–0.908

• **OPTICAL ROTATION**, *Angular Rotation* (781A): -18° to -32°

• **REFRACTIVE INDEX** (831): 1.459–1.465 at 20°

• **SOLUBILITY IN 70% ALCOHOL:** One volume dissolves in 3 volumes of 70% alcohol, with NMT slight opalescence.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and prevent exposure to excessive heat.

Peppermint Spirit—see *Peppermint Spirit General Monographs*

Peppermint Water

DEFINITION

Peppermint Water is a clear, saturated solution of Peppermint Oil in Purified Water, prepared by one of the processes described in *Pharmaceutical Dosage Forms* (1151), *Solutions, Waters, Aromatic*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

Petrolatum—see *Petrolatum General Monographs*

Petrolatum, Hydrophilic—see *Petrolatum, Hydrophilic General Monographs*

Petrolatum, White—see *Petrolatum, White General Monographs*

Phenol—see *Phenol General Monographs*

Phenolsulfonphthalein

$C_{19}H_{14}O_5S$ 354.38

Phenol red;

Phenol, 4,4'-(3*H*-2,1-benzoxathiol-3-ylidene)bis-, (*S*,*S*-dioxide);

3,3-Bis(4-hydroxyphenyl)-3*H*-2,1-benzoxathiole 1,1-dioxide [143-74-8].

DEFINITION

Phenolsulfonphthalein contains NLT 98.0% and NMT 102.0% of 4,4'-(3*H*-2,1-benzoxathiol-3-ylidene)bis-, (*S*,*S*-dioxide) phenol ($C_{19}H_{14}O_5S$), calculated on the dried basis.

IDENTIFICATION

• **A.**

Sample: 5 mg of Phenolsulfonphthalein

Analysis: Transfer the *Sample* to a 100-mL volumetric flask, dissolve in and dilute with sodium carbonate solution (1 in 100) to volume, and mix. Dilute 5.0 mL of the solution so obtained to 100.0 mL with sodium carbonate solution (1 in 100). Examine between 400 and 630 nm.

Acceptance criteria: The solution exhibits an absorption maximum at 558 nm, and the specific absorbance at the maximum is between 1900 and 2100.

• **B.**

Sample: 10 mg of Phenolsulfonphthalein

Analysis: Dissolve the *Sample* in 2 mL of 1 N sodium hydroxide, and add 8 mL of water. To 5 mL of the solution so obtained add 1 mL of 0.1 N potassium bromide–bromate and 1 mL of diluted hydrochloric acid, shake, and allow to stand for 15 min. Render the solution alkaline with 1 N sodium hydroxide.

Acceptance criteria: An intense violet-blue color is produced.

ASSAY

• **PROCEDURE**

Sample: 0.9 g

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 250-mL volumetric flask, dissolve in 15 mL of 1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 10.0 mL of the solution so obtained to a glass-stoppered flask. Add 25 mL of glacial acetic acid, 20.0 mL of 0.1 N potassium bromate VS, 5 mL of potassium bromide solution (1 in 10), and 5 mL of hydrochloric acid, and immediately insert the stopper into the flask. Allow to stand protected from light for 15 min. Quickly add 10 mL of potassium iodide solution (1 in 10), taking care to avoid the escape of bromine vapor. Immediately insert the stopper into the flask, and shake vigorously. Rinse the stopper and the neck of the flask with a small quantity of water. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination, and note the difference in volumes required. Each mL of the difference in volumes of 0.1 N sodium thiosulfate is equivalent to 4.43 mg of phenolsulfonphthalein ($C_{19}H_{14}O_5S$).

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 0.5 g

Acceptance criteria: NMT 0.2%

• CHROMATOGRAPHIC PURITY

Sample solution A: 20 mg/mL of Phenolsulfonphthalein in 0.1 N sodium hydroxide

Sample solution B: Transfer 0.5 mL of *Sample solution A* to a 100-mL volumetric flask, dilute with 0.1 N sodium hydroxide to volume, and mix.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: *tert*-Amyl alcohol, glacial acetic acid, and water (4:1:1)

Analysis

Samples: *Sample solution A* and *Sample solution B*
Allow the plate to air-dry until the solvent has evaporated, and expose the plate to ammonia vapor. Examine the plate under short-wavelength UV light.

Acceptance criteria: NMT 0.5%; NMT one spot, apart from the principal spot, appears in the chromatogram from *Sample solution A*. This spot is not more intense than the spot in the chromatogram from *Sample solution B*.

• INSOLUBLE SUBSTANCES

Sample: 1 g of finely powdered Phenolsulfonphthalein

Analysis: To the *Sample* add a solution of 0.5 g of sodium bicarbonate in 12 mL of water. Allow to stand for 1 h, shaking frequently. Dilute with sufficient water to make 100 mL, and allow to stand for 15 h. Centrifuge at 2000–3000 *g* for 30 min, and decant the supernatant. Wash the residue first with 25 mL of sodium bicarbonate solution (1 in 100), then with 25 mL of water, and dry at 105°.

Acceptance criteria: The weight of the insoluble residue does not exceed 0.5% of the weight of the Phenolsulfonphthalein taken.

SPECIFIC TESTS

• VISUAL TRANSITION INTERVAL

Potassium chloride solution: Dissolve 1.0 g of potassium chloride in 100 mL of water, and adjust with 0.01 N hydrochloric acid or sodium hydroxide to a pH of 6.8.

Sample solution: Dissolve 0.1 g of Phenolsulfonphthalein in 100 mL of alcohol.

Analysis 1: Add 0.15 mL of the *Sample solution* to the *Potassium chloride solution*.

Acceptance criteria 1: The color is yellow with NMT a faint trace of green color.

Analysis 2: Titrate the solution from *Analysis 1* with 0.01 N sodium hydroxide to a pH of 7.0.

Acceptance criteria 2: The color of the solution becomes orange.

Analysis 3: Continue the titration of the solution from *Analysis 2* with 0.01 N sodium hydroxide to a pH of 8.2.

Acceptance criteria 3: The color of the solution becomes red. NMT 0.20 mL of 0.01 N sodium hydroxide is consumed in the entire titration.

• MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):

The total aerobic microbial count does not exceed 10³ cfu/g, and the total combined molds and yeasts count does not exceed 10² cfu/g.

• LOSS ON DRYING (731)

Sample: 1 g of powdered Phenolsulfonphthalein

Analysis: Dry the *Sample* at 105° to constant weight.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

Phenoxyethanol

C₈H₁₀O₂

138.16

2-Phenoxyethanol;

2-Phenoxyethyl alcohol;

Ethylene glycol, 2-monophenyl ether [122-99-6].

DEFINITION

Phenoxyethanol contains NLT 98.0% and NMT 102.0% of phenoxyethanol (C₈H₁₀O₂).

IDENTIFICATION

• **A. INFRARED ABSORPTION (197F):** On an undried specimen

ASSAY

• PROCEDURE

Phenol solution, Standard solution, and Chromatographic system: Prepare as directed in the test for *Organic Impurities*.

Sample stock solution: 5 mg/mL of Phenoxyethanol in isopropyl alcohol

Sample solution: Transfer 500 µL of the *Sample stock solution* to a vial, add 1000 µL of isopropyl alcohol, crimp the vial, and mix on a vortex mixer for 15 s.

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of phenoxyethanol (C₈H₁₀O₂) in the portion of Phenoxyethanol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Phenoxyethanol RS in the *Standard solution* (mg/mL)

C_U = concentration of Phenoxyethanol in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

• ORGANIC IMPURITIES

Phenol solution: 0.25 mg/mL of phenol in isopropyl alcohol

Standard stock solution: 5 mg/mL of USP Phenoxyethanol RS in the *Phenol solution*

Phenylmercuric AcetateC₈H₈HgO₂

336.74

Mercury, (acetato-O)phenyl-;
(Acetato)phenylmercury [62-38-4].**DEFINITION**

Phenylmercuric Acetate contains NLT 98.0% and NMT 100.5% of phenylmercuric acetate (C₈H₈HgO₂).

IDENTIFICATION**• A.**

Sample: 0.1 g

Analysis: To the *Sample* add 0.5 mL of nitric acid. Warm gently until a dark brown color is produced, and dilute with water to 10 mL.

Acceptance criteria: The characteristic odor of nitrobenzene is evolved.

• B.

Sample: 0.1 g

Analysis: To the *Sample* add 0.5 mL of sulfuric acid and 1 mL of alcohol, and warm.

Acceptance criteria: The characteristic odor of ethyl acetate is evolved.

• C.

Sample solution: Saturated solution in water

Analysis: To 5 mL of the *Sample solution* add a few drops of sodium sulfide TS.

Acceptance criteria: A white precipitate is formed, which turns black when the mixture is boiled and then allowed to stand.

ASSAY**• PROCEDURE**

Sample solution: Transfer 500 mg of Phenylmercuric Acetate to a 100-mL flask. Add 15 mL of water, 5 mL of formic acid, and 1 g of zinc dust, and reflux for 30 min. Cool, filter, and wash the filter paper and the amalgam with water until the washings are no longer acid to litmus. Dissolve the amalgam in 40 mL of 8 N nitric acid. Heat on a steam bath for 3 min, and then add 500 mg of urea and enough potassium permanganate TS to produce a permanent pink color. Cool, decolorize the solution with hydrogen peroxide TS, and add 1 mL of ferric ammonium sulfate TS.

Titrimetric system(See *Titrimetry* (541).)**Mode:** Direct titration**Titrant:** 0.1 N ammonium thiocyanate VS**Endpoint detection:** Visual

Analysis: Titrate with *Titrant*, and each mL of 0.1 N ammonium thiocyanate is equivalent to 16.84 mg of phenylmercuric acetate (C₈H₈HgO₂).

Acceptance criteria: 98.0%–100.5%**IMPURITIES**

- RESIDUE ON IGNITION** (281): NMT 0.2%

• MERCURIC SALTS AND HEAVY METALS

Sample solution: Heat 100 mg of Phenylmercuric Acetate with 15 mL of water, cool, and filter.

Analysis: To the *Sample solution* filtrate add a few drops of sodium sulfide TS.

Acceptance criteria: The resulting precipitate shows no immediate color.

• POLYMERURATED BENZENE COMPOUNDS

Sample solution: Shake 2.0 g of Phenylmercuric Acetate with 100 mL of acetone, and filter.

Analysis: Wash the residue with successive portions of acetone until a total of 50 mL is used, then dry the residue at 105° for 1 h. Weigh the residue.

Acceptance criteria: NMT 1.5%; the weight of residue is NMT 30 mg.

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 149°–153°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Phenylmercuric Nitrate

Mercury, (nitrate-O)phenyl-;
Nitratophenylmercury [55-68-5].

DEFINITION

Phenylmercuric Nitrate is a mixture of phenylmercuric nitrate and phenylmercuric hydroxide containing NLT 87.0% and NMT 87.9% of phenylmercuric ion ($C_6H_5Hg^+$), and NLT 62.75% and NMT 63.50% of mercury (Hg).

IDENTIFICATION

- **A.**
Sample: 0.1 g
Analysis: To the *Sample* add 3 mL of sulfuric acid.
Acceptance criteria: The mixture becomes yellow, and the characteristic odor of nitrobenzene is evolved.
- **B.**
Sample solution: Saturated solution in water
Analysis: To 5 mL of the *Sample solution* add 1 mL of 3 N hydrochloric acid.
Acceptance criteria: A white precipitate is formed.
- **C.**
Sample solution: Saturated solution in water
Analysis: To 5 mL of the *Sample solution* add 5 mL of ammonium sulfide TS.
Acceptance criteria: There is no reaction in the cold, but upon heating in a boiling water bath for 10 min, a black precipitate is formed.

ASSAY

• PHENYLMERCURIC IONS

Sample: 200 mg
Analysis: Dissolve the *Sample* in 90 mL of water and 10 mL of nitric acid. Add 2 mL of ferric ammonium sulfate TS. Titrate with 0.05 N ammonium thiocyanate VS. Each mL of 0.05 N ammonium thiocyanate is equivalent to 13.88 mg of phenylmercuric ion ($C_6H_5Hg^+$).
Acceptance criteria: 87.0%–87.9% of phenylmercuric ion

• MERCURY

Sample solution: Transfer 400 mg of Phenylmercuric Nitrate to a 100-mL flask. Add 15 mL of water, 5 mL of formic acid, and 1 g of zinc dust, and reflux for 30 min. Cool. Filter, and wash the filter paper and the amalgam with water until the washings are no longer acid to litmus. Dissolve the amalgam in 40 mL of 8 N nitric acid. Heat on a steam bath for 3 min, then add 0.5 g of urea and enough potassium permanganate TS to produce a permanent pink color. Cool. Decolorize the solution with hydrogen peroxide TS, and add 1 mL of ferric ammonium sulfate TS.

Analysis: Titrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N ammonium thiocyanate is equivalent to 10.03 mg of Hg.

Acceptance criteria: 62.75%–63.50% of mercury

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

SPECIFIC TESTS

• MERCURY IONS

Sample solution: Saturated solution in water

Analysis: To 5 mL of the *Sample solution* add 5 mL of 1 N sodium hydroxide.

Acceptance criteria: No yellow precipitate is formed (mercuric ions), and the solution does not darken (mercurous ions).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

Phosphoric Acid

H_3PO_4 98.00
Phosphoric acid [7664-38-2].

DEFINITION

Phosphoric Acid contains NLT 85.0% and NMT 88.0%, by weight, of H_3PO_4 .

[**CAUTION**—Avoid contact, because Phosphoric Acid rapidly destroys tissues.]

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Phosphate** (191): When carefully neutralized with 1 N sodium hydroxide, phenolphthalein TS being used as the indicator, it meets the requirements.

ASSAY

• PROCEDURE

Sample: 1 g

Blank: 120 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Place the *Sample* in a tared, glass-stoppered flask, and dilute it with water to 120 mL. Add 0.5 mL of thymolphthalein TS. Titrate with 1 N sodium hydroxide VS to the first appearance of a blue color. Perform a blank determination.

Calculate the percentage of phosphoric acid (H_3PO_4) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = volume of *Titrant* consumed by the *Sample* (mL)

V_B = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 49.00 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 85.0%–88.0% by weight

IMPURITIES

- **HEAVY METALS, Method I** (231): NMT 10 ppm

• LIMIT OF NITRATE

Sample solution: Dilute 6 mL of Phosphoric Acid with 14 mL of water.

Analysis: Mix 5 mL of the *Sample solution* with about 0.1 mL of indigo carmine TS, then add 5 mL of sulfuric acid.

Acceptance criteria: The blue color is not discharged within 1 min.

SPECIFIC TESTS

- **CHLORIDE AND SULFATE, Sulfate** <221>
Sample solution: Dilute 6 mL of Phosphoric Acid with 90 mL of water.
Analysis: To the *Sample solution* add 1 mL of barium chloride TS.
Acceptance criteria: No precipitate is formed immediately.
- **ALKALI PHOSPHATES**
Sample: 1 mL
Analysis: Transfer the *Sample* to a graduated cylinder, and add 6 mL of ether and 2 mL of alcohol.
Acceptance criteria: No turbidity is produced.
- **PHOSPHOROUS OR HYPOPHOSPHOROUS ACID**
Sample solution: Dilute 6 mL of Phosphoric Acid with 14 mL of water.
Analysis: Gently warm 5 mL of the *Sample solution*, and add 2 mL of silver nitrate TS.
Acceptance criteria: The mixture does not become brownish.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Diluted Phosphoric Acid

DEFINITION

Diluted Phosphoric Acid contains, in each 100 mL, NLT 9.5 g and NMT 10.5 g of phosphoric acid (H₃PO₄). Diluted Phosphoric Acid may be prepared as follows.

Phosphoric Acid	69 mL
Purified Water, a sufficient quantity to make	1000 mL

Mix the ingredients.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Phosphate** <191>
Sample: 100 mL
Analysis: Carefully neutralize the *Sample* with 1 N sodium hydroxide. Use phenolphthalein TS as the indicator.
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**
Sample: 10 mL
Blank: 50 mL of water
Titrimetric system
 (See *Titrimetry* <541>.)
Mode: Direct titration
Titrant: 1 N sodium hydroxide VS
Endpoint detection: Visual
Analysis: Dilute the *Sample* with water to 50 mL. Add 0.5 mL of thymolphthalein TS. Titrate with *Titrant* to the first appearance of a blue color. Perform a blank determination.
 Calculate the amount of phosphoric acid (H₃PO₄) in the portion of the sample taken:

$$\text{Result} = (V_S - V_B) \times N \times F$$

V_S = *Titrant* volume consumed by the *Sample* (mL)
 V_B = *Titrant* volume consumed by the *Blank* (mL)
 N = actual normality of the *Titrant* (mEq/mL)
 F = equivalency factor, 4.9×10^{-2} g/mEq

Acceptance criteria: 9.5–10.5 g per 100 mL

IMPURITIES

- **HEAVY METALS, Method I** <231>
Test preparation: Dilute 10 g (9.5 mL) with 10 mL of water, add 6 mL of 1 N sodium hydroxide, and dilute with water to 50 mL. Dilute 20 mL of this solution with water to 25 mL.
Acceptance criteria: NMT 5 µg/g
- **LIMIT OF NITRATE**
Sample: 100 mL
Analysis: To the *Sample* add 0.1 mL of indigo carmine TS, then 5 mL of sulfuric acid.
Acceptance criteria: The blue color is not discharged within 1 min.

SPECIFIC TESTS

- **ALKALI PHOSPHATES**
Sample: 20 mL
Analysis: Evaporate the *Sample* on a steam bath to a weight of 5 g. Cool, transfer 2 mL to a graduated cylinder, and add 6 mL of ether and 2 mL of alcohol.
Acceptance criteria: No turbidity is produced
- **PHOSPHOROUS OR HYPOPHOSPHOROUS ACID**
Sample: 100 mL
Analysis: Gently warm the *Sample*, and add 2 mL of silver nitrate TS.
Acceptance criteria: The mixture does not become brownish.
- **CHLORIDE AND SULFATE, Sulfate** <221>
Sample: 100 mL
Analysis: To the *Sample* add 1 mL of barium chloride TS.
Acceptance criteria: No precipitate is formed immediately.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Polacrilin Potassium

2-Propenoic acid, 2-methyl-, potassium salt, polymer with diethenylbenzene;
 Potassium methacrylate–divinylbenzene, copolymer [65405-55-2].

DEFINITION

Polacrilin Potassium is the potassium salt of a unifunctional low-cross-linked carboxylic cation-exchange resin prepared from methacrylic acid and divinylbenzene. When previously dried at 105° for 6 h, it contains NLT 20.6% and NMT 25.1% of potassium (K).

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B. IDENTIFICATION TESTS—GENERAL, Potassium** <191>
Sample solution A: Shake 1 g with 10 mL of water.
Sample solution B: Shake 1 g with 10 mL of 0.1 N hydrochloric acid.
Analysis: Use the aqueous phase from *Sample solution A* and *Sample solution B*.

Acceptance criteria**Sample solution A:** Does not meet the requirements**Sample solution B:** Meets the requirements**ASSAY****• CONTENT OF POTASSIUM****Sodium stock solution:** 14.612 mg/mL of sodium chloride, previously dried at 125° for 30 min. This solution contains 5.76 mg/mL of sodium (Na).**Potassium stock solution:** 745.5 µg/mL of potassium chloride, previously dried at 125° for 30 min. This solution contains 391 µg/mL of potassium (K).**Surfactant solution:** Transfer 5.0 g of a suitable nonionic surfactant to a 250-mL beaker, add 200 mL of water, and stir to dissolve. Transfer this solution to a 500-mL volumetric flask, dilute with water to volume, and mix. [NOTE—To prevent foaming when using this solution, gently run the solution down the sides of the vessel, and use gentle action when mixing.]**Diluted sodium solution:** Transfer 50.0 mL of *Sodium stock solution* and 10.0 mL of *Surfactant solution* to a 100-mL volumetric flask, dilute with water to volume, and mix gently to prevent foaming.**Standard solutions:** To three separate 500-mL volumetric flasks transfer, respectively, 3.0-, 4.0-, and 5.0-mL portions of *Potassium stock solution*. To each flask add 50.0 mL of *Sodium stock solution* and 10.0 mL of *Surfactant solution*, dilute with water to volume, and mix gently to prevent foaming. Each mL of these solutions contains 2.346, 3.128, and 3.910 µg of K, respectively.**Sample solution:** Transfer 1.4 g of Polacrilin Potassium, previously dried, to a 50-mL silica crucible, moisten with 4 mL of sulfuric acid, heat over a small flame until the acid has fumed off, moisten the residue with a few drops of sulfuric acid, and ignite strongly. Allow to cool, transfer, with the aid of water, to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 1.00 mL of this solution to a 100-mL volumetric flask, add 20.0 mL of *Diluted sodium solution*, dilute with water to volume, and mix gently to prevent foaming.**Instrumental conditions**(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** Flame photometry**Analytical wavelength:** 766 nm**Analysis****Samples:** *Standard solutions* and *Sample solution* Concomitantly determine the emittances of the *Standard solutions* and *Sample solution*, adjusting the instrument so that the most concentrated *Standard solution* gives a reading near 100%.Prepare a standard curve by plotting the readings from the *Standard solutions* versus the square root of the potassium concentrations. From the curve, determine the concentration of potassium in the *Sample solution*. Calculate the percentage of potassium in the portion of sample taken:

$$\text{Result} = (C_o/C_u) \times 100$$

 C_o = concentration of the *Sample solution* determined from the standard curve (µg/mL) C_u = concentration of Polacrilin Potassium in the *Sample solution* (µg/mL)**Acceptance criteria:** 20.6%–25.1%**IMPURITIES****• HEAVY METALS, Method III (231):** NMT 20 µg/g**• IRON (241)****Sample:** 0.10 g**Analysis:** Transfer the *Sample* to a suitable crucible, and ignite at a low heat until thoroughly ashed. Add to the carbonized mass 2 mL of nitric acid and 5 drops of sulfuric acid, and heat cautiously until white fumes are no longer evolved. Ignite, preferably in a muffle

furnace, at 500°–600°, until the carbon is completely burned off. Cool, add 4 mL of 6 N hydrochloric acid, cover, digest on a steam bath for 15 min, uncover, and slowly evaporate on a steam bath to dryness. Moisten the residue with 1 drop of hydrochloric acid, add 10 mL of hot water, and digest for 2 min. Dilute with water to 25 mL. Filter, if necessary. Rinse the crucible and the filter with 10 mL of water, combining the filtrate and rinsing in a 50-mL color-comparison tube, add 2 mL of hydrochloric acid, dilute with water to 45 mL, and mix.

Acceptance criteria: NMT 0.01%**• LIMIT OF SODIUM****Sample solution:** Transfer 2 g to a 400-mL borosilicate beaker, add 20 mL of sulfuric acid, cover with a borosilicate watch glass, and heat until charring is complete. While continuing to heat the beaker, add 20 mL of nitric acid dropwise. Continue to heat, and add nitric acid until all of the organic material has been destroyed as indicated by the contents of the beaker turning from brown to a very pale straw-colored or colorless solution. Continue to evaporate the solution, and if it turns brown during the evaporation, add nitric acid dropwise until the brown color disappears. Evaporate just to dryness, cool, and dissolve the residue in 40 mL of water and 10 mL of 6 N hydrochloric acid. Heat to boiling, cool, transfer to a 100-mL volumetric flask, dilute with water to volume, and mix.**Standard solutions:** To three separate 100-mL volumetric flasks add, respectively, 1.00, 2.00, and 3.00 mL of a solution containing 254.2 mg of sodium chloride in 1000 mL of water. Add water to volume, and mix to obtain sodium chloride solutions having concentrations equivalent to 1, 2, and 3 µg/mL of Na, respectively.**Instrumental conditions**(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** Flame photometry**Analytical wavelength:** 589 nm**Analysis****Samples:** *Standard solutions* and *Sample solution* Adjust the instrument so that the emission of the *Standard solution* with a concentration of 3 µg/mL reads close to 100% at 589 nm.Determine the readings of the three *Standard solutions* at 589 nm. Readjust the wavelength setting to 580 nm, and determine the background emission reading for one of these *Standard solutions*.Pipet 5 mL of the *Sample solution* into a 100-mL volumetric flask, add water to volume, and mix.

Observe the emission reading of this solution at 589 nm, using the same instrument settings, then readjust the wavelength setting to 580 nm, and observe the background emission reading.

Subtract the corresponding background readings from the readings of *Standard solutions* and *Sample solution*.Prepare a standard curve by plotting the corrected *Standard solution* readings versus the square root of the sodium concentration. From this standard curve, determine the sodium content in the sample taken.**Acceptance criteria:** NMT 0.20%**SPECIFIC TESTS****• POWDER FINENESS (811)****Sample:** 4 g**Analysis:** Transfer the *Sample* to a No. 100 standard sieve placed on top of a No. 200 standard sieve and pan. Using a soft 2-cm brush, brush the sample lightly across the No. 100 sieve until no more particles pass through. By brushing and tapping, dust off the particles on the underside of the No. 100 sieve into the No. 200 sieve. Obtain the weight of the material retained on the No. 100 sieve. Similarly, determine the weight of material retained by the No. 200 sieve.

Acceptance criteria: NMT 1.0% is retained on the No. 100 sieve, and NMT 30.0% is retained on the No. 200 sieve.

• **LOSS ON DRYING** <731>

Analysis: Dry at 105° for 6 h.

Acceptance criteria: NMT 10.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** <11>

USP Polacrilin Potassium RS

Poloxamer

$\text{HO}(\text{C}_2\text{H}_4\text{O})_a(\text{C}_3\text{H}_6\text{O})_b(\text{C}_2\text{H}_4\text{O})_a\text{H}$

Oxirane, methyl-, polymer with oxirane;

α -Hydro- ω -hydroxypoly(oxyethylene)_a-poly(oxypropylene)_b-poly(oxyethylene)_a block copolymer, in which a and b have the values shown in the following table:

Poloxamer	a	b
124	12	20
188	80	27
237	64	37
338	141	44
407	101	56

Polyethylene-polypropylene glycol [9003-11-6].

DEFINITION

Poloxamer is a synthetic block copolymer of ethylene oxide and propylene oxide. It is available in several types, conforming to the requirements shown in the following table.

Pol-ox-amer	Physical Form	Average Molecular Weight	Weight (% Oxyethylene)	Unsaturation (mEq/g)
124	Liquid	2090–2360	46.7 ± 1.9	0.020 ± 0.008
188	Solid	7680–9510	81.8 ± 1.9	0.026 ± 0.008
237	Solid	6840–8830	72.4 ± 1.9	0.034 ± 0.008
338	Solid	12,700–17,400	83.1 ± 1.7	0.031 ± 0.008
407	Solid	9840–14,600	73.2 ± 1.7	0.048 ± 0.017

It may contain a suitable antioxidant.

IDENTIFICATION

• **A. INFRARED ABSORPTION** <197F>: Use a thin film of melted specimen if it is a solid. Use USP Poloxamer Liquid RS for Poloxamer 124, and use USP Poloxamer Solid RS for Poloxamer 188, 237, 338, and 407. Because of the differences in the ratios of copolymer composition, the intensity of some absorption bands may vary.

ASSAY

• **AVERAGE MOLECULAR WEIGHT**

Phthalic anhydride–pyridine solution: Dissolve 144 g of phthalic anhydride in freshly opened or freshly distilled pyridine containing less than 0.1% of water, and dilute with pyridine to 1000 mL. Protect from light, and allow to stand overnight. To verify that the *Phthalic anhydride–pyridine solution* has adequate strength, pipet 10 mL into a 250-mL conical flask, add 25 mL of pyridine and 50 mL of water, and after 15 min add 0.5 mL

of a solution of phenolphthalein in pyridine (1 in 100), then titrate with 0.5 N sodium hydroxide VS: it consumes between 37.6 and 40.0 mL of 0.5 N sodium hydroxide.

Analysis: Weigh a suitable quantity, not exceeding 15 g, of Poloxamer, calculated by multiplying the average molecular weight by 0.004, into a glass-stoppered, 250-mL boiling flask. Carefully pipet 25 mL of *Phthalic anhydride–pyridine solution* into the flask, touching the tip of the drained pipet to the protrusion in the flask. Add a few glass beads, and swirl to dissolve the specimen. Pipet 25 mL of *Phthalic anhydride–pyridine solution* into a second, glass-stoppered, conical flask, add a few glass beads, and use as the reagent blank. (An additional 25-mL portion of pyridine may be added to both the test specimen and reagent blank, before refluxing, if necessary to ensure fluidity.) Heat both flasks, fitted with suitable reflux condensers, and allow to reflux for 1 h. Allow to cool, and pour two 10-mL portions of pyridine through each condenser. Remove the flasks from the condensers, add 10 mL of water to each, insert the stoppers, swirl, and allow to stand for 10 min. To each flask add 50.0 mL of 0.66 N sodium hydroxide and 0.5 mL of a solution (1 in 100) of phenolphthalein in pyridine. Titrate with 0.5 N sodium hydroxide VS to a light pink endpoint that persists for NLT 15 s. Calculate the average molecular weight:

$$\text{Result} = 2000 \times W / [(V_8 - V_5) \times N]$$

W = weight of the sample taken (g)

V₈ = volume of 0.5 N sodium hydroxide VS consumed by the blank (mL)

V₅ = volume of 0.5 N sodium hydroxide VS consumed by the residual acid in the test solution (mL)

N = actual normality of the 0.5 N sodium hydroxide VS

Acceptance criteria: See the table in the *Definition*.

• **WEIGHT PERCENT OXYETHYLENE**

Solvent: Use deuterated water or deuteriochloroform.

NMR reference: Use sodium 2,2-dimethyl-2-silapentane-5-sulfonate (for deuterated water) or tetramethylsilane (for deuteriochloroform).

Sample solution: Dissolve 0.1–0.2 g of Poloxamer in deuterated water containing 1% of sodium 2,2-dimethyl-2-silapentane-5-sulfonate to obtain 1 mL of solution, or, if the Poloxamer does not dissolve in water, use deuteriochloroform containing 1% of tetramethylsilane as the solvent.

Instrumental conditions

(See *Nuclear Magnetic Resonance* <761>, *Relative Method of Quantitation*)

Mode: Nuclear magnetic spectrometry

Sample size: 0.5–1.0 mL of the *Sample solution*

Analysis:

Sample: *Sample solution*

Transfer the *Sample solution* to a standard 5-mm NMR spinning tube, and if deuteriochloroform is the solvent, add 1 drop of deuterated water, and shake the tube. Scan the region at 0–5 ppm, and use the calculation formulas specified below. Record as A₁ the average area of the doublet appearing at about 1.08 ppm, representing the methyl groups of the oxypropylene units, and record as A₂ the average area of the composite band at a range of 3.2–3.8 ppm, due to the CH₂O groups of both the oxyethylene and oxypropylene units and also the CHO groups of the oxypropylene units, with reference to the sodium 2,2-dimethyl-2-silapentane-5-sulfonate or tetramethylsilane singlet at 0 ppm.

Calculate the percentage of oxyethylene, by weight, in the Poloxamer taken:

$$\alpha = (A_2/A_1) - 1$$

- A_2 = average area of the composite band at a range of 3.2–3.8 ppm
 A_1 = average area of the doublet appearing at about 1.08 ppm

$$\text{Result} = 3300 \times \alpha / (33 \times \alpha + 58)$$

Acceptance criteria: See the table in the *Definition*.

• **UNSATURATION**

Solution A: Place 50 g of mercuric acetate in a 1000-mL volumetric flask, and dissolve with 900 mL of methanol to which 0.5 mL of glacial acetic acid has been added. Dilute with methanol to volume, and mix. Discard the solution if it is yellow. If it is turbid, filter it. Discard it if it is still turbid. Use fresh reagents if it is necessary to repeat the preparation of the solution. Protect the solution from light by storing it in an amber bottle in the dark.

Sample: 15.0 g

Analysis: Transfer the *Sample* to a 250-mL conical flask. Pipet 50 mL of *Solution A* into the flask, and mix on a magnetic stirrer until solution is complete. Allow to stand for 30 min with occasional swirling. Add 10 g of sodium bromide crystals, and stir on a magnetic stirrer for 2 min. Without delay, add 1 mL of phenolphthalein TS, and titrate the liberated acetic acid with 0.1 N methanolic potassium hydroxide VS. Perform a blank determination. Determine also the initial acidity as follows. Dissolve 15.0 g of Poloxamer in 75 mL of methanol that has been neutralized with methanolic potassium hydroxide to the phenolphthalein endpoint. Add 1 mL of phenolphthalein TS, and titrate with the same 0.1 N methanolic potassium hydroxide VS under a nitrogen sweep.

Calculate the unsaturation, in mEq/g:

$$\text{Result} = (V_U - V_B - V_A) \times N/15$$

- V_U = volume of 0.1 N methanolic potassium hydroxide used for titrating the test specimen (mL)
 V_B = volume of 0.1 N methanolic potassium hydroxide used for titrating the blank (mL)
 V_A = volume of 0.1 N methanolic potassium hydroxide used for titrating the initial acidity (mL)
 N = normality of the titrant

Acceptance criteria: See the table in the *Definition*.

IMPURITIES

- **HEAVY METALS, Method I (231):** NMT 20 ppm
 • **LIMIT OF FREE ETHYLENE OXIDE, PROPYLENE OXIDE, AND 1,4-DIOXANE**

Stripped poloxamer: Place 500 g of Poloxamer 124 into a suitable 3-neck, round-bottom flask equipped with a stirrer, a thermometer, a vacuum outlet, and a heating mantle. Evacuate the flask carefully at room temperature to a pressure of less than 10 mm of mercury, applying the vacuum slowly to avoid excessive foaming due to entrapped gases. After any foaming has subsided, heat the flask to 80° and continue to apply vacuum for 2 h; then cool to room temperature. Shut off the vacuum pump, and introduce nitrogen to bring the flask pressure back to atmospheric pressure. Transfer the *Stripped poloxamer* to a suitable nitrogen-filled container.

Standard solution

[**CAUTION**—Ethylene oxide, propylene oxide, and 1,4-dioxane are toxic and flammable. Prepare these solutions in a well-ventilated fume hood.]

To a tared vial that can be sealed add 50.0 g of *Stripped poloxamer*. Add 60 µL of 1,4-dioxane and 75 µL of propylene oxide from a chilled syringe. Add ethylene oxide, using the following special handling procedure. Ethylene oxide, which is a gas at room temperature, is

usually stored in a lecture-type gas cylinder or a small, metal pressure-bomb. Chill the cylinder in a refrigerator before use. Transfer 5 mL of the liquid ethylene oxide to a 100-mL beaker chilled in wet ice. Using a gas-tight syringe that has been chilled in a refrigerator, transfer 15 µL of the liquid ethylene oxide to the mixture. Immediately seal the vial, and shake on a vortex mixer for at least 30 s. Transfer 0.20 g of this solution to a tared vial that can be sealed, and add *Stripped poloxamer* to obtain a *Standard solution* having a final weight of 50.0 g. Each g of this *Standard solution* contains 1 µg of ethylene oxide, 5 µg of propylene oxide, and 5 µg of 1,4-dioxane. Transfer 1.00 ± 0.01 g of this solution to a 22-mL pressure headspace vial, and add about 0.01 g of butylated hydroxytoluene. Seal with a silicone septum with or without a pressure-relief star spring and with a pressure-relief, aluminum, safety sealing-cap, and crimp the cap closed with a cap-sealing tool.

Sample solution: Transfer 1.00 ± 0.01 g of Poloxamer to a 22-mL pressure headspace vial, and add 0.01 g of butylated hydroxytoluene. Seal, cap, and crimp as directed for the *Standard solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC (equipped with a balanced-pressure automated headspace sampler)

Detector: Flame ionization

Column: 0.32-mm × 50-m fused-silica capillary; 5-µm layer of stationary phase G27 coating

Temperature

Detector: 250°

Injector: 250°

Transfer line: 140°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	10
70	10	240	10

Carrier gas: Helium

Flow rate: 1.6 mL/min

Injection size: Separately place the vials containing the *Standard solution* and the *Sample solution* in the automated sampler, and start the sequence so that the vial is heated at a temperature of 110° for 30 min before a suitable portion of its headspace is injected into the chromatograph.

Autosampler

Needle-withdrawal time: 0.3 min

Pressurization time: 1 min

Injection time: 0.08 min

Vial pressure: 22 psig with the vial vent off

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for ethylene oxide, propylene oxide, and 1,4-dioxane are about 1.0, 1.3, and 3.8, respectively.]

Suitability requirements

Resolution: NLT 2.0 between ethylene oxide and propylene oxide

Relative standard deviation: NMT 15%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentrations, in µg/g, of ethylene oxide, propylene oxide, and 1,4-dioxane in the portion of Poloxamer taken:

$$\text{Result} = (r_U/r_S) \times C$$

r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C = concentration of ethylene oxide, propylene oxide, or 1,4-dioxane in the *Standard solution* ($\mu\text{g/g}$)

Acceptance criteria

Ethylene oxide: NMT 1 $\mu\text{g/g}$
 Propylene oxide: NMT 5 $\mu\text{g/g}$
 1,4-Dioxane: NMT 5 $\mu\text{g/g}$

SPECIFIC TESTS

Hydrogenated Polydecene

 $\text{C}_{30\leq n \leq 70}\text{H}_{2n+2}$

1-Decene, homopolymer, hydrogenated [68037-01-4].

DEFINITION

Hydrogenated Polydecene is a mixture of saturated, synthetic hydrocarbons in the range $\text{C}_{30}\text{H}_{62}$ through $\text{C}_{70}\text{H}_{142}$ made from direct oligomerization of 1-decene (C_{10} alpha olefin). The oligomer mixture may be distilled to fractions of a suitable calculated viscosity and hydrogenated to reach saturation, or it may be hydrogenated to reach saturation and then distilled to the desired viscosity. The requirements for specific gravity, viscosity, and content of decene oligomer differ for the various types of Hydrogenated Polydecene, as set forth in the two tables below. Hydrogenated Polydecene may contain a suitable stabilizer.

Specific Gravity and Viscosity

Type	Specific Gravity	Kinematic Viscosity Range, Centistokes (mm^2/s)
I	0.814–0.819	16.0–20.0
II	0.823–0.827	28.0–34.0
III	0.828–0.832	40.0–52.0

Content of Decene Oligomers

Type	$\text{C}_{30}\text{H}_{62}$	$\text{C}_{40}\text{H}_{82}$	$\text{C}_{50}\text{H}_{102}$	$\text{C}_{60}\text{H}_{122}$	$\text{C}_{70}\text{H}_{142}$
I	70–93	5–25	0–5	0–1	0–1
II	13–40	35–70	9–25	0–7	0–2
III	3–15	25–55	25–40	13–28	0–10

IDENTIFICATION

- A.** The chromatogram of the *Sample solution* from the test for *Content of Decene Oligomer* exhibits major peaks for trimers, tetramers, pentamers, hexamers, and possibly heptamers. The decene oligomer content is within the range given in the table *Content of Decene Oligomers* in the *Definition* for the labeled type of Hydrogenated Polydecene.

ASSAY

- CONTENT OF DECENE OLIGOMER**

System suitability solution: 10 mg/mL of hexadecane, 10 mg/mL of squalane, and 1 mg/mL of tetradecane in pentane

Sample solution: Dissolve 0.1 mL of Hydrogenated Polydecene in 10 mL of pentane.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.52-mm \times 16-m fused-silica capillary; coated with 0.1-mm stationary phase G2

Carrier gas: Helium

Flow rate: 10 mL/min

Injection volume: 2 μL

Temperatures

Injection port: 310°

Detector: 320°

Column: See Table 1.

Table 1

Initial Temperature (°)	Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
35	5	50	—
50	12	170	—
170	10	310	18

System suitability

Sample: *System suitability solution*

[NOTE—The retention time for squalene is about 18 min; the relative retention times for tetradecane, hexadecane, and squalene are about 0.5, 0.6, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between tetradecane and hexadecane

Relative standard deviation: NMT 2.0% for each peak

Analysis

Sample: *Sample solution*

Record the chromatogram, and measure the areas for the major peaks.

[NOTE—The tetramer oligomer has a retention time of about 23 min. The trimer, pentamer, hexamer, and heptamer oligomers, if present, have relative retention times of about 0.8, 1.1, 1.3, and 1.4, respectively, relative to the tetramer.]

Calculate the percentage of each oligomer present:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = response of each oligomer

r_T = sum of the responses of all the peaks, excluding the solvent peak

Acceptance criteria: The decene oligomer content is within the limits specified in the table *Content of Decene Oligomers* in the *Definition*.

IMPURITIES

- LIMIT OF NICKEL**

Nickel stock solution: Immediately before use, dilute an appropriate quantity of organometallic standard¹ with kerosene to prepare a solution containing the equivalent of 1.0 $\mu\text{g/mL}$ of nickel.

Standard solutions: Transfer 0.5, 1.0, 2.0, and 4.0 mL of *Nickel stock solution*, respectively, to four identical 10-mL volumetric flasks, dilute the contents of each flask with kerosene to volume, and mix. These *Standard*

¹ Suitable organometallic standards are available from, e.g., Continental Oil Co., Ponca City, OK (Conostan, 100 ppm), or Merck, D-6100 Darmstadt, Germany (metal in standard oil, 1000 ppm).

solutions contain, respectively, 0.05, 0.1, 0.2, and 0.40 µg/mL of nickel. [NOTE—The calibration range, especially the upper limit, can be adjusted for certain instruments, provided that instrument validation and calibration linearity are achieved.]

Sample solution: 0.3 g/mL of Hydrogenated Polydecene in kerosene. [NOTE—If necessary, dilute with an appropriate quantity of kerosene to obtain a reading within the calibrated absorbance range.]

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Graphite furnace atomic absorption spectrophotometer equipped with a deuterium background corrector and a pyrolytically coated tube with platform

Analytical wavelength: 232.0 nm (nickel emission line)

Injection volume: 20 µL

Lamp: Nickel hollow-cathode

Blank: Kerosene

Temperature: See Table 2.

[NOTE—The temperature program may be modified to obtain optimum furnace temperatures.]

Table 2

Step	Temperature (°)	Hold Time (s)
Drying	80	1
Drying	120	10
Drying	300	20
Ashing	600	20
Ashing	1000	20
Atomization	2500	3
Cleaning	2600	5

Analysis

Samples: *Standard solutions* and *Sample solution*

Place the *Standard solutions* and the *Sample solution* in an oven, setting the temperature at about 60° during the period of determination, and shake these solutions vigorously before analysis. Use micropipettor and pipettor tips to make all injections. [NOTE—Positive displacement pipets can be used when viscosity may become a problem.]

Pretreat the pipettor tip by pipetting and then discarding 20 µL of heptane. The tip must be pretreated before each injection. [NOTE—The film of heptane remaining on the wall of the tip facilitates a reproducible transfer of the oil sample.]

Separately inject the *Standard solutions* and the *Sample solution* into a graphite furnace, and concomitantly determine the integrated absorbances of the *Standard solutions* and the *Sample solution*.

Plot the integrated absorbances of the *Standard solutions* versus concentration, in µg/mL, of nickel, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration of nickel, *C*, in µg/mL, in the *Sample solution*.

Calculate the content of nickel in the Hydrogenated Polydecene taken:

$$\text{Result} = C/C_U$$

C = concentration of nickel obtained from the graph (µg/mL)

C_U = concentration of nickel in the *Sample solution* (g/mL)

Acceptance criteria: NMT 1 µg/g

• **LIMIT OF SHORT-CHAIN HYDROCARBONS**

System suitability solution, Sample solution, Chromatographic system, System suitability, and

Analysis: Proceed as directed in the test for *Content of Decene Oligomer*.

Calculate the percentage of each of the short-chain hydrocarbons present:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of any peak eluting before the trimer but different from the solvent peak

r_T = sum of the responses of all the peaks in the chromatogram, excluding the solvent peak

Acceptance criteria: NMT 2.5% of total short-chain hydrocarbons is found.

SPECIFIC TESTS

• **SPECIFIC GRAVITY (841)**

Analysis: Determine at 20°.

Acceptance criteria: Meets the requirements of the specific gravity range specified in the table *Specific Gravity and Viscosity* in the *Definition* for the labeled type

• **VISCOSITY—CAPILLARY VISCOMETER METHODS (911)**

Analysis: Determine using a capillary viscometer, in a liquid bath maintained at 40.0 ± 0.1°.

Acceptance criteria: Meets the requirements of the viscosity range specified in the table *Specific Gravity and Viscosity* in the *Definition* for the labeled type.

• **READILY CARBONIZABLE SUBSTANCES TEST (271)**

Standard solution: 3 mL of ferric chloride CS, 1.5 mL of cobaltous chloride CS, and 0.5 mL of cupric sulfate CS in a glass-stoppered test tube previously treated to remove organic matter (see *Cleaning Glass Apparatus* (1051)).

Sample: 5 mL

Analysis: Transfer the *Sample* to a glass-stoppered test tube previously treated to remove organic matter (see *Cleaning Glass Apparatus* (1051)), add 5 mL of sulfuric acid, and heat in a boiling water bath for 30 s. Quickly remove the test tube, and, while holding the stopper in place, shake three times in a vertically reciprocating cycle with an amplitude of about 13 cm. Repeat this procedure every 30 s for 10 min. Do not keep the test tube out of the water bath any longer than 3 s for each shaking cycle. Remove the test tube from the water bath, and let it cool for about 20 min to room temperature.

Acceptance criteria: The oil phase of the *Sample* may turn hazy but remains colorless; the interface between the two layers is free from solids; and the acid layer does not become darker than the standard color produced by the *Standard solution*, the *Standard solution* being overlaid with 5 mL of Hydrogenated Polydecene.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements are specified.

• **LABELING:** Label it to indicate, as part of the official title, the Hydrogenated Polydecene type (Type I, Type II, or Type III), and label it to indicate the name and concentration of any added stabilizer.

Polydextrose

[68424-04-4].

DEFINITION

Polydextrose is a randomly branched polymer prepared by melting and subsequent condensation of the ingredients, which consist of approximately 90 parts dextrose, 10 parts sorbitol, and up to 1 part citric acid or 0.1 part phosphoric acid. The 1,6-glycosidic linkage predominates in the polymer but other linkages are present. It contains NLT 90.0% of dextrose polymer units, calculated on the

anhydrous and ash-free basis. It contains small quantities of free dextrose, sorbitol, and 1,6-anhydro-D-glucose (levoglucosan), with traces of citric acid or phosphoric acid.

IDENTIFICATION

- **A.** To 1 drop of a solution (1 in 10), add 4 drops of 5% phenol solution, then rapidly add 15 drops of sulfuric acid TS: a deep yellow to orange color is produced.
- **B.** With vigorous swirling, add 1 mL of acetone to 1 mL of a solution (1 in 10): the solution remains clear.
- **C.** With vigorous swirling, add 2 mL of acetone to the solution obtained in *Identification test B*: a heavy, milky turbidity develops immediately.
- **D.** To 1 mL of a solution (1 in 50), add 4 mL of alkaline cupric citrate TS. Boil vigorously for 2–4 min. Remove from heat, and allow the precipitate (if any) to settle: the supernatant is blue or blue-green.

ASSAY

PROCEDURE

Mobile phase: 0.001 N sulfuric acid. Pass this solution through a filter of 0.5- μ m pore size, and degas.

Standard solution: 4.0 mg/mL of USP Polydextrose RS, calculated on the anhydrous and ash-free basis, in *Mobile phase*

Sample solution: 4.0 mg/mL of Polydextrose, calculated on the anhydrous and ash-free basis, in *Mobile phase*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Detector temperature: $35 \pm 0.1^\circ$

Guard column: 4.6-mm \times 3.0-cm, packing L17

Analytical column: 7.8-mm \times 30-cm, packing L17

Flow rate: 0.6 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of dextrose polymer units in the portion of Polydextrose taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of dextrose polymer units from the *Sample solution*

r_S = peak response of dextrose polymer units from the *Standard solution*

C_S = concentration of USP Polydextrose RS in the *Standard solution* (mg/mL)

C_U = concentration of Polydextrose in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 90.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 0.3%

LIMIT OF LEAD

[NOTE—Use reagent-grade chemicals with as low a lead content as is practicable, as well as high-purity water and gases. Before use in this analysis, rinse all glassware and plasticware twice with 10% nitric acid and twice with 10% hydrochloric acid, and then rinse them thoroughly with Purified Water.]

Matrix modifier solution: Prepare a solution in water containing 100.0 mg of dibasic ammonium phosphate per 10 mL of solution.

Lead nitrate stock solution: Dissolve 159.8 mg of lead nitrate in 100 mL of water to which has been added 1 mL of nitric acid, then dilute with water to 1000 mL.

Prepare and store this solution in glass containers free from soluble lead salts.

Standard lead solution: On the day of use, dilute 10.0 mL of *Lead nitrate stock solution* with water to 100.0 mL. Each mL of *Standard lead solution* contains the equivalent of 10 μ g of lead.

Standard solution A: 0.02 μ g/mL of lead, from *Standard lead solution* in water

Standard solution B: 0.05 μ g/mL of lead, from *Standard lead solution* in water

Standard solution C: 0.1 μ g/mL of lead, from *Standard lead solution* in water

Standard solution D: 0.2 μ g/mL of lead, from *Standard lead solution* in water

Standard solution E: 0.5 μ g/mL of lead, from *Standard lead solution* in water

Sample solution: Transfer 1.0 g of Polydextrose, weighed and calculated on the anhydrous and ash-free basis, into a 10-mL volumetric flask, and dissolve in and dilute with water to volume.

Spiked sample solution: Transfer 1.0 g of Polydextrose, weighed and calculated on the anhydrous and ash-free basis, into a 10-mL volumetric flask, and dissolve in water. Add 100 μ L of the *Standard lead solution*, and dilute with water to volume. This solution contains 0.1 μ g/mL of added lead.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Graphite furnace atomic absorption spectrophotometer, equipped with a pyrolytic tube with a platform

Lamp: A lead hollow-cathode lamp, using a slit width of 0.7 mm (set low) and a deuterium arc lamp for background correction

Analytical wavelength: Lead emission line of 283.3 nm

Autosampler

Sample volume: 10 μ L

Alternative volume: 10 μ L of *Matrix modifier solution*

Furnace program: See the temperature program table below.

Step	Dry	Char	Atomize	Clean	Recharge
Temperature ($^\circ$)	130	800	2400	2600	20
Ramp time (s)	20	20	0	1	2
Hold time (s)	40	40	6	5	20
Argon flow rate (mL/min)	300	300	50	300	300

Analysis

Samples: 10 μ L of the *Matrix modifier solution* was added into each 10- μ L aliquot of the five *Standards solutions*, a mixture of 10 μ L of the *Matrix modifier solution* and 10 μ L of the *Sample solution*, and a mixture of 10 μ L of the *Matrix modifier solution* and 10 μ L of the *Spiked sample solution*

Concomitantly determine the absorbances of the *Samples* using the *Spectrometric conditions* described above. Plot the absorbance of each *Standard solution*, compensated for background correction, versus its content of lead, in μ g/mL, and draw the best straight line fitting the five points. From this plot, determine the concentrations, C_T and C_{ST} , in μ g/mL, of lead in the *Sample solution* and the *Spiked sample solution*, respectively.

Calculate the percentage recovery taken:

$$\text{Result} = [(C_{ST} - C_T)/A] \times 100$$

A = quantity of lead added to the *Spiked sample solution*, 0.1 µg/mL
Calculate the content, in µg/g, of lead in the portion of Polydextrose taken:

$$\text{Result} = (C_T/W) \times V$$

W = weight of Polydextrose taken to prepare the *Sample solution* (g)

V = volume of the *Sample solution*, 10 mL

Acceptance criteria: NMT 0.5 µg/g. The recovery is 80%–120%.

Organic Impurities

• PROCEDURE 1: LIMIT OF 5-HYDROXYMETHYLFURFURAL AND RELATED COMPOUNDS

Sample solution: 1.0 g of Polydextrose, weighed and calculated on the anhydrous and ash-free basis, diluted with water to 100 mL.

Analysis: Determine the absorbance of the *Sample solution* in a 1-cm quartz cell at 283 nm, with a suitable spectrophotometer, using water as the blank. Calculate the percentage of 5-hydroxymethylfurfural and related compounds in the Polydextrose taken:

$$\text{Result} = 100 \times (V \times M_r \times A)/(M \times L \times W)$$

V = volume of the *Sample solution*, 0.1 L

M_r = molecular weight of 5-hydroxymethylfurfural, 126 g/mol

A = absorbance of the *Sample solution*

M = molar extinction coefficient of 5-hydroxymethylfurfural at a wavelength of 283 nm, 16,830 L/mol cm

L = path length of the spectrophotometer cell (cm)

W = weight of Polydextrose taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1%

• PROCEDURE 2: LIMIT OF MONOMERS

Mobile phase, Sample solution, and Chromatographic system: Prepare as directed in the *Assay*.

Standard solution: 0.08 mg/mL of each of USP 1,6-Anhydro-D-glucose RS and USP Sorbitol RS, and 0.16 mg/mL of USP Dextrose RS, in *Mobile phase*

System suitability

Sample: *Standard solution*

[NOTE—For relative retention times, see *Table 1* below.]

Table 1

Name	Relative Retention Time
Dextrose (glucose)	0.7
Sorbitol	0.8
An isomer of 1,6-anhydro-D-glucose (D-anhydroglucose furanose form)	0.9
1,6-Anhydro-D-glucose (D-anhydroglucose pyranose form)	1.0

Suitability requirements

Resolution: NLT 1.0

Relative standard derivation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Use peak response of USP 1,6-Anhydro-D-glucose RS in the *Standard solution* for calculation of percentage of the isomer of 1,6-anhydro-D-glucose in the *Sample solution*.

Calculate the percentage of each monomer in the portion of Polydextrose taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the respective monomer from the *Sample solution*

r_S = peak response of the respective monomer from the *Standard solution*

C_S = concentration of the respective standard monomer in the *Standard solution* (mg/mL)

C_U = concentration of Polydextrose in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 4.0% for 1,6-anhydro-D-glucose, NMT 4.0% for dextrose, and NMT 2.0% for sorbitol. [NOTE—In the case of 1,6-anhydro-D-glucose, the peak areas for the pyranose and furanose forms are combined.]

SPECIFIC TESTS

• MOLECULAR WEIGHT LIMIT

Mobile phase: Dissolve 35.0 g of sodium nitrate and 1.0 g of sodium azide in 100 mL of water. Dilute with water to 4 L. Pass through a filter of 0.45-µm pore size, and degas by applying an aspirator vacuum for 30 min. The resulting *Mobile phase* is 0.1 N sodium nitrate containing 0.025% sodium azide.

Standard solution: Transfer 20 mg each of USP Dextrose RS, stachyose, and 5800-, 23,700-, and 100,000-molecular weight (MW) pullulan standards into a 10-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume. Pass through a syringe filter of 0.45-µm pore size into a suitable autosampler vial, and seal.

Sample solution: Transfer 50 mg of Polydextrose into a 10-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume. Pass through a syringe filter of 0.45-µm pore size into a suitable autosampler vial, and seal.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index set at a sensitivity of 4×10^{-6} refractive index units full scale and maintained at a temperature of $35 \pm 0.1^\circ$

Column: 7.8-mm × 30-cm; packing L39

Column temperature: 45°

Flow rate: 0.8 mL/min

[NOTE—After installation of a new column, pump *Mobile phase* through the column overnight at a rate of 0.3 mL/min. Before calibration or analysis, increase the flow slowly over a 1-min period to 0.8 mL/min. Continue to pump *Mobile phase* through the column at this flow rate for at least 1 h before the first injection. Check the flow gravimetrically, and adjust it if necessary. Reduce the flow rate to about 0.1 mL/min when the system is not in use.]

Injection size: 50 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention times for each component determined on replicate injections agree within ± 2 s.]

Chromatograph five replicate injections of the *Standard solution*, allowing 15 min between injections, and record the retention times of the components of the *Standard solution*.

Insert the average retention time along with the molecular weight of each component in the *Standard solution* into the calibration table of the molecular weight distribution software. Check the regression results for a cubic fit of the calibration points, and obtain a correlation coefficient, R, for the line.

Suitability requirements

Resolution: Dextrose and stachyose are baseline resolved from one another and from the 5800-MW pullulan standard.

[NOTE—Prominent negative baseline valleys are usually observed between the peaks for the 5800-; 23,700-; and 100,000-MW pullulan standards.]

Correlation coefficient R: NLT 0.9999

Analysis

Samples: *Standard solution* and *Sample solution*

Use the molecular weight distribution software of the data reduction system to generate a molecular weight distribution plot of Polydextrose.

Acceptance criteria: No measurable peak above a molecular weight of 22,000 is found.

- **pH** (791): 2.5–5.0, in a solution (1 in 10)
- **WATER DETERMINATION, Method I** (921): NMT 4.0%. Use a mixture of Hydranal solvent and Hydranal formamide dry (2:1) as a solvent. Perform the titration at 50° in a jacketed beaker.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store in a cool and dry place.
- **USP REFERENCE STANDARDS** (11)
 - USP 1,6-Anhydro-D-glucose RS
 - USP Dextrose RS
 - USP Polydextrose RS
 - USP Sorbitol RS

Hydrogenated Polydextrose

DEFINITION

Hydrogenated Polydextrose is obtained by transition metal catalytic hydrogenation of Polydextrose in aqueous solution. It contains NLT 90.0% of dextrose polymer units, calculated on the anhydrous and ash-free basis. The polymer chain end groups are mainly sorbitol-terminated.

IDENTIFICATION

- **A.** To 1 drop of a solution (1 in 10), add 4 drops of 5% phenol solution, then rapidly add 15 drops of sulfuric acid TS: a deep yellow to orange color is produced.
- **B.** With vigorous swirling, add 1 mL of acetone to 1 mL of a solution (1 in 10): the solution remains clear.
- **C.** With vigorous swirling, add 2 mL of acetone to the solution obtained in *Identification test B*: a heavy, milky turbidity develops immediately.
- **D.** To 1 mL of a solution (1 in 50), add 4 mL of alkaline cupric citrate TS. Boil vigorously for 2–4 min. Remove from heat, and allow the precipitate (if any) to settle: the supernatant is blue or blue-green.
- **E.** Meets the requirements for dextrose in *Procedure 2, Limit of Monomers*

ASSAY

PROCEDURE

Mobile phase: 0.001 N sulfuric acid. Pass through a filter of 0.5-μm or finer pore size, and degas.

Standard solution: 4.0 mg/mL of USP Polydextrose RS, calculated on the anhydrous and ash-free basis, in *Mobile phase*

Sample solution: 4.0 mg/mL of Hydrogenated Polydextrose, calculated on the anhydrous and ash-free basis, in *Mobile phase*

Analysis

Samples: 10 µL of the *Matrix modifier solution* was added into each of the 10-µL aliquots of the five *Standard solutions*, a mixture of 10 µL of the *Matrix modifier solution* and 10 µL of the *Sample solution*, and a mixture of 10 µL of the *Matrix modifier solution* and 10 µL of the *Spiked sample solution*

Concomitantly determine the absorbances of the *Samples* using the *Spectrometric conditions* described above. Plot the absorbance of each *Standard solution*, compensated for background correction, versus its content of lead, in µg/mL, and draw the best straight line fitting the five points. From this plot, determine the concentrations, C_T and C_{ST} , in µg/mL, of lead in the *Sample solution* and the *Spiked sample solution*, respectively.

Calculate the percentage recovery taken:

$$\text{Result} = [(C_{ST} - C_T)/A] \times 100$$

A = quantity of lead added to the *Spiked sample solution*, 0.1 µg/mL

Calculate the content, in µg/g, of lead in Hydrogenated Polydextrose taken:

$$\text{Result} = (C_T/W) \times V$$

W = weight of Hydrogenated Polydextrose taken to prepare the *Sample solution* (g)

V = volume of the *Sample solution*, 10 mL

Acceptance criteria: NMT 0.5 µg/g; recovery is 80%–120%

• **LIMIT OF NICKEL**

[NOTE—All glassware used must be soaked in 1% *Nitric acid* for at least 2 h and then rinsed with water.]

1% Nitric acid: Cautiously add 10 mL of nitric acid to a 1000-mL volumetric flask containing about 500 mL of water. Mix, and dilute with water to volume.

Blank solution: Use 1% *Nitric acid*.

Nickel stock standard solution: Immediately before use, dilute an appropriate amount of nickel standard* with 1% *Nitric acid* to prepare a solution containing the equivalent of 10 µg/mL of nickel.

Standard solutions: Into four identical 100-mL volumetric flasks, introduce respectively 1.0, 2.0, 5.0, and 10.0 mL of *Nickel stock standard solution*. Dilute with 1% *Nitric acid* to volume, and mix. These standards contain 0.1, 0.2, 0.5, and 1.0 µg/mL of nickel.

Sample solution: Weigh 5 g of Hydrogenated Polydextrose into a 100-mL volumetric flask. Dissolve in and dilute with 1% *Nitric acid* to volume, and mix.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with an air–acetylene flame

Lamp: Nickel hollow-cathode

Analytical wavelength: 352.0 nm

System suitability

Sample: *Standard solution* of 0.2 µg/mL of nickel

Suitability requirements

Relative standard deviation: NMT 20%

Analysis

Samples: *Standard solutions* and *Sample solution*

Use the *Blank solution* to zero the instrument.

Concomitantly determine the absorbances of the *Samples* at least three times each. Record the average of the steady readings for each of the *Samples*. Clear the nebulizer using the *Blank solution*, and aspirate each of the *Samples* in turn. The standard chosen for reslope should be run every four to five samples. If there is a significant change in its response, reslope and repeat the previous samples.

Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of nickel, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, C , in µg/mL, of nickel in the *Sample solution*. Calculate the quantity, in µg, of nickel in each g of Hydrogenated Polydextrose taken:

$$\text{Result} = (V \times C)/W$$

V = volume of the *Sample solution*, 100 mL

W = weight of Hydrogenated Polydextrose taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 2 µg/g

Organic Impurities

• **PROCEDURE 1: LIMIT OF 5-HYDROXYMETHYLFURFURAL AND RELATED COMPOUNDS**

Sample solution: 1.0 g of Hydrogenated Polydextrose, weighed and calculated on the anhydrous and ash-free basis, diluted with water to 100 mL

Analysis: Determine the absorbance of the *Sample solution* in a 1-cm quartz cell at 283 nm, with a suitable spectrophotometer, using water as the blank. Calculate the percentage of 5-hydroxymethylfurfural and related compounds in the Hydrogenated Polydextrose taken:

$$\text{Result} = (V \times M_r \times A)/(\epsilon_{283} \times L \times W) \times 100$$

V = volume of the *Sample solution*, 0.1 L

M_r = molecular weight of 5-hydroxymethylfurfural, 126 g/mol

A = absorbance of the *Sample solution*

ϵ_{283} = molar extinction coefficient of 5-hydroxymethylfurfural at a wavelength of 283 nm, 16,830 L · mol⁻¹ · cm⁻¹

L = path length of the spectrophotometer cell (cm)

W = weight of Hydrogenated Polydextrose taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1%

• **PROCEDURE 2: LIMIT OF MONOMERS**

Mobile phase, Sample solution, and Chromatographic system: Prepare as directed in the *Assay*.

Standard solution: 0.08 mg/mL of each for USP 1,6-Anhydro-D-glucose RS and USP Sorbitol RS, and 0.04 mg/mL of USP Dextrose RS, in *Mobile phase*

*Suitable nickel standards are available from e.g., Fisher Scientific, Fair Lawn, NJ (nickel, reference standard solution, 1000 ppm ±1%, certified, application for atomic absorption) or RICCA Chemical Company, Arlington, TX (nickel standard, 1000 ppm Ni, for atomic absorption).

System suitability**Sample:** *Standard solution*

[NOTE—See the relative retention times table below.]

Name	Relative Retention Time
Dextrose (glucose)	0.7
Sorbitol	0.8
An isomer of 1,6-anhydro-D-glucose (D-anhydroglucose furanose form)	0.9
1,6-Anhydro-D-glucose (levoglucosan) (D-anhydroglucose pyranose form)	1.0

Suitability requirements**Resolution:** NLT 1.0**Relative standard derivation:** NMT 5.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Use the peak response of USP 1,6-Anhydro-D-glucose RS in the *Standard solution* for calculation of the percentage of the isomer of 1,6-anhydro-D-glucose in the *Sample solution*. Calculate the percentage of each monomer in the portion of Hydrogenated Polydextrose taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for the respective monomer from the *Sample solution*

r_S = peak response for the respective monomer from the *Standard solution*

C_S = concentration of the respective standard monomer in the *Standard solution* (mg/mL)

C_U = concentration of Hydrogenated Polydextrose in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 4.0% of 1,6-anhydro-D-glucose, NMT 5.75% for sorbitol and NMT 0.25% for dextrose

[NOTE—In the case of 1,6-anhydro-D-glucose, the peak areas for the pyranose and furanose forms are combined.]

SPECIFIC TESTS**• MOLECULAR WEIGHT LIMIT**

Mobile phase: Dissolve 35.0 g of sodium nitrate and 1.0 g of sodium azide in 100 mL of water. Dilute with water to 4 L. Pass through a filter of 0.45- μ m or finer pore size, and degas by applying an aspirator vacuum for 30 min. The resulting *Mobile phase* is 0.1 N sodium nitrate containing 0.025% sodium azide.

Standard solution: Transfer 20 mg each of USP Dextrose RS, stachyose, and 5800-, 23,700-, and 100,000-molecular weight (MW) pullulan standards into a 10-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume. Pass through a syringe filter of 0.45- μ m or finer pore size into a suitable autosampler vial, and seal.

Sample solution: Transfer 50 mg of Hydrogenated Polydextrose into a 10-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume. Pass through a syringe filter of 0.45- μ m or finer pore size into a suitable autosampler vial, and seal.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index set at a sensitivity of 4×10^{-6} refractive index units full scale and maintained at a temperature of $35 \pm 0.1^\circ$

Column: 7.8-mm \times 30-cm; packing L39**Column temperature:** 45° **Flow rate:** 0.8 mL/min

[NOTE—After installation of a new column, pump

Mobile phase through the column overnight at a rate

of 0.3 mL/min. Before calibration or analysis, increase the flow slowly over a 1-min period to 0.8 mL/min. Continue to pump *Mobile phase* through the column at this flow rate for at least 1 h before the first injection. Check the flow gravimetrically, and adjust it if necessary. Reduce the flow rate to about 0.1 mL/min when the system is not in use.]

Injection size: 50 μ L**System suitability****Sample:** *Standard solution*

Chromatograph five replicate injections of the *Standard solution*, allowing 15 min between injections, and record the retention times of the components of the *Standard solution*.

Insert the average retention time along with the molecular weight of each component in the *Standard solution* into the calibration table of the molecular weight distribution software. Check the regression results for a cubic fit of the calibration points, and obtain a correlation coefficient, R, for the line.

Suitability requirements

Retention time: The retention times for each component determined on replicate injections agree within ± 2 s.

Resolution: Dextrose and stachyose are baseline resolved from one another and from the 5800-MW pullulan standard.

[NOTE—Prominent negative baseline valleys are usually observed between the peaks for the 5800-, 23,700-, and 100,000-MW pullulan standards.]

Correlation coefficient R: NLT 0.9999**Analysis****Samples:** *Standard solution* and *Sample solution*

Use the molecular weight distribution software of the data reduction system to generate a molecular weight distribution plot of Hydrogenated Polydextrose.

Acceptance criteria: No measurable peak above a molecular weight of 22,000 is found.

• **pH** <791>: 5.0–7.0, in a solution (1 in 10)

• **WATER DETERMINATION, Method I** <921>: NMT 4.0%. Use a mixture of Hydranal Solvent and Hydranal Formamide dry (2:1) as a solvent. Perform the titration at 50° in a jacketed beaker.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store in a cool and dry place.

• **USP REFERENCE STANDARDS** <11>
 USP 1,6-Anhydro-D-glucose RS
 USP Dextrose RS
 USP Polydextrose RS
 USP Sorbitol RS

Polyethylene Glycol

Poly(oxy-1,2-ethanediyl), α -hydro- ω -hydroxy-;
 Polyethylene glycol [25322-68-3].

DEFINITION

Polyethylene Glycol is an addition polymer of ethylene oxide and water, represented:

in which n represents the average number of oxyethylene groups. The average molecular weight is NLT 95.0% and NMT 105.0% of the labeled nominal value if the labeled nominal value is less than 1000; it is NLT 90.0% and NMT 110.0% of the labeled nominal value if the labeled

nominal value is between 1000 and 7000; and it is NLT 87.5% and NMT 112.5% of the labeled nominal value if the labeled nominal value is more than 7000. It may contain a suitable antioxidant.

ASSAY

• AVERAGE MOLECULAR WEIGHT

Phthalic anhydride solution: Place 49.0 g of phthalic anhydride into an amber bottle, and dissolve in 300 mL of pyridine from a freshly opened bottle or pyridine that has been freshly distilled over phthalic anhydride. Shake vigorously until completely dissolved. Add 7 g of imidazole, swirl carefully to dissolve, and allow to stand for 16 h before using.

Sample solution for liquid Polyethylene Glycols:

Carefully introduce 25.0 mL of the *Phthalic anhydride solution* into a dry, heat-resistant pressure bottle. Add an amount of the specimen equivalent to its expected average molecular weight divided by 160. Insert the stopper in the bottle, and wrap it securely in a cloth bag.

Sample solution for solid Polyethylene Glycols: Carefully introduce 25.0 mL of *Phthalic anhydride solution* into a dry, heat-resistant pressure bottle. Add an amount of the specimen equivalent to its expected molecular weight divided by 160; however, because of limited solubility, do not use more than 25 g. Add 25 mL of pyridine, from a freshly opened bottle or pyridine that has been freshly distilled over phthalic anhydride. Swirl to dissolve, insert the stopper in the bottle, and wrap it securely in a cloth bag.

Blank: 25.0 mL of *Phthalic anhydride solution* plus any additional pyridine added to the bottle

Analysis: Immerse the bottle in a water bath maintained at a temperature between 96° and 100°, to the same depth as that of the mixture in the bottle. Remove the bottles from the bath after 5 min and, without unwrapping, swirl for 30 s to homogenize. Heat in the water bath for 30 min (60 min for Polyethylene Glycols having molecular weights of 3000 or more), then remove from the bath, and allow it to cool to room temperature. Uncap the bottle carefully to release any pressure, remove from the bag, add 10 mL of water, and swirl thoroughly. Wait 2 min, add 0.5 mL of a solution of phenolphthalein in pyridine (1 in 100), and titrate with 0.5 N sodium hydroxide VS to the first pink color that persists for 15 s. Perform a blank determination.

Calculate the average molecular weight taken:

$$\text{Result} = (2000 \times W) / [(V_B - V_S) \times N]$$

W = weight of the Polyethylene Glycol taken for the *Sample solution* (g)
 V_B = volume of 0.5 N sodium hydroxide consumed by the *Blank* (mL)
 V_S = volume of 0.5 N sodium hydroxide consumed by the specimen (mL)
 N = normality of the sodium hydroxide solution
Acceptance criteria: See *Table 1*.

Table 1

Label Claim (Nominal Value)	Acceptance Criteria
<1000	95.0–105.0%
1000–7000	90.0–110.0%
>7000	87.5–112.5%

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 25 g

Analysis: Proceed as directed, using a platinum dish and moistening the residue with 2 mL of sulfuric acid.

Acceptance criteria: NMT 0.1%

• HEAVY METALS (231)

Test preparation: 4.0 g in 5.0 mL of 0.1 N hydrochloric acid. Dilute with water to 25 mL.

Acceptance criteria: NMT 5 ppm

• LIMIT OF FREE ETHYLENE OXIDE AND 1,4-DIOXANE

Stripped polyethylene glycol 400: Into a 5000-mL, 3-neck, round-bottom flask equipped with a stirrer, a gas dispersion tube, and a vacuum outlet, place 3000 g of Polyethylene Glycol 400. At room temperature, evacuate the flask carefully to a pressure of less than 1 mm of mercury, applying the vacuum slowly while observing for excessive foaming due to entrapped gases. After any foaming has subsided and while stirring continuously, sparge with nitrogen, allowing the pressure to rise to 10 mm of mercury. Continue stripping for a minimum of 1 h. Completeness of the stripping procedure should be verified by making a headspace injection of the stripped polyethylene glycol 400. [NOTE—The 10-mm value is a guideline. Deviations from this value affect only the total time required to strip the Polyethylene Glycol 400.]

Shut off the vacuum pump, and bring the flask pressure back to atmospheric pressure while maintaining nitrogen sparging. Remove the gas dispersion tube with the gas still flowing, and then turn off the gas flow. Transfer the *Stripped polyethylene glycol 400* to a suitable nitrogen-filled container.

Standard solution: Transfer 4.90 g of *Stripped polyethylene glycol 400* to a tared 22-mL pressure headspace vial that can be sealed. Add 48 µL of 1,4-dioxane, equivalent to 50 mg of 1,4-dioxane, from a syringe; seal; and cap the vial.

[CAUTION—Ethylene oxide and 1,4-dioxane are toxic and flammable. Prepare these solutions in a well-ventilated fume hood.]

Using the special handling described in the following, complete the preparation. Ethylene oxide is a gas at room temperature. It is usually stored in a lecture-type gas cylinder or small metal pressure bomb. Chill the cylinder in a refrigerator before use. Transfer 5 mL of the liquid ethylene oxide to a 100-mL beaker chilled in wet ice. Using a gas-tight syringe that has been chilled in a refrigerator, transfer 57 µL of the liquid ethylene oxide, equivalent to 50 mg of ethylene oxide, to the mixture contained in the headspace vial, and mix. With the aid of a syringe, transfer 2 mL of this solution to a 5-mL beaker. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Stripped polyethylene glycol 400* to volume. Transfer 10 mL of this solution to a 100-mL volumetric flask, dilute with *Stripped polyethylene glycol 400* to volume, and mix to obtain a *Standard solution* having known concentrations of 10 µg/g for both ethylene oxide and 1,4-dioxane. Transfer 1.0 mL of the *Standard solution* to a 22-mL pressure headspace vial, seal with a silicone septum with or without a pressure relief star spring and a pressure relief safety aluminum sealing cap, and crimp the cap closed with a cap-sealing tool.

System suitability solution: Transfer 4.90 g of *Stripped polyethylene glycol 400* to a 22-mL pressure headspace vial. Pipet 50 µL of acetaldehyde into the vial. Using the special handling described in *Standard solution*, transfer 50.0 µL of liquid ethylene oxide into the vial. Immediately seal the vial, and shake. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Stripped polyethylene glycol 400* to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with *Stripped polyethylene glycol 400* to volume. Transfer 1.0 mL of this *System suitability solution* to a 22-mL pressure headspace vial, and seal, cap, and crimp as directed for the *Standard solution*.

Sample solution: Transfer 1.0 g of Polyethylene Glycol to a 22-mL pressure headspace vial, and seal, cap, and crimp as directed for the *Standard solution*.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** Headspace GC (balanced pressure automatic headspace sampler)**Detector:** Flame ionization**Column:** 0.32-mm × 50-m fused-silica capillary column containing bonded phase G27 in a 5-μm film thickness**Temperature****Column:** See Table 2.**Table 2**

70	10	250	—

Injector: 85°**Detector:** 250°**Flow rate:** 2.9 mL/min**Carrier gas:** Helium**Injection size:** 1.0 mL of headspace using a 2-mL gas syringe preheated in an oven at 90°**System suitability****Sample:** *System suitability solution*

[NOTE—The relative retention times for acetaldehyde and ethylene oxide are about 0.9 and 1.0, respectively.]

Suitability requirements**Resolution:** NLT 1.3 between the acetaldehyde peak and the ethylene oxide peak**Analysis****Samples:** *Standard solution* and *Sample solution*

[NOTE—The relative retention times for ethylene oxide and 1,4-dioxane are about 1.0 and 3.4, respectively.]

Place the vials containing the *Standard solution* and the *Sample solution* into the automated sampler, and heat the vials at a temperature of 80° for 30 min. [NOTE—A headspace apparatus that automatically transfers the measured amount of headspace may be used to perform the injection.]**Acceptance criteria:** The peak areas for ethylene oxide and 1,4-dioxane of the *Sample solution* are not greater than those of the corresponding peaks of the *Standard solution* corresponding to NMT 10 μg/g of ethylene oxide and NMT 10 μg/g of 1,4-dioxane.

- **LIMIT OF ETHYLENE GLYCOL AND DIETHYLENE GLYCOL** (for Polyethylene Glycol having a nominal molecular weight less than 450)

Standard solution: 0.5 mg/mL each of ethylene glycol and of diethylene glycol in water**Sample solution:** 400 mg/mL of Polyethylene Glycol in water**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** GC**Detector:** Flame ionization**Column:** 3-mm × 1.5-m stainless steel; packing of 12% G13 on support S1NS**Temperature****Column:** 140°**Injector port:** 250°**Detector:** 280°**Carrier gas:** Nitrogen or another suitable inert gas**Flow rate:** 50 mL/min**Injection size:** 2.0 μL**Analysis****Samples:** *Standard solution* and *Sample solution*

[NOTE—The elution order is ethylene glycol followed by diethylene glycol.]

Calculate the percentage of ethylene glycol in the portion of Polyethylene Glycol taken:

$$\text{Result} = (r_{U1}/r_{S1}) \times (C_{S1}/C_U) \times 100$$

 r_{U1} = peak height of ethylene glycol from the *Sample solution* r_{S1} = peak height of ethylene glycol from the *Standard solution* C_{S1} = concentration of ethylene glycol in the *Standard solution* (mg/mL) C_U = concentration of Polyethylene Glycol in the *Sample solution* (mg/mL)

Calculate the percentage of diethylene glycol in the portion of Polyethylene Glycol taken:

$$\text{Result} = (r_{U2}/r_{S2}) \times (C_{S2}/C_U) \times 100$$

 r_{U2} = peak height of diethylene glycol from the *Sample solution* r_{S2} = peak height of diethylene glycol from the *Standard solution* C_{S2} = concentration of diethylene glycol in the *Standard solution* (mg/mL) C_U = concentration of Polyethylene Glycol in the *Sample solution* (mg/mL)**Acceptance criteria:** NMT 0.25% of the sum of ethylene glycol and diethylene glycol is found.

- **LIMIT OF ETHYLENE GLYCOL AND DIETHYLENE GLYCOL** (for Polyethylene Glycol having a nominal molecular weight 450 or more but NMT 1000)

Ceric ammonium nitrate solution: 6.25 g of ceric ammonium nitrate in 100 mL of 0.25 N nitric acid. Use within 3 days.**Standard stock solution:** 2.5 mg/mL of diethylene glycol in 1:1 freshly distilled acetonitrile:water**Sample stock solution:** Dissolve 50.0 g of Polyethylene Glycol in 75 mL of diphenyl ether, previously warmed if necessary, just to melt the crystals, in a 250-mL distilling flask. Slowly distill at a pressure of 1–2 mm of mercury, into a receiver graduated to 100 mL in 1-mL subdivisions, until 25 mL of distillate has been collected. Add 20.0 mL of water to the distillate, shake vigorously, and allow the layers to separate. Cool in an ice bath to solidify the diphenyl ether and facilitate its removal. Filter the separated aqueous layer, wash the diphenyl ether with 5.0 mL of ice-cold water, pass the washings through the filter, and collect the filtrate and washings in a 25-mL volumetric flask. Warm to room temperature, and dilute with water to volume, if necessary. Mix this solution with 25.0 mL of freshly distilled acetonitrile in a glass-stoppered, 125-mL conical flask.**Standard solution:** Add 10.0 mL of the *Standard stock solution* to 15.0 mL of *Ceric ammonium nitrate solution*. Within 2–5 min, determine the absorbance of the *Standard solution*.**Sample solution:** Add 10.0 mL of the *Sample stock solution* to 15.0 mL of *Ceric ammonium nitrate solution*. Within 2–5 min, determine the absorbance of the *Sample solution*.**Blank:** Mixture of 15.0 mL of *Ceric ammonium nitrate solution* and 10.0 mL of 1:1 freshly distilled acetonitrile:water**Instrumental conditions**(See *Spectrophotometry and Light-Scattering* (851).)**Mode:** UV-Vis**Cell:** 1 cm**Analytical wavelength:** 450 nm**Analysis****Samples:** *Standard solution* and *Sample solution***Acceptance criteria:** The absorbance of the *Sample solution* does not exceed that of the *Standard solution*, corresponding to NMT 0.25% of combined ethylene glycol and diethylene glycol.

SPECIFIC TESTS• **PH** (791)

Sample solution: 5.0 g of Polyethylene Glycol in 100 mL of carbon dioxide-free water. Add 0.30 mL of saturated potassium chloride solution.

Acceptance criteria: 4.5–7.5

- **COMPLETENESS AND COLOR OF SOLUTION:** A solution of 5 g of Polyethylene Glycol in 50 mL of water is colorless; it is clear for liquid grades and NMT slightly hazy for solid grades.

• **VISCOSITY—CAPILLARY VISCOMETER METHODS (911):**

Determine its viscosity by using a capillary viscometer giving a flow time of NLT 200 s and using a liquid bath maintained at $98.9 \pm 0.3^\circ$ (210° F). The viscosity is within the limits specified in Table 3. For a Polyethylene Glycol not listed in the table, calculate the limits by interpolation.

Table 3

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to state, as part of the official title, the average nominal molecular weight of the Polyethylene Glycol. Label it to indicate the name and quantity of any added antioxidant.

Polyethylene Glycol Ointment**DEFINITION**

Prepare Polyethylene Glycol Ointment as follows.

Polyethylene Glycol 3350	400 g
Polyethylene Glycol 400	600 g
To make	1000 g

Heat the two ingredients on a water bath to 65° . Allow to cool, and stir until congealed. If a firmer preparation is desired, replace up to 100 g of the *Polyethylene Glycol 400*

with an equal amount of *Polyethylene Glycol 3350*.

[NOTE—If 6%–25% of an aqueous solution is to be incorporated in the Ointment, replace 50 g of the *Polyethylene Glycol 3350* with an equal amount of stearyl alcohol.]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in well-closed containers.

Polyethylene Glycol Monomethyl Ether

Poly(oxy-1,2-ethanediyl), α -methyl- ω -hydroxy-; Methoxy polyethylene glycol [9004-74-4].

DEFINITION

Polyethylene Glycol Monomethyl Ether is an addition polymer of ethylene oxide and methanol, represented as:

in which n represents the average number of oxyethylene groups. The average molecular weight is NLT 95.0% and NMT 105.0% of the labeled nominal value if the labeled nominal value is below 1000; it is NLT 90.0% and NMT 110.0% of the labeled nominal value if the labeled nominal value is between 1000 and 4750; and it is NLT 87.5% and NMT 112.5% of the labeled nominal value if the labeled nominal value is above 4750.

ASSAY• **AVERAGE MOLECULAR WEIGHT**

Phthalic anhydride solution: Place 49.0 g of phthalic anhydride into an amber bottle, and dissolve in 300 mL of pyridine, either from a freshly opened bottle or freshly distilled over phthalic anhydride. Shake vigorously until completely dissolved. Add 7 g of imidazole, swirl carefully to dissolve, and allow to stand for 16 h before using.

Sample solution for liquid Polyethylene Glycol Monomethyl Ethers: Carefully introduce 25.0 mL of the *Phthalic anhydride solution* into a dry, heat-resistant pressure bottle. Add a weighed amount of the sample, equivalent to its expected average molecular weight divided by 80. Insert the stopper in the bottle, and wrap it securely in a cloth bag.

Sample solution for solid Polyethylene Glycol Monomethyl Ethers: Carefully introduce 25.0 mL of *Phthalic anhydride solution* into a dry, heat-resistant pressure bottle. Add an amount of the sample, equivalent to its expected molecular weight divided by 80; however, because of limited solubility, do not use more than 25 g. Add 25 mL of pyridine, either from a freshly opened bottle or freshly distilled over phthalic anhydride, swirl to dissolve, insert the stopper in the bottle, and wrap it securely in a cloth bag.

Analysis: Immerse the bottle in a water bath maintained at 96° – 100° to the same depth as that of the mixture in the bottle. Remove the bottle from the bath after 5 min, and without unwrapping, swirl for 30 s to homogenize. Heat in the water bath for 30 min (60 min for Polyethylene Glycol Monomethyl Ethers having molecular weights of 3000 or higher), then remove from the bath, and allow to cool to room temperature. Uncap the bottle carefully to release any pressure, remove from the bag, add 10 mL of water, and swirl thoroughly. Wait for 2 min, add 0.5 mL of a solution of phenolphthalein in pyridine (1 in 100). Titrate with 0.5 N sodium hydroxide VS to the first pink color that persists for 15 s, recording the volume, in mL, of 0.5 N

sodium hydroxide required as V_S . Perform a blank determination on 25.0 mL of *Phthalic anhydride solution* plus any additional pyridine added to the bottle, and record the volume, in mL, of 0.5 N sodium hydroxide required as V_B .

Calculate the average molecular weight:

$$\text{Result} = (1000 \times W) / [(V_B - V_S) \times N]$$

W = weight of Polyethylene Glycol Monomethyl Ether taken for the *Sample solution* (g)
 V_B = volume of 0.5 N sodium hydroxide consumed by the blank (mL)
 V_S = volume of 0.5 N sodium hydroxide consumed by the sample (mL)
 N = normality of the sodium hydroxide solution
Acceptance criteria: See *Table 1*.

Table 1

Label Claim (nominal value)	Acceptance Criteria (%)
<1000	95.0–105.0
1000–4750	90.0–110.0
>4750	87.5–112.5

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 25 g of Polyethylene Glycol Monomethyl Ether, moistened with 2 mL of sulfuric acid in a platinum dish

Acceptance criteria: NMT 0.1%

• HEAVY METALS (231)

Test preparation: Mix 4.0 g with 5.0 mL of 0.1 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 5 ppm

• LIMIT OF ETHYLENE GLYCOL AND DIETHYLENE GLYCOL (for Polyethylene Glycol Monomethyl Ether having a nominal molecular weight of less than 600)

Standard solution: 500 µg/mL of ethylene glycol and 500 µg/mL of diethylene glycol in water

Sample solution: 400 mg/mL of Polyethylene Glycol Monomethyl Ether in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 3-mm × 1.0-m; 60- to 80-mesh support S2

Temperatures

Column: 200°

Injection port: 260°

Carrier gas: Nitrogen or another suitable inert gas

Flow rate: 20 mL/min

Injection volume: 1.0 µL

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—The elution order is ethylene glycol, diethylene glycol, and polyethylene glycol monomethyl ether.]

Calculate the percentage of ethylene glycol and diethylene glycol in the portion of Polyethylene Glycol Monomethyl Ether taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak height of ethylene glycol or diethylene glycol from the *Sample solution*

r_S = peak height of ethylene glycol or diethylene glycol from the *Standard solution*

C_S = concentration of ethylene glycol or diethylene glycol in the *Standard solution*

C_U = concentration of Polyethylene Glycol Monomethyl Ether in the *Sample solution*

Acceptance criteria: NMT 0.25% of combined ethylene glycol and diethylene glycol

• LIMIT OF ETHYLENE GLYCOL AND DIETHYLENE GLYCOL (for Polyethylene Glycol Monomethyl Ether having a nominal molecular weight of 600–1500)

Solution A: 62.5 mg/mL of ceric ammonium nitrate in 0.25 N nitric acid. Use within 3 days.

Solution B: Freshly distilled acetonitrile and water (50:50)

Standard solution: 2.5 mg/mL of diethylene glycol in *Solution B*

Sample solution: Dissolve 50.0 g of Polyethylene Glycol Monomethyl Ether in 75 mL of diphenyl ether, previously warmed if necessary, to melt the crystals, in a 250-mL distilling flask. Slowly distill at a pressure of 1–2 mm of mercury into a receiver graduated to 100 mL in 1-mL subdivisions until 25 mL of distillate has been collected. Add 20.0 mL of water to the distillate, shake vigorously, and allow the layers to separate. Cool in an ice bath to solidify the diphenyl ether and facilitate its removal. Filter the separated aqueous layer, wash the diphenyl ether with 5.0 mL of ice-cold water, pass the washings through the filter, and collect the filtrate and washings in a 25-mL volumetric flask. Warm to room temperature, and dilute with water to volume, if necessary. Mix this solution with 25.0 mL of freshly distilled acetonitrile in a glass-stoppered, 125-mL conical flask.

Instrumental conditions

Mode: Vis

Analytical wavelength: About 450 nm

Cell: 1 cm

Blank: *Solution A* and *Solution B* (60:40)

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*. Transfer 10.0 mL each of the *Standard solution* and the *Sample solution* to separate 50-mL flasks, each containing 15.0 mL of *Solution A*. Within 2–5 min, determine the absorbances of the *Samples*.

Acceptance criteria: The absorbance of the *Sample solution* does not exceed that of the *Standard solution*, corresponding to NMT 0.25% of combined ethylene glycol and diethylene glycol.

• FREE ETHYLENE OXIDE AND 1,4-DIOXANE

Stripped MPEG 350: Into a 5000-mL 4-neck, round-bottom flask, equipped with a stirrer, a thermometer, a gas dispersion tube, a dry ice trap, a vacuum outlet, and a heating mantle, place 3000 g of Polyethylene Glycol Monomethyl Ether 350. At room temperature, evacuate the flask carefully to a pressure of less than 1 mm of mercury, applying the vacuum slowly while observing for excessive foaming due to entrapped gases. After any foaming has subsided, sparge with nitrogen, allowing the pressure to rise to 10 mm of mercury. Heat the flask to 130° while increasing the pressure to 60 mm of mercury. Continue stripping for 4 h, then cool to room temperature. Shut off the vacuum pump, and bring the flask pressure back to atmospheric pressure while maintaining nitrogen sparging. Remove the sparging tube with the gas still flowing, then turn off the gas flow. Transfer the *Stripped MPEG 350* to a suitable nitrogen-filled container.

Standard solutions: [CAUTION—Ethylene oxide and 1,4-dioxane are toxic and flammable. Prepare these solutions in a well-ventilated fume hood.] To a known weight of *Stripped MPEG 350* in a vial that can be sealed add a suitable quantity of 1,4-dioxane. Determine the amount added by weight difference. Using the special handling described in the following, complete the preparation. Ethylene oxide is a gas at room temperature. It is usually stored in a lecture-type gas cylinder or small metal pressure bomb. Chill the cylinder in a refrigerator before use. Transfer 5 mL of the liquid ethylene oxide to a 100-mL beaker chilled in wet ice. Using a gas-tight gas chromatographic syringe that has been chilled in a refrigerator, transfer a suitable amount of the liquid ethylene oxide into the mixture.

Immediately seal the vial, and shake. Determine the amount added by weight difference. By appropriate dilution with *Stripped MPEG 350*, prepare four solutions, covering a range of 5–20 ppm for the two components added to the matrix (e.g., 5, 10, 15, and 20 ppm). Transfer 1.0 mL of each of these solutions to separate 22-mL pressure headspace vials. Seal each with a silicone septum, star spring, and pressure relief safety aluminum sealing cap. Crimp the cap closed with a cap-sealing tool.

Sample solution: Transfer 1 ± 0.01 g of Polyethylene Glycol Monomethyl Ether to a 22-mL pressure headspace vial. Seal, cap, and crimp as directed for the *Standard solutions*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC (equipped with a balanced pressure automatic headspace sampler)

Detector: Flame ionization

Column: 50-m \times 0.32-mm fused silica; bonded phase G27 in a 5- μ m film thickness

Temperatures

Detector: 250°

Transfer line: 140°

Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	10	250	—

Carrier gas: Helium

Flow rate: 0.8 mL/min

Calibration: Place the vials containing the *Standard solutions* in the automated sampler, and start the sequence so that each vial is heated at 110° for 30 min before a suitable portion of its headspace is injected into the chromatograph. Set the automatic sampler for a needle withdrawal time of 0.3 min, a pressurization time of 1 min, an injection time of 0.08 min, and a vial pressure of 22 psig with the vial vent off. Obtain the peak areas for ethylene oxide and 1,4-dioxane, which have relative retention times of 1.0 and 3.1, respectively. Plot the area versus parts per million on linear graph paper, and draw the best straight line through the points. On the two *Calibration* plots, no point digresses from its line by more than 10%.

Analysis: Place the vial containing the *Sample solution* in the automatic sampler, and chromatograph its headspace as done for the *Standard solutions*. Obtain the peak areas of each of the components, and read the concentrations directly from the *Calibration* plots.

Acceptance criteria: NMT 10 ppm of ethylene oxide or 1,4-dioxane

• LIMIT OF 2-METHOXYETHANOL

Stripped MPEG 350 and Sample solution: Prepare as directed in the test for *Free Ethylene Oxide and 1,4-Dioxane*.

Standard solutions: [CAUTION—2-Methoxyethanol is toxic and flammable. Prepare these solutions in a well-ventilated fume hood.] To a known weight of *Stripped MPEG 350* in a vial that can be sealed add a suitable quantity of 2-methoxyethanol. Determine the amount added by weight difference. By appropriate dilution with *Stripped MPEG 350*, prepare four solutions, covering a range of 5–20 ppm (e.g., 5, 10, 15, and 20 ppm). Transfer 1.0 mL of each of these solutions to separate 22-mL pressure headspace vials. Seal each with a silicone septum, star spring, and pressure relief safety aluminum sealing cap. Crimp the cap closed with a cap-sealing tool.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC (equipped with a balanced pressure automatic headspace sampler)

Detector: Flame ionization

Column: 15-m \times 0.53-mm fused silica capillary; bonded phase G16 in a 1- μ m film thickness

Temperatures

Detector: 275°

Transfer line: 140°

Column: See *Table 3*.

Table 3

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	—	50	2
70	10	250	—

Carrier gas: Helium

Flow rate: 15 mL/min

Calibration: Place the vials containing the *Standard solutions* in the automated sampler, and start the sequence so that each vial is heated at 100° for 20 min before a suitable portion of its headspace is injected into the chromatograph. Set the automatic sampler for a needle withdrawal time of 0.3 min, a pressurization time of 1 min, an injection time of 0.08 min, and a vial pressure of 22 psig with the vial vent off. Obtain the peak area for 2-methoxyethanol. Plot the area versus ppm on linear graph paper, and draw the best straight line through the points. On the two *Calibration* plots, no point digresses from its line by more than 10%.

Analysis: Place the vial containing the *Sample solution* in the automatic sampler, and chromatograph its headspace as done for the *Standard solutions*. Obtain the peak area, and read the concentration directly from the *Calibration* plot.

Acceptance criteria: NMT 10 ppm

SPECIFIC TESTS

• pH <791>

Sample solution: 5.0 g of Polyethylene Glycol Monomethyl Ether in 100 mL of carbon dioxide-free water. Add 0.30 mL of saturated potassium chloride solution.

Acceptance criteria: 4.5–7.5

• COMPLETENESS AND COLOR OF SOLUTION

Sample solution: 5 g of Polyethylene Glycol Monomethyl Ether in 50 mL of water

Acceptance criteria: The resulting solution is colorless, and is clear for liquid grades and NMT slightly hazy for solid grades.

• VISCOSITY—CAPILLARY VISCOMETER METHODS <911>:

Determine its viscosity, using a capillary viscometer giving a flow time of NLT 200 s and a liquid bath maintained at $98.9 \pm 0.3^\circ$. The viscosity is within the limits specified in *Table 4*. For a Polyethylene Glycol Monomethyl Ether not listed in *Table 4*, calculate the limits by interpolation.

Table 4

Nominal Average Molecular Weight	Viscosity Range (centistokes)	Nominal Average Molecular Weight	Viscosity Range (centistokes)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to state, as part of the official title, the average nominal molecular weight of the Polyethylene Glycol Monomethyl Ether.

Polyethylene Oxide

**DEFINITION**

Polyethylene Oxide is a nonionic homopolymer of ethylene oxide, represented:

in which *n* represents the average number of oxyethylene groups. The number *n* varies from about 2000 to 200,000. It is a white to off-white powder obtainable in several grades, varying in viscosity profile in an aqueous isopropyl alcohol solution. It may contain a suitable antioxidant.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
Sample: Previously dried in a vacuum at room temperature to constant weight
- **B. PROCEDURE**
Viscosity
 [NOTE—Based on *Labeling* information, perform the following test accordingly.]
Analysis: Pass Polyethylene Oxide through a 20-mesh screen. Then transfer Polyethylene Oxide to a 800-mL low-form beaker the amount which is specified in *Table 1* to provide the solution concentration.

Table 1

Polyethylene oxide weight	Sample solution		
	1% Solution	2% Solution	5% Solution
	6 g	12 g	30 g

Add 125 mL of dehydrated isopropyl alcohol to the beaker. Place the stirrer into the beaker with an appropriate glass cover. Stir the polyethylene oxide-isopro-

panol mixture at a rate to ensure that a slurry is formed. Add the prescribed amount of water to the polyethylene oxide-isopropanol slurry, refer to *Table 2*. All solution concentrations are based on the water content of the aqueous isopropyl alcohol solution. Be careful to avoid splashing of the water. Adjust the temperature to near 25° to assist the final solution coming to temperature.

Table 2

Water weight	Sample solution		
	1% Solution	2% Solution	5% Solution
	594 g	588 g	570 g

Ensure that the stirring is very effective at the beginning for about 1 min. Then allow to gently stir for at least 3 h. Ensure that Polyethylene Oxide dissolves in solution, take care to avoid mixing in excess air, and stop the stirring. [NOTE—Ensure a colloidal dispersion by stirring for at least 3 h if added antioxidant or silicon dioxide is not soluble in the system.]

Place a watchglass over the beaker and place in a bath for at least 30 min. When the solution reaches 25 ± 0.1°, determine the viscosity of the *Sample solution* using the viscometer, spindle, and speed indicated on the *Labeling*. [NOTE—A guard may be required as indicated on the *Labeling*.] Follow the instrument manufacturer's directions to measure the apparent viscosity.

Acceptance criteria: Viscosity falls within the viscosity range indicated by the *Labeling*.

IMPURITIES**Inorganic Impurities**

- **HEAVY METALS,** *Method II* (231):NMT 10 ppm
- **SILICON DIOXIDE AND NONSILICON DIOXIDE RESIDUE ON IGNITION**

Sample: 1 g

Analysis: Weigh the *Sample* into a previously ignited, tared 50-mL platinum crucible. Add 4 drops of sulfuric acid. Heat carefully on a hot plate until the specimen is thoroughly charred and fumes no longer are evolved. Ignite the crucible at 700 ± 25° (see *Residue on Ignition* (281)) to constant weight. Wet the residue carefully with 1 mL of water, and slowly add 20 drops of hydrofluoric acid. [CAUTION—Hydrofluoric acid is an extremely hazardous chemical. When handling it, wear a face shield, arm protection, and rubber gloves, and perform the operation in a hood.] Evaporate slowly on a hot plate to dryness, then ignite at 700 ± 25° for 10 min, cool to room temperature in a desiccator, and weigh. Repeat the addition of hydrofluoric acid, evaporation, and ignition, to constant weight.

Calculate the percentage of silicon dioxide residue on ignition from the difference between the net weights before and after the hydrofluoric acid treatment. Calculate the percentage of nonsilicon dioxide residue on ignition from the final net weight.

Acceptance criteria

Silicon dioxide residue on ignition: NMT 3%

Nonsilicon dioxide residue on ignition: NMT 2%

Organic Impurities

- **PROCEDURE: LIMIT OF FREE ETHYLENE OXIDE**

Standard stock solution: [CAUTION—Ethylene oxide is toxic and flammable. Prepare solutions of it in a well-ventilated fume hood.] Prepare the solution using the special handling described below. Ethylene oxide is a gas at room temperature. It is usually stored in a lecture-type gas cylinder or small metal pressure bomb. Chill the cylinder in a refrigerator before use. Transfer 5 mL of the liquid ethylene oxide to a cold, 10-mL serum vial. Seal the vial, and store in a refrigerator. Transfer 40 g of acetone to a tared 50-mL serum vial that is capable of being tightly sealed with a polytetrafluoroethylene-lined septum and a metallic crimp cap. Seal the vial, and weigh

it. Using a gas-tight gas chromatographic syringe that has been chilled in a refrigerator, transfer 60 μL of the liquefied ethylene oxide to the same vial. Weigh the vial, and determine the amount added by weight difference. The solution contains about 1 $\mu\text{g}/\mu\text{L}$ of ethylene oxide. [NOTE—This solution may be kept for 1 week in the crimp-sealed serum vial, stored in a freezer.]

[NOTE—Standard solutions A–D and the Sample solution should be prepared in vials designed for use in the headspace sampling system specified in the *Chromatographic system*.]

Standard solution A: To a tared vial add 1.0 g of Polyethylene Oxide, and seal the vial. Through the septum add 2.0 μL of *Standard stock solution*, heat the vial at 100° for 30 min, and cool to room temperature.

Standard solution B: To a tared vial add 1.0 g of Polyethylene Oxide, and seal the vial. Through the septum add 4.0 μL of *Standard stock solution*, heat the vial at 100° for 30 min, and cool to room temperature.

Standard solution C: To a tared vial add 1.0 g of Polyethylene Oxide, and seal the vial. Through the septum add 6.0 μL of *Standard stock solution*, heat the vial at 100° for 30 min, and cool to room temperature.

Standard solution D: To a tared vial add 1.0 g of Polyethylene Oxide, and seal the vial. Through the septum add 8.0 μL of *Standard stock solution*, heat the vial at 100° for 30 min, and cool to room temperature.

Sample solution: To a tared vial add 1.0 g of Polyethylene Oxide, and seal the vial. Heat the vial at 100° for 30 min, and cool to room temperature.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm \times 10-m capillary column bonded with a 20- μm layer of phase G45

Temperature

Injector: 200°

Detector: 250°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	5
70	10	200	5

Flow rate: 15 mL/min

Injection size: 300 μL of headspace gas

Injection type: Split

Carrier gas: Helium

[NOTE—The makeup gas is also helium, with a split flow rate of 15 mL/min.]

System suitability

Samples: *Standard stock solution* and *Standard solution C*

Suitability requirements

Relative standard deviation: NMT 5%. [NOTE—Multiple vials are prepared for replicate injections.]

Analysis

Samples: *Standard solutions A–D* and *Sample solution*
[NOTE—A headspace apparatus that automatically transfers the measured amount of gaseous headspace may be used to perform the injections.]

Using a gas-tight syringe, separately inject equal volumes (about 300 μL) of the gaseous headspace of each of the *Standard solutions* and the *Sample solution* into the gas chromatograph, record the chromatograms, and measure the areas of the peak responses. Determine by a retention time comparison whether

ethylene oxide is detected in the *Sample solution*. Plot the responses of the *Sample solution* and the *Standard solutions* versus the content, in μg , of ethylene oxide in each vial, as furnished by the *Standard stock solution*. Draw the straight line best fitting the five points, and calculate the correlation coefficient for the line.

[NOTE—The content of ethylene oxide, as furnished by the *Standard stock solution*, is 0 μg in the *Sample solution*.]

A suitable system is one that yields a line having a correlation coefficient of NLT 0.99. Extrapolate the line until it intercepts the content axis on the negative side. From the intercept, determine the total amount, T_U , in μg , of ethylene oxide in the *Sample solution*.

Calculate the percentage of ethylene oxide in the portion of Polyethylene Oxide taken:

$$\text{Result} = (T_U/W) \times 100$$

T_U = total amount of ethylene oxide in the *Sample solution* (μg)

W = weight of Polyethylene Oxide taken to prepare the *Sample solution* (μg)

Acceptance criteria: NMT 0.001%

SPECIFIC TESTS

- **LOSS ON DRYING** <731>: Dry 4 g at 105° for 45 min: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No storage requirements specified.
- **LABELING:** Label it to indicate the viscosity and acceptable limits, giving the viscosity measurement parameters, concentration of the solution, and the type of equipment used. Label it to indicate the name and quantity of any added antioxidant.
- **USP REFERENCE STANDARDS** <11>
USP Polyethylene Oxide RS

Polyglyceryl Dioleate

$\text{R} = \text{H}$, or $\text{CO}-\text{C}_{17}\text{H}_{33}$

1,2,3-Propanetriol, homotrimer, di[(9Z)-9-octadecenoate]; Triglyceril dioleate;

Polyglyceryl 3 dioleate [9007-48-1].

$\text{R} = \text{H}$, or $\text{CO}-\text{C}_{17}\text{H}_{33}$

1,2,3-Propanetriol, homohexamer, di[(9Z)-9-octadecenoate]; Hexaglyceril dioleate;

Polyglyceryl 6 dioleate [76009-37-5].

DEFINITION

Polyglyceryl Dioleate is a mixture of polyglyceryl diesters of mainly oleic acid, obtained by esterification of polyglycerin and oleic acid. The polyglycerin consists mainly of triglycerin or hexaglycerin.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>
- **B.** Meets the requirements of the test for *Content of Fatty Acids*
- **C.** Meets the requirements of the test for *Fats and Fixed Oils* <401>, *Hydroxyl Value*. [NOTE—This test will differentiate for Polyglyceryl 3 Dioleate and Polyglyceryl 6 Dioleate.]

ASSAY**• CONTENT OF FATTY ACIDS**

0.5 N methanolic sodium hydroxide solution: Dissolve 20 g of sodium hydroxide in 50 mL of water, and mix. Cool to room temperature, and add 950 mL of methanol.

Boron trifluoride methanol solution: Dissolve 14 g of boron trifluoride in methanol to make 100 mL, and mix well.¹

Saturated sodium chloride solution: Dissolve about 375 g of sodium chloride in water to make 1000 mL.

Standard solution: Prepare the calibration ester mixture by mixing up each individual ester component (see Table 1 for the component's composition). Dissolve 500 mg of the calibration ester mixture in *n*-heptane, and dilute with *n*-heptane to 50 mL. [NOTE—Commercially available mixtures of fatty acid methyl esters may also be used.]

Table 1

Component in the Calibration Ester Mixture	Composition (%)
USP Methyl Myristate RS (C14:0)	5
USP Methyl Palmitate RS (C16:0)	15
USP Methyl Palmitoleate RS (C16:1)	10
USP Methyl Stearate RS (C18:0)	10
USP Methyl Oleate RS (C18:1)	20
USP Methyl Linoleate RS (C18:2)	15
USP Methyl Linolenate RS (C18:3)	10
Methyl arachidate (C20:0)	10
Methyl gadoleate (C20:1)	5

Sample solution: Introduce 100 mg of Polyglyceryl Dioleate into a 25-mL conical flask fitted with a suitable water-cooled reflux condenser and a magnetic stir bar. Add 2 mL of 0.5 N methanolic sodium hydroxide solution, mix, and reflux for about 30 min. Add 2 mL of Boron trifluoride methanol solution through the condenser and reflux for about 30 min. Add 4 mL of *n*-heptane through the condenser, and reflux for 5 min. Cool, remove the condenser, add about 10 mL of Saturated sodium chloride solution, shake, add a quantity of Saturated sodium chloride solution to bring the upper layer up to the neck of the flask, and allow the layers to separate. Collect 2 mL of the *n*-heptane layer (upper layer), wash with three quantities, each at 2 mL of water, and dry the *n*-heptane phase over anhydrous sodium sulfate.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica capillary; 0.25-μm layer of phase G16

Temperature

Detector: 250°

Injection port: 240°

Column: See temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	6	250	6

¹ Boron trifluoride-methanol solution (14% in methanol) is also commercially available from Sigma, B-1252, or equivalent quality.

Carrier gas: Nitrogen

Flow rate: 1.0–1.2 mL/min

Injection size: 1 μL

Injection type: Split injection. The split ratio is about 1:80.

System suitability

Sample: Standard solution

[NOTE—See the relative retention time table below.]

Component	Relative Retention Time
Methyl myristate	0.74
Methyl palmitate	1.00
Methyl palmitoleate	1.03
Methyl stearate	1.29
Methyl oleate	1.33
Methyl linoleate	1.37 ^a
Methyl linolenate	1.46 ^b
Methyl arachidate	1.55
Methyl gadoleate	1.58

^a There could be an isomer eluting at a relative retention time of 1.39.

^b There could be two isomers eluting at relative retention times of 1.45 and 1.48.

Suitability requirements

Resolution: NLT 1.5 between the peaks due to methyl stearate and methyl oleate

Relative standard deviation: NMT 6.0% for the palmitate and stearate peak areas

Analysis

Samples: Standard solution and Sample solution

Identify the fatty acid ester peaks of the Sample solution by comparing the retention times of these peaks with those of the Standard solution, and measure the peak areas for all of the fatty acid esters in the Sample solution.

Calculate the percentage of each fatty acid ester component in the test specimen:

$$\text{Result} = (A/B) \times 100$$

A = peak area of each individual fatty acid ester component

B = sum of the peak areas, excluding the solvent peak, of the Sample solution

Acceptance criteria: Polyglyceryl Dioleate exhibits the following composition profile of fatty acids.

Carbon-Chain Length	Number of Double Bonds	Percentage
14	0	≤5.0
16	0	2.0–16.0
16	1	≤8.0
18	0	≤6.0
18	1	65.0–88.0
18	2	5.0–18.0 ^a
18	3	≤4.0 ^a
Sum of fatty acids with C >18	0	≤4.0

^a The content of C18:2 or C18:3 is the content of each fatty acid with its respective isomers.

IMPURITIES**Inorganic Impurities****• RESIDUE ON IGNITION**

Analysis: Heat a silica crucible to redness for 30 min, allow to cool in a desiccator, and weigh. Evenly distribute about 1.0 g of Polyglyceryl Dioleate in the crucible, and weigh. Dry at 100°–105° for 1 h, and ignite in a muffle furnace at 600 ± 25°, until the test

substance is thoroughly charred. Perform the test for *Residue on Ignition* (281) on the residue obtained, starting with "Moisten the sample with a small amount (usually 1 mL) of sulfuric acid."

Acceptance criteria: NMT 1%

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm

SPECIFIC TESTS

• ACID VALUE

Analysis: Accurately weigh (to within 0.1 mg) 5–10 g of Polyglyceryl Dioleate, add 10 mL of alcohol and 3 drops of phenolphthalein TS, and titrate with 0.1 N potassium hydroxide VS or 0.1 N sodium hydroxide VS until the solution remains faintly pink after shaking for 30 s. Proceed as directed in *Fats and Fixed Oils* (401), *Acid Value* to perform the calculation.

Acceptance criteria

Polyglyceryl 3 dioleate: NMT 6

Polyglyceryl 6 dioleate: NMT 6

- **FATS AND FIXED OILS**, *Hydroxyl Value* (401)

Acceptance criteria

Polyglyceryl 3 dioleate: 195–245, determined on a 0.7-g to 1.0-g specimen

Polyglyceryl 6 dioleate: 270–320, determined on 0.5-g to 0.7-g specimen

• IODINE VALUE

Analysis: Accurately weigh 0.15 g of Polyglyceryl Dioleate, transfer to a dry 250-mL flask with a ground-glass stopper, and add 25 mL of methylene chloride. Add 20 mL of the Wijs' solution.² Close the flask, and keep it in the dark for 1 h while shaking frequently. Perform the test in *Fats and Fixed Oils* (401), *Iodine Value*, starting with "Then add, in the order named, 30 mL of potassium iodide TS and 100 mL of water."

Acceptance criteria

Polyglyceryl 3 dioleate: 60–80

Polyglyceryl 6 dioleate: 50–70

- **FATS AND FIXED OILS**, *Peroxide Value* (401): Use 30 mL of a mixture of glacial acetic acid and methylene chloride (3:2) to replace 30 mL of a mixture of glacial acetic acid and chloroform (3:2).

Acceptance criteria

Polyglyceryl 3 dioleate: NMT 12.5

Polyglyceryl 6 dioleate: NMT 12.5

- **FATS AND FIXED OILS**, *Saponification Value* (401):

Determined on 1-g specimen

Acceptance criteria

Polyglyceryl 3 dioleate: 135–155

Polyglyceryl 6 dioleate: 110–140

- **WATER**, *Method I* (921): NMT 1%, determined on a 2.0-g specimen

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, protected from heat and moisture.

- **LABELING:** Label to indicate whether it is Polyglyceryl 3 Dioleate or Polyglyceryl 6 Dioleate.

- **USP REFERENCE STANDARDS** (11)

Polyglyceryl 3 Diisostearate

R = H, or CO-C₁₇H₃₅-iso

1,2,3-Propanetriol, homopolymer, diisooctadecanoate; Triglyceryl diisostearate [63705-03-3].

DEFINITION

Polyglyceryl 3 Diisostearate is a mixture of polyglyceryl diesters of mainly isostearic acid, obtained by esterification of polyglycerin and isostearic acid. The polyglycerin consists mainly of triglycerin.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F)

- **B.** It meets the requirements of the test for *Content of Fatty Acids*.

ASSAY

- **CONTENT OF FATTY ACIDS**

0.5 N methanolic sodium hydroxide solution: Dissolve 20 g of sodium hydroxide in 50 mL of water, and mix. Cool to room temperature, and add 950 mL of methanol.

Boron trifluoride-methanol solution: Dissolve 14 g of boron trifluoride in methanol to make 100 mL, and mix well.¹

Saturated sodium chloride solution: Dissolve about 375 g of sodium chloride in water to make 1000 mL.

Standard solution: Prepare the calibration ester mixture by mixing up each individual ester component (see Table 1). Dissolve 500 mg of the calibration ester mixture in *n*-heptane, and dilute with *n*-heptane to 50 mL.

Table 1

Component in the Calibration Ester Mixture	Composition (%) ^a
USP Methyl Myristate RS (C14:0)	7
USP Methyl Palmitate RS (C16:0)	70
USP Methyl Stearate RS (C18:0)	23

^a Composition is proposed according to the relative composition of these three fatty acid groups in Polyglyceryl 3 Diisostearate.

Sample solution: Introduce 100 mg of Polyglyceryl 3 Diisostearate into a 25-mL conical flask, fitted with a suitable water-cooled reflux condenser and a magnetic stir bar. Add 2 mL of 0.5 N methanolic sodium hydroxide solution, mix, and reflux for about 30 min. Add 2 mL of Boron trifluoride-methanol solution through the condenser, and reflux for about 30 min. Add 4 mL of *n*-heptane through the condenser, and reflux for 5 min. Cool, remove the condenser, add about 10 mL of Saturated sodium chloride solution, shake, add a quantity of Saturated sodium chloride solution to bring the upper layer up to the neck of the flask, and allow the layers to separate. Collect 2 mL of *n*-heptane layer (upper layer), wash with three quantities, each of 2 mL of water, and dry the *n*-heptane phase over anhydrous sodium sulfate.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica capillary column, 0.25-μm layer of phase G16

¹ Boron trifluoride-methanol solution (14% in methanol) is also commercially available from Sigma, B-1252, or equivalent quality.

² Wijs' reagent RPE for analysis from Carlo Erba Reference 491902; Wijs' solution from www.sigmaaldrich.com, or equivalent quality.

Temperature

Detector: 250°

Injection port: 240°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	6	250	6

Carrier gas: Nitrogen

Flow rate: 1.0–1.2 mL/min

Injection size: 1 µL

Injection type: Split injection. Split ratio is about 1:80.

System suitability

Sample: *Standard solution*

[NOTE—See the relative retention time table below.]

Name	Relative Retention Time
Methyl myristate	1.0
Methyl palmitate	1.4
Methyl stearate	1.8

Suitability requirements

Resolution: NLT 10 between the peaks due to methyl palmitate and methyl stearate

Relative standard deviation: NMT 6.0% for the peak responses for palmitate and stearate

AnalysisSamples: *Standard solution* and *Sample solution*

Identify the fatty acid ester peaks in the chromatogram of the *Sample solution* by comparing the retention times of these peaks with those obtained in the chromatogram of the *Standard solution*, and measure the peak areas for all of the fatty acid ester peaks in the chromatogram obtained from the *Sample solution*.

Calculate the percentage of each fatty acid ester component in the test specimen:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for each individual fatty acid ester component

r_T = sum of the peak responses, excluding the solvent peak, in the chromatogram obtained from the *Sample solution*

Acceptance criteria

Sum of the contents of the fatty acids eluting between palmitic acid and stearic acid (excluding palmitic acid and stearic acid): NLT 60.0%

Sum of the contents of myristic acid, palmitic acid, and stearic acid: NMT 11.0%

IMPURITIES**Inorganic Impurities****• RESIDUE ON IGNITION**

Analysis: Heat a silica crucible to redness for 30 min, allow to cool in a desiccator, and weigh. Evenly distribute about 1.0 g of Polyglyceryl 3 Diisostearate in the crucible and weigh. Dry at 100°–105° for 1 h, and ignite in a muffle furnace at 600 ± 25°, until the test substance is thoroughly charred. Perform the test for *Residue on Ignition* (281) on the residue obtained, starting with "Moisten the sample with a small amount (usually 1 mL) of sulfuric acid".

Acceptance criteria: NMT 0.5%

• Heavy Metals, Method II (231): NMT 10 ppm**SPECIFIC TESTS****• ACID VALUE**

Analysis: Accurately weigh (to within 0.1 mg) 5–10 g of Polyglyceryl 3 Diisostearate, add 10 mL of alcohol and 3 drops of phenolphthalein TS, and titrate with 0.1 N potassium hydroxide VS or 0.1 N sodium hydroxide VS until the solution remains faintly pink after shaking for 30 s. Follow the procedures for *Fats and Fixed Oils, Acid Value* (401) to perform the calculation.

Acceptance criteria: NMT 3.0

• FATS AND FIXED OILS, Hydroxyl Value (401): 180–230, determined on a 0.25-g specimen**• IODINE VALUE**

Analysis: Accurately weigh 3 g of Polyglyceryl 3 Diisostearate, transfer to a dry 250-mL flask with a ground-glass stopper, and add 25 mL of methylene chloride. Add 20 mL of the Wijs' solution.² Close the flask, and keep it in the dark for 1 h while shaking frequently. Perform the test in *Fats and Fixed Oils (401) Iodine Value*, starting with "Then add, in the order named, 30 mL of potassium iodide TS and 100 mL of water".

Acceptance criteria: NMT 3.0

• FATS AND FIXED OILS, Peroxide Value (401): NMT 6.0. Use 30 mL of a mixture of glacial acetic acid and methylene chloride (3:2) to replace the 30 mL of a mixture of glacial acetic acid and chloroform (3:2).**• FATS AND FIXED OILS, Saponification Value (401):** 128–160**• WATER DETERMINATION, Method I (921):** NMT 0.5%, determined on a 2.0-g specimen**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, protected from heat and moisture.**• USP REFERENCE STANDARDS (11)**

USP Polyglyceryl 3 Diisostearate RS

Polyisobutylene

[9003-27-4].

DEFINITION

Polyisobutylene is a synthetic polymer produced by the low-temperature polymerization of isobutylene in liquid ethylene, methylene chloride, or hexane, using an aluminum-chloride or boron-trifluoride catalyst. It may contain a suitable stabilizer.

IDENTIFICATION**• A. INFRARED ABSORPTION (197F)**

Analysis: Prepare the sample by dissolving it in hot toluene and evaporating on a salt plate.

Acceptance criteria: Meets the requirements

IMPURITIES**• LEAD (251)**

Sample: 3.3 g

Control: 10 mL of *Diluted Standard Lead Solution* (10 µg of lead)

Analysis: Transfer the *Sample* to a porcelain dish, and heat on a hot plate until completely charred. Then heat in a muffle furnace at 480° for 8 h, and cool. Cautiously add 5 mL of nitric acid, evaporate to dryness on a hot

² Wijs' reagent RPE for analysis from Carlo Erba Reference 491902, Wijs' solution from www.sigmaaldrich.com, or equivalent quality.

plate, then heat again in the muffle furnace for exactly 15 min, and cool. Extract the ash with two 10-mL portions of water, filtering the extract into a separator. Leach any insoluble material on the filter with 6 mL of *Ammonium Citrate Solution*, 2 mL of *Hydroxylamine Hydrochloride Solution*, and 5 mL of water, adding the filtered washings to the separator. To the resulting solution and *Control* continue as directed in the chapter for *Procedure*, beginning with "Add 2 drops of phenol red TS".

Acceptance criteria: NMT 3 mg/g; the color generated by the *Sample* does not exceed that generated by the *Control*.

SPECIFIC TESTS

• VISCOSITY—CAPILLARY VISCOMETER METHODS (911)

Solvent: Use isooctane.

Sample solution: Prepare a solution of Polyisobutylene in the *Solvent* having a known concentration as indicated in *Table 1*. The solution must be homogenous before testing. For the Polyisobutylene having a Staudinger Index of 100 and higher, add the *Solvent* to the weighed material, and allow it to stand in an oven at 80° for 12–24 h. [NOTE—A heated mechanical shaker may be used to shorten the dissolution time; it is recommended that a gentle shaker be used to avoid shearing the polymers. Take adequate precautions to prevent evaporation of the *Solvent*.]

Table 1

Staudinger Index ^a	Concentration (g/cm ³)
25–60	0.01
60–100	0.005
100–350	0.002
350–700	0.001

^a The Staudinger Index is equal to 100 times the intrinsic viscosity.

Analysis: Before each measurement, let the solutions be temperature equilibrated for 10 min. Using a suitable Ubbelohde capillary viscometer having dimensions such that the flow time is NLT 200 s, immersed in a controlled temperature bath, measure the flow of the *Solvent* and of the *Sample solution* at 20°. Repeat the *Analysis* three times, and calculate the average. Calculate the reduced viscosity:

$$\eta = (t/t_0 - 1)/C$$

t = average flow time of the *Sample solution* (s)

t_0 = average flow time of the *Solvent* (s)

C = concentration of the *Sample solution* (g/cm³)

Calculate the Staudinger Index:

$$I_0 = \eta/[1 + 0.31(t/t_0 - 1)]$$

Acceptance criteria: It is within the limits specified on the label.

• LOSS ON DRYING (731)

Sample: 5 g

Analysis: Dry for 2 h at 105°.

Acceptance criteria: NMT 0.3%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.
- **LABELING:** Label it to indicate the range for intrinsic viscosity or the range for the Staudinger Index, and the name and quantity of any added stabilizer. [NOTE—The Staudinger Index is equal to 100 times the intrinsic viscosity.]

• USP REFERENCE STANDARDS (11)

USP Polyisobutylene RS

Polyoxyl 10 Oleyl Ether

Polyoxy-1,2-ethanediyl, α -(Z)-9-octadecenyl- ω -hydroxy-; Polyethylene glycol monooleyl ether [9004-98-2].

DEFINITION

Polyoxyl 10 Oleyl Ether is a mixture of the mono-oleyl ethers of mixed polyoxyethylene diols, the average polymer length being equivalent to NLT 9.1 and NMT 10.9 oxyethylene units. It may contain suitable stabilizers.

IDENTIFICATION

• A. INFRARED ABSORPTION (197F)

Sample: Use undried specimen.

Acceptance criteria: Meets the requirements

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 25 g

Analysis: Weigh the *Sample* into a tared 40-mL porcelain crucible, and heat in contact with air until it ignites spontaneously or can be ignited with a glowing splint. Allow the flame to go out, and place the crucible in a muffle furnace with the door partly open until the carbon is consumed. Close the door, and heat at 700 \pm 100° for 1 h. Cool in a desiccator, weigh, and calculate the percentage of residue. If it exceeds 0.4%, again heat until constant weight is attained.

Acceptance criteria: NMT 0.4%

• HEAVY METALS, *Method II* (231): NMT 20 μ g/g

• FREE POLYETHYLENE GLYCOLS

Sample solution: Transfer 12 g to a 500-mL separator containing 50 mL of ethyl acetate. Add 50 mL of sodium chloride solution (0.29 g/mL), shake vigorously for 2 min, and allow to separate for 15 min. Drain the lower, aqueous phase into a second 500-mL separator, and extract the upper layer with a second 50-mL portion of sodium chloride solution (0.29 g/mL). To the combined aqueous layers add 50 mL of ethyl acetate, shake vigorously for 2 min, and allow to separate as before. Drain the lower, aqueous phase into a third 500-mL separator, and extract with two 50-mL portions of chloroform by shaking for 2 min each time.

Analysis: Evaporate the combined chloroform extracts in a 150-mL beaker on a steam bath, with the aid of a stream of nitrogen, to apparent dryness. Redissolve in 15 mL of chloroform, and transfer to a filter, collecting the filtrate in a 150-mL beaker. Rinse the funnel with several small portions of chloroform, and evaporate the combined filtrate and rinsings, as described above, until no odor of chloroform or ethyl acetate is perceptible. Cool in a desiccator, and weigh.

Acceptance criteria: NMT 7.5%

• FREE ETHYLENE OXIDE

Internal standard solution: 100 mg/mL of *n*-butyl chloride in chlorobenzene. Store in a tightly closed container. Prepare fresh weekly.

Standard stock solution

[**CAUTION**—Ethylene oxide is toxic and flammable. Prepare this solution in a well-ventilated hood, using great care.]

Place 250 mL of chlorobenzene in a glass-stoppered 500-mL conical flask. Bubble ethylene oxide through the chlorobenzene at a moderate rate for 30 min, insert the stopper, and store with protection from heat. Pipet 25 mL of 0.5 N alcoholic hydrochloric acid solution, prepared by mixing 45 mL of hydrochloric acid with 1 L of alcohol, into a 500-mL conical flask containing 40 g of magnesium chloride hexahydrate. Shake the mixture

to effect saturation. Pipet 10 mL of the ethylene oxide solution into the flask, and add 20 drops of bromocresol green TS. If the solution is not yellow (acid) at this point, add an additional volume of 0.5 N alcoholic hydrochloric acid to give an excess of 10 mL. Record the total volume of 0.5 N alcoholic hydrochloric acid added. Insert the stopper in the flask, and allow to stand for 30 min. Titrate the excess acid with 0.5 N alcoholic potassium hydroxide VS. Perform a blank titration, using 10.0 mL of chlorobenzene instead of ethylene oxide solution, adding the same total volume of 0.5 N alcoholic hydrochloric acid, and note the difference in volumes required. Each mL of the difference in volumes of 0.5 N alcoholic potassium hydroxide consumed is equivalent to 22.02 mg of ethylene oxide. Calculate the concentration, in mg/mL, of ethylene oxide in the *Standard stock solution*. Standardize daily.

Standard solution: Transfer 5 g of Polyoxyl 10 Oleyl Ether to a suitable glass bottle of 60-mL capacity, and add 10 mL of chlorobenzene, exactly 50 μ L of *Internal standard solution*, and a volume of *Standard stock solution* containing 0.5 mg of ethylene oxide. Insert a magnetic stirring bar, cap the bottle tightly, and stir until homogeneity is attained.

Sample solution: Transfer 5 g of Polyoxyl 10 Oleyl Ether to a suitable glass bottle of 60-mL capacity, and add 10 mL of chlorobenzene and 50 μ L of *Internal standard solution*. Add a volume of chlorobenzene equal to the volume of the *Standard stock solution* added to prepare the *Standard solution*. Insert a magnetic stirring bar, cap the bottle tightly, and stir until homogeneity is attained.

Interference check solution: Transfer 5 g of Polyoxyl 10 Oleyl Ether to a suitable glass bottle of 60-mL capacity, and add 10 mL of chlorobenzene. Add a volume of chlorobenzene equal to the volume of the *Standard stock solution* used to prepare the *Standard solution*. Insert a magnetic stirring bar, cap the bottle tightly, and stir until homogeneity is attained.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 3-mm (OD) \times 1.8-m stainless steel packed with S3

Temperatures

Injection port: 210°

Detector: 230°

Column: 160°

Carrier gas: Helium

Flow rate: 66 mL/min

Injection volume: 2 μ L

System suitability

Samples: Chlorobenzene, *Internal standard solution*, *Standard stock solution*, and *Interference check solution*

Interference check: Inject a suitable volume of chlorobenzene into the gas chromatograph, and allow the chromatogram to run until the solvent has eluted.

Similarly inject and chromatograph the *Internal standard solution*, the *Standard stock solution*, and the *Interference check solution*. No interfering peaks are observed.

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the weight of ethylene oxide in the portion of sample taken:

$$W_T = (W_E \times W_U \times R_U) / [(W_U \times R_S) - (W_S \times R_U)] \times F$$

W_E = weight of ethylene oxide added to the *Standard solution* (mg)

W_U = weight of Polyoxyl 10 Oleyl Ether used to prepare the *Sample solution* (g)

R_U = peak area ratio of ethylene oxide to the internal standard for the *Sample solution*

R_S = peak area ratio of ethylene oxide to the internal standard for the *Standard solution*
 W_S = weight of Polyoxyl 10 Oleyl Ether used to prepare the *Standard solution* (g)

F = unit conversion, mg to g (10^{-3})

Calculate the percentage of ethylene oxide in the portion of Polyoxyl 10 Oleyl Ether taken:

$$\text{Result} = (W_T / W_U) \times 100$$

W_T and W_U are as defined above.

Acceptance criteria: NMT 0.01%

SPECIFIC TESTS

• **WATER DETERMINATION, Method I** <921>: NMT 3.0%

• **FATS AND FIXED OILS, Acid Value** <401>: NMT 1.0.

• **FATS AND FIXED OILS, Hydroxyl Value** <401>: 75–95

• **FATS AND FIXED OILS, Iodine Value, Method I** <401>

Sample: 550 mg

Analysis: Proceed as directed in the chapter, with the reaction time being extended to 60 min.

Acceptance criteria: 23–40

• **FATS AND FIXED OILS, Saponification Value** <401>: NMT 3

• **AVERAGE POLYMER LENGTH**

Sample solution: If solid material is present, place the Polyoxyl 10 Oleyl Ether in a 60° water bath overnight. Shake vigorously to eliminate any possibility of molecular weight gradients within it. Add 1 mL of the melt to 1 mL of deuterated chloroform in a test tube, and shake the test tube until dissolution is complete. Transfer 0.5 mL to an NMR tube, and add a small amount of tetramethylsilane as an internal reference standard. Cap the tube tightly, and shake thoroughly.

Analysis: Place the tube in an NMR spectrometer that is capable of performing quantitative analysis, and record the NMR spectrum (see *Nuclear Magnetic Resonance* <761>, *Quantitative Applications*). Integrate the areas from 0.4 to 2.35 ppm (A_1), and from 2.35 to 4.9 ppm (A_2).

Calculate the number of oxyethylene units per molecule taken:

$$\text{Result} = [(31A_2 / A_1) - 3] / 4$$

31 = total number of protons in the molecule not activated by either oxygen or a double bond

3 = number of oxygen-activated protons not included in the oxyethylene unit count

4 = number of protons in each oxyethylene unit

Acceptance criteria: 9.1–10.9

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store in a cool place.

• **LABELING:** Label to indicate the names and proportions of any added stabilizers.

• **USP REFERENCE STANDARDS** <11>

USP Polyoxyl 10 Oleyl Ether RS

Polyoxyl 15 Hydroxystearate

12-Hydroxyoctadecanoic acid polymer with α -hydro- ω -hydroxypoly(oxy-1,2-ethanediyl);
Polyethylene glycol 15 hydroxystearate [70142-34-6].

DEFINITION

Polyoxyl 15 Hydroxystearate results from the reaction of about 15 moles of ethylene oxide with 1 mole of 12-hydroxystearic acid. The product consists mainly of 12-hydroxystearic acid polyethoxylated at both the carboxyl and the hydroxyl groups with polyethylene glycol. It contains free polyethylene glycols.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197F): If the sample is solid or too viscous for thin film formation, the sample should be gently warmed to achieve a mobile liquid, which may then be used to prepare the thin film.

- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

Sample solution: To 1.0 g of Polyoxyl 15 Hydroxystearate add 100 mL of a 100-mg/mL solution of potassium hydroxide, and boil under a reflux condenser for 30 min. Acidify the warm solution with 20 mL of hydrochloric acid, and cool to room temperature. Shake the mixture with 50 mL of ether, and allow to stand until a separation of the layers is visible. Separate the clear upper layer, add 5 g of anhydrous sodium sulfate, wait for 30 min, filter, and evaporate to dryness on a water bath. Dissolve 50 mg of the residue in 25 mL of ether.

Standard solution: 2 mg/mL of USP 12-Hydroxystearic Acid RS in methylene chloride

Plate: Octadecylsilyl silica gel for chromatography as the coating substance

Application volume: 2 μ L

Developing solvent system: Acetone, methylene chloride, and glacial acetic acid (50:10:40)

Spray reagent: Prepare a solution of 80 mg/mL of phosphomolybdic acid in 2-propanol.

Analysis: Proceed as directed in the chapter. Develop over two-thirds of the plate, and dry in a current of cold air. Then spray the plate with *Spray reagent*, heat the plate at 120° for 1–2 min, and locate the spots on the plate.

Acceptance criteria: The R_f value and color of the principal spot of the *Sample solution* correspond to those of the *Standard solution*.

- **C.** It meets the requirements of the test for *Free Polyethylene Glycols*.

COMPOSITION

- **FREE POLYETHYLENE GLYCOLS**

Mobile phase: Methanol and water (8:2)

Standard solution A: 1.6 mg/mL of USP Polyethylene Glycol 1000 RS in *Mobile phase*

Standard solution B: 0.8 mg/mL of USP Polyethylene Glycol 1000 RS in *Mobile phase*, diluted from *Standard solution A* in *Mobile phase*

Sample solution: 4.8 mg/mL of Polyoxyl 15 Hydroxystearate in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Columns: 7.8-mm \times 30-cm analytical column; 6- μ m packing L39 and a 12-nm pore size; two 4-mm \times 12.5-cm precolumns; 5- μ m packing L1 and a 10-nm pore size.

Connect both precolumns to the analytical column using a 3-way valve, and switch the *Mobile phase* flow according to the following program. [NOTE—Shown in *Figure 1*, the analysis is started with precolumn 2 and an analytical column in series. After about 114 s, the valves, controlled by the detector program, switch over such that the eluent flows past precolumn 2, and direct to precolumn 1 and the analytical column. The columns are switched when the components to be determined, but not the interfering matrix, are ready to reach the analytical column. Simultaneously, precolumn 2 is washed out in the reverse direction by a second pump to remove the unwanted matrix components.]

Time (s)	Program
0–114	Precolumn 2 and analytical column
115–end	Precolumn 1 and analytical column
115–420	Reverse flow of precolumn 2

Temperature

Column: Room temperature

Detector: Room temperature

Flow rate: 1.1 mL/min

Injection size: 50 μ L

System suitability

Sample: *Standard solution A*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of polyethylene glycols in the portion of Polyoxyl 15 Hydroxystearate taken:

$$\text{Result} = 2 \times (C_S/C_U)[r_U/(r_{S1} + 2r_{S2})] \times 100$$

C_S = concentration of USP Polyethylene Glycol 1000 RS in *Standard solution A* (mg/mL)

C_U = concentration of Polyoxyl 15 Hydroxystearate in the *Sample solution* (mg/mL)

r_U = peak response of polyethylene glycol from the *Sample solution*

r_{S1} = peak response of polyethylene glycol 1000 from *Standard solution A*

r_{S2} = peak response of polyethylene glycol 1000 from *Standard solution B*

Acceptance criteria: 27.0%–39.0% of free polyethylene glycols

IMPURITIES**Inorganic Impurities**

- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 0.3%, determined on 1.0 g

- **LIMIT OF NICKEL**

[**CAUTION**—When using closed high-pressure digestion vessels and microwave laboratory equipment, the safety precautions and operating instructions given by the manufacturer must be followed.]

[NOTE—If an alternative apparatus is used, adjustment of the instrument parameters may be necessary.]

Nickel standard stock solution: Dilute nickel standard solution TS two-fold with water. This solution contains the equivalent of 5 μ g/mL of nickel.

Standard solutions: Transfer 25, 50, 75, and 100 μ L of *Nickel standard stock solution* to four identical 25-mL volumetric flasks. To each flask add 0.5 mL of a 10-mg/mL solution of magnesium nitrate, 0.5 mL of a 100-mg/mL solution of monobasic ammonium phosphate, and 6.0 mL of nickel-free nitric acid, dilute with water to volume, and mix well. [NOTE—Content of nickel in the nickel-free nitric acid is NMT 0.005 ppm.] The *Standard solutions* contain 0.005, 0.01, 0.015, and 0.02 μ g/mL of nickel, respectively.

Sample solution: Transfer about 250 mg of Polyoxyl 15 Hydroxystearate to a suitable high-pressure-resistant digestion vessel (fluoropolymer or quartz glass), and add 6.0 mL of nickel-free nitric acid and 2.0 mL of 30% hydrogen peroxide. Place the closed vessel in a laboratory microwave oven, and digest using an appropriate program, e.g., 1000 W for 40 min. Allow the digestion vessel to cool down before opening. Add 2.0 mL of 30% hydrogen peroxide, and repeat the digestion step. Allow the digestion vessel to cool down before opening. Quantitatively transfer to a 25-mL volumetric flask, add 0.5 mL of a 10-mg/mL solution of magnesium nitrate and 0.5 mL of a 100-mg/mL

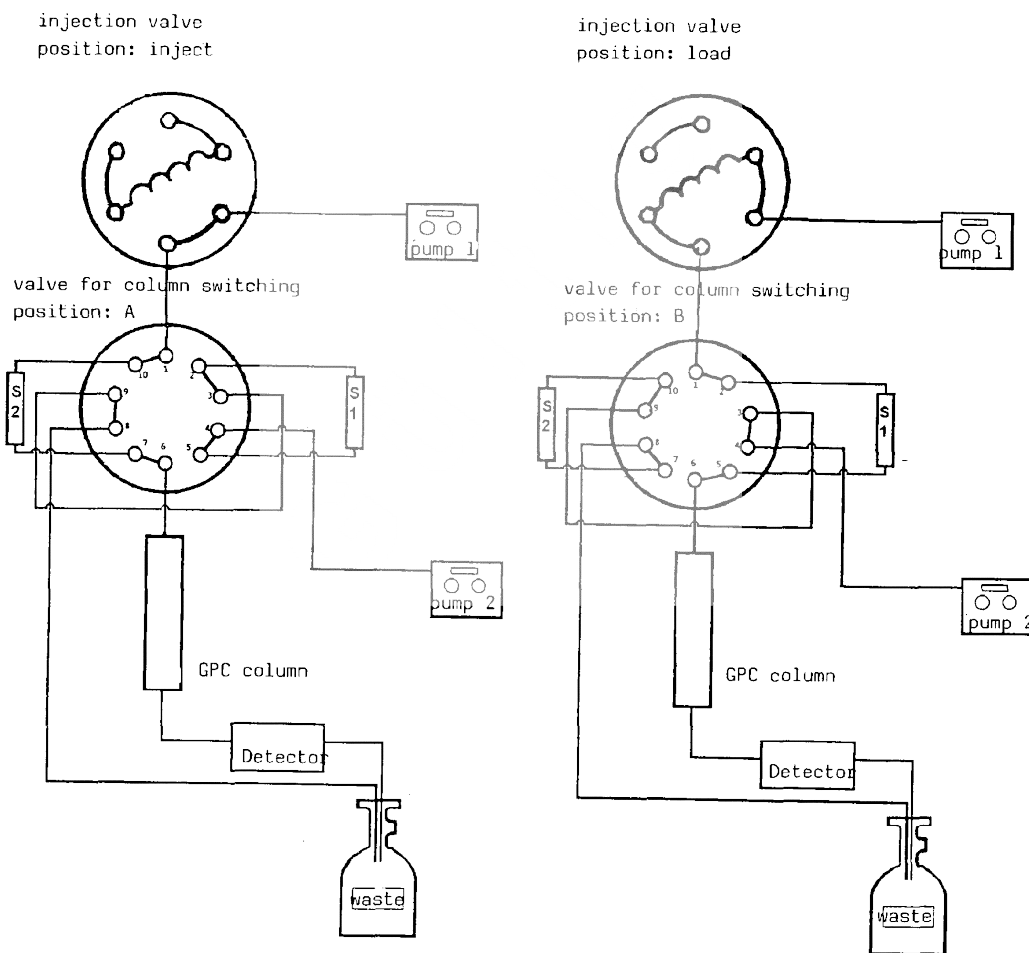

Figure 1. Apparatus

solution of monobasic ammonium phosphate, dilute with water to volume, and mix well.

Blank solution: Place 6.0 mL of nickel-free nitric acid and 2.0 mL of 30% hydrogen peroxide in a suitable high-pressure-resistant digestion vessel. Proceed as directed under *Sample solution*, beginning with "Place the closed vessel in a laboratory microwave oven, and digest using an appropriate program, e.g., 1000 W for 40 min."

Zero solution: In a 50-mL volumetric flask, introduce 1.0 mL of a 10-mg/mL solution of magnesium nitrate, 1.0 mL of a 100-mg/mL solution of monobasic ammonium phosphate, and 12.0 mL of nickel-free nitric acid. Dilute with water to volume, and mix well.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Graphite furnace atomic absorption spectrophotometer equipped with a background compensation system, a coated tube resistant to pyrolysis, and a nickel hollow-cathode lamp.

Analytical wavelength: Nickel emission line of 232.0 nm

Temperature: Maintain the drying temperature of the furnace at 120° for 35 s after a 5-s ramp; maintain the ashing temperature at 1100° for 10 s after a 30-s ramp; maintain the cooling temperature at 800° for 5 s after a 5-s decrease; and maintain the atomization temperature at 2600° for 7 s. [NOTE—The temperature program may be modified to obtain optimum furnace temperatures.]

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank solution*

Concomitantly determine the absorbances of the *Samples* using the *Spectrometric conditions* described above. Use the *Zero solution* to set the instrument to zero. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of nickel, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, C_T , in µg/mL, of nickel in the *Sample solution*, and determine the concentration, C_B , in µg/mL, of nickel in the *Blank solution*. If necessary, dilute with the *Zero solution* to obtain a reading within the calibrated absorbance range.

Calculate the quantity, in µg, of nickel in each g of Polyoxyl 15 Hydroxystearate taken:

$$\text{Result} = V \times (C_T - C_B)/W$$

V = volume of the *Sample solution* and the *Blank solution*, 25 mL

W = weight of Polyoxyl 15 Hydroxystearate taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 1 µg/g of nickel

Organic Impurities

• PROCEDURE: LIMIT OF FREE ETHYLENE OXIDE AND DIOXANE

[CAUTION—Ethylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated fume hood, using great care. Protect both hands and face by wearing

polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between 4° and 8°.] [NOTE—Before using the polyethylene glycol 200 in this test, remove any volatile components from it by placing 500 mL of polyethylene glycol 200 in a 1000-mL round-bottom flask, attaching the flask to a rotary evaporator maintained at a temperature of 60° and under a vacuum of 10–20 mm Hg for 6 h.]

Acetaldehyde solution: 10 µg/mL of acetaldehyde. [NOTE—Prepare the *Acetaldehyde solution* immediately prior to use.]

Ethylene oxide stock solution: Fill a chilled pressure bottle with liquid ethylene oxide, and store in a freezer when not in use. Use a small piece of polyethylene film to protect the liquid from contact with the rubber gasket. Tare a glass-stoppered conical flask, add about 50 mL of polyethylene glycol 200, and reweigh the flask. Transfer about 5 mL of the liquid ethylene oxide to a 100-mL beaker chilled in a mixture of sodium chloride and ice (1:3). Using a gas-tight syringe that has been previously cooled to –10°, transfer about 300 µL (corresponding to about 250 mg) of liquid ethylene oxide to the polyethylene glycol 200, and swirl gently to mix. Replace the stopper, reweigh the flask, and determine the amount of ethylene oxide absorbed by weight difference. Adjust the weight of the mixture with polyethylene glycol 200 to 100.0 g, replace the stopper, and swirl gently to mix. This stock solution contains about 2.5 mg/g of ethylene oxide. [NOTE—Prepare this stock solution immediately prior to use, and store in a refrigerator.]

Ethylene oxide solution: Tare a glass-stoppered conical flask, and chill it in a refrigerator. Add about 35 mL of polyethylene glycol 200, and reweigh the flask. Using a gas-tight gas chromatographic syringe that has been chilled in a refrigerator, transfer about 1 g of the chilled *Ethylene oxide stock solution*, weighed, to the tared, conical flask. Adjust the weight of the solution with polyethylene glycol 200 to 50.0 g, replace the stopper, and swirl gently to mix. Transfer about 10 g of this solution, weighed, to a 50-mL volumetric flask. Add 30 mL of water, and mix. Dilute with water to volume, and mix to obtain a solution containing about 10 µg/mL of ethylene oxide. [NOTE—Prepare this solution immediately prior to use, and use directly after preparation.]

Dioxane solution: 500 µg/mL of dioxane

Standard solution A: Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL pressure headspace vial. [NOTE—Other sizes may be used depending on the operating conditions, however, the same size must be used for *Standard solution A*, *Standard solution B*, and the *Sample solution*.] Add 0.1 mL of *Acetaldehyde solution* and 0.1 mL of *Dioxane solution*, seal the vial, and mix.

Standard solution B: Transfer about 1.0 g of Polyoxyl 15 Hydroxystearate to another 10-mL pressure headspace vial, add 0.1 mL of *Ethylene oxide solution*, 0.1 mL of *Dioxane solution*, and 1.0 mL of *N,N*-dimethylacetamide. Seal the vial, and mix.

Sample solution: Transfer about 1.0 g of Polyoxyl 15 Hydroxystearate to a 10-mL pressure headspace vial, add 1.0 mL of *N,N*-dimethylacetamide and 0.2 mL of water, seal the vial, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[NOTE—The use of a headspace apparatus that automatically transfers a measured amount of headspace is allowed.]

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m glass or quartz capillary; 1.0-µm layer of phase G1

Temperature

Injector port: 150°

Detector: 250°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	—	50	5
50	5	180	—
180	30	230	—
230	—	230	5

Carrier gas: Helium

Linear velocity: 20 cm/s

Injection size: 1 mL (the gaseous headspace)

Injection type: Split ratio 20:1

[NOTE—If the headspace apparatus is used, then an injection time of 12 s and a transfer line temperature of 150° are recommended.]

Headspace sampler: Each vial is heated at a temperature of 90° for 45 min, before a suitable portion of its headspace is injected.

System suitability

Sample: *Standard solution A*

[NOTE—The relative retention times for acetaldehyde and ethylene oxide are 0.94 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between acetaldehyde and ethylene oxide

Signal-to-noise ratio: NLT 5, determined from the dioxane peak

Relative standard deviation: NMT 15%

Analysis

Samples: *Standard solution B* and *Sample solution*

Using a heated, gas-tight, gas chromatographic syringe, separately inject equal volumes of the gaseous headspace of the *Samples* into the chromatograph, record the chromatograms, and measure the areas for the major peaks: the mean areas of the ethylene oxide and dioxane peaks from the *Sample solution* are not greater than half the mean areas of the corresponding peaks from *Standard solution B*.

Calculate the content of ethylene oxide, in ppm, in the portion of Polyoxyl 15 Hydroxystearate taken:

$$\text{Result} = (A_E \times r_U) / [(r_S \times W_U) - (r_U \times W_S)]$$

A_E = quantity of ethylene oxide added to *Standard solution B* (µg)

r_U = ethylene oxide peak response from the *Sample solution*

r_S = ethylene oxide peak response from *Standard solution B*

W_U = weight of test substance taken to prepare the *Sample solution* (g)

W_S = weight of test substance taken to prepare *Standard solution B* (g)

Calculate the content of dioxane, in ppm, in the portion of Polyoxyl 15 Hydroxystearate taken:

$$\text{Result} = (A_D \times r_U) / [(r_S \times W_U) - (r_U \times W_S)]$$

A_D = quantity of dioxane added to *Standard solution B* (µg)

r_U = dioxane peak response from the *Sample solution*

r_S = dioxane peak response from *Standard solution B*

W_U = weight of test substance taken to prepare the *Sample solution* (g)

W_S = weight of test substance taken to prepare *Standard solution B* (g)

Acceptance criteria

Ethylene oxide: NMT 1 ppm

Dioxane: NMT 50 ppm

Polyoxyl 20 Cetostearyl Ether

DEFINITION

Polyoxyl 20 Cetostearyl Ether is a mixture of mono-cetostearyl (mixed hexadecyl and octadecyl) ethers of mixed polyoxyethylene diols, the average polymer length being equivalent to NLT 17.2 and NMT 25.0 oxyethylene units.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>: Use undried specimen.

IMPURITIES

- **RESIDUE ON IGNITION** <281>

Sample: 25 g

Analysis: Weigh the *Sample* into a tared 40-mL porcelain crucible, and heat in contact with air until it ignites spontaneously or can be ignited with a glowing splint. Allow the flame to go out, place the crucible in a muffle furnace with the door partly open until the carbon is consumed, close the door, and heat at $700 \pm 100^\circ$ for 1 h. Cool in a desiccator, weigh, and calculate the percentage of residue. If the amount so obtained exceeds 0.4%, heat again until constant weight is attained.

Acceptance criteria: NMT 0.4%

- **HEAVY METALS**, *Method II* <231>: NMT 20 µg/g
- **FREE POLYETHYLENE GLYCOLS**

Sample solution: Transfer 12 g to a 500-mL separator containing 50 mL of ethyl acetate. Add 50 mL of sodium chloride solution (0.29 g/mL), shake vigorously for 2 min, and allow to separate for 15 min. Drain the lower, aqueous phase into a second 500-mL separator, and extract the upper layer with a second 50-mL portion of sodium chloride solution (0.29 g/mL). To the combined aqueous layers, add 50 mL of ethyl acetate, shake vigorously for 2 min, and allow to separate as before. Drain the lower, aqueous phase into a third 500-mL separator, and extract with two 50-mL portions of chloroform by shaking for 2 min each time.

Analysis: Evaporate the combined chloroform extracts in a 150-mL beaker on a steam bath, with the aid of a stream of nitrogen, to apparent dryness. Redissolve in 15 mL of chloroform, and transfer to a filter, collecting the filtrate in a 150-mL beaker. Rinse the funnel with several small portions of chloroform, and evaporate the combined filtrate and rinsings, as described above, until no odor of chloroform or ethyl acetate is perceptible. Cool in a desiccator, and weigh.

Acceptance criteria: NMT 7.5%

• **FREE ETHYLENE OXIDE**

Internal standard solution: 100 mg/mL of *n*-butyl chloride in chlorobenzene. Store in a tightly closed container. Prepare fresh weekly.

Standard stock solution

[**CAUTION**—Ethylene oxide is toxic and flammable. Prepare this solution in a well-ventilated hood, using great care.]

Place 250 mL of chlorobenzene in a glass-stoppered, 500-mL conical flask. Bubble ethylene oxide through the chlorobenzene at a moderate rate for 30 min, insert the stopper, and store with protection from heat. Pipet 25 mL of a 0.5 N alcoholic hydrochloric acid solution, prepared by mixing 45 mL of hydrochloric acid with 1 L of alcohol, into a 500-mL conical flask containing 40 g of magnesium chloride hexahydrate. Shake the mixture to effect saturation. Pipet 10 mL of the ethylene oxide solution into the flask, and add 20 drops of bromocresol green TS. If the solution is not yellow (acid) at this point, add an additional volume of 0.5 N alcoholic hydrochloric acid to give an excess of 10 mL. Record the total volume of 0.5 N alcoholic hydrochloric acid added. Insert the stopper in the flask, and allow to stand for 30 min. Titrate the excess acid with 0.5 N alcoholic potassium hydroxide VS.

Perform a blank titration, using 10.0 mL of chlorobenzene instead of ethylene oxide solution, adding the same total volume of 0.5 N alcoholic hydrochloric acid, and note the difference in volumes required. Each mL of the difference in volumes of 0.5 N alcoholic potassium hydroxide consumed is equivalent to 22.02 mg of ethylene oxide. Calculate the concentration, in mg/mL, of ethylene oxide in the *Standard stock solution*. Standardize daily.

Standard solution: Transfer 5 g of Polyoxyl 20 Cetostearyl Ether to a suitable glass bottle of 60-mL capacity. Add 10 mL of chlorobenzene, exactly 50 µL of *Internal standard solution*, and a volume of *Standard stock solution* containing 0.5 mg of ethylene oxide. Insert a magnetic stirring bar, cap the bottle tightly, and stir until homogeneity is attained.

Sample solution: Transfer 5 g of Polyoxyl 20 Cetostearyl Ether to a suitable glass bottle of 60-mL capacity. Add 10 mL of chlorobenzene and 50 µL of *Internal standard solution*. Add a volume of chlorobenzene equal to the volume of the *Standard stock solution* added to prepare the *Standard solution*. Insert a magnetic stirring bar, cap the bottle tightly, and stir until homogeneity is attained.

Interference check solution: Transfer 5 g of Polyoxyl 20 Cetostearyl Ether to a suitable glass bottle of 60-mL capacity, and add 10 mL of chlorobenzene. Add an additional volume of chlorobenzene equal to the volume of the *Standard stock solution* used to prepare the *Standard solution*. Insert a magnetic stirring bar, cap the bottle tightly, and stir until homogeneity is attained.

Chromatographic system(See *Chromatography* <621>, *System Suitability*.)**Mode:** GC**Detector:** Flame ionization**Column:** 3-mm (OD) × 1.8-m stainless steel packed with S3**Temperatures****Injection port:** 210°**Detector:** 230°**Column:** 160°**Carrier gas:** Helium**Flow rate:** 66 mL/min**Injection volume:** 2 µL**System suitability**

Samples: Chlorobenzene, *Internal standard solution*, *Standard stock solution*, and *Interference check solution*

Interference check: Inject a suitable volume of chlorobenzene, and allow the chromatogram to run until the

solvent has eluted. Similarly inject the *Internal standard solution*, *Standard stock solution*, and *Interference check solution*. No interfering peaks are observed.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the weight of ethylene oxide in the portion of the sample taken:

$$W_T = (W_E \times W_U \times R_U) / [(W_U \times R_S) - (W_S \times R_U)] \times F$$

W_E = weight of ethylene oxide added to the *Standard solution* (mg)

W_U = weight of Polyoxyl 20 Cetostearyl Ether used to prepare the *Sample solution* (g)

R_U = peak area ratio of ethylene oxide to the internal standard from the *Sample solution*

R_S = peak area ratio of ethylene oxide to the internal standard from the *Standard solution*

W_S = weight of Polyoxyl 20 Cetostearyl Ether used to prepare the *Standard solution* (g)

F = unit conversion, mg to g (10^{-3})

Calculate the percentage of ethylene oxide in the portion of Polyoxyl 20 Cetostearyl Ether taken:

$$\text{Result} = (W_T / W_U) \times 100$$

W_T and W_U are as defined above.

Acceptance criteria: NMT 0.01%

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Hydroxyl Value* (401): 42–60
- **FATS AND FIXED OILS**, *Saponification Value* (401): NMT 2
- **PH** (791)

Sample solution: 100 mg/mL

Acceptance criteria: 4.5–7.5

- **WATER DETERMINATION**, *Method I* (921): NMT 1.0%

AVERAGE POLYMER LENGTH

Sample solution: Place the Polyoxyl 20 Cetostearyl Ether in a 50° water bath overnight to melt it completely. Shake vigorously to eliminate any possibility of molecular weight gradients within it, and transfer 200 µL to a 5- × 180-mm high-resolution NMR sample tube. Add 200 µL of deuterated chloroform by means of a separate microsyringe. Add 5 drops of tetramethylsilane as an internal reference standard. Cap the tube tightly, and shake thoroughly.

Analysis: Place the tube in the NMR spectrometer, and record the NMR spectrum at an appropriate RF power level and a sweep time of 250 s/500 Hz (see *Nuclear Magnetic Resonance* (761), *Qualitative Applications*). Adjust the spectrum amplitude so that the signal at 1.1 ppm is at least 80% of full scale. Record the integral areas, from 0.4 to 2.35 ppm (A_1), and from 2.35 to 4.9 ppm (A_2), at a sweep time of 50 s/500 Hz at an integral power level such that the integral of the ethylene oxide peak at 3.5 ppm is at least 80% of full chart height. Do not change the power level during the sweep. Record the integral of each peak several times, and calculate the average integral area.

Calculate the number of oxyethylene units per molecule taken:

$$\text{Result} = [32 \times A_2 / (A_1 - 3)] / 4$$

32 = total number of protons in the molecule not activated by oxygen, averaged for the cetyl and stearyl radicals

3 = number of oxygen-activated protons not included in the oxyethylene unit count

4 = number of protons in each oxyethylene unit

Acceptance criteria: 17.2–25.0

Sample: Undried specimen
Acceptance criteria: Meets the requirements

IMPURITIES

- **LIMIT OF FREE ETHYLENE OXIDE AND DIOXANE**
Analysis: Proceed as directed in *Ethylene Oxide and Dioxane* <228>, Method 1.
Acceptance criteria
Ethylene oxide: NMT 1 µg/g
Dioxane: NMT 10 µg/g

SPECIFIC TESTS

- **FATS AND FIXED OILS, Acid Value** <401>
Sample: 10.0 g
Acceptance criteria: NMT 1.0
- **FATS AND FIXED OILS, Peroxide Value** <401>: NMT 12.0
- **FATS AND FIXED OILS, Hydroxyl Value** <401>: See Table 1.
- **FATS AND FIXED OILS, Iodine Value** <401>: See Table 1.

- **FATS AND FIXED OILS, Saponification Value** <401>: See Table 1.

Table 1

	5–6 Ethylene Oxide Units	10 Ethylene Oxide Units
Hydroxyl value	50–70	65–90
Iodine value	50–60	27–34
Saponification value	105–120	68–85

- **FATS AND FIXED OILS, Fatty Acid Composition** <401>: Polyoxyl Oleate exhibits the composition profile of fatty acids shown in Table 2.

Table 2

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
14	0	≤5.0
16	0	≤16.0
18	0	≤6.0
16	1	≤8.0
18	1	65.0–88.0
18	2	≤18.0
18	3	≤4.0
>18	—	≤4.0

ALKALINITY

Sample solution: 100 mg/mL of Polyoxyl Oleate in alcohol

Analysis: To 2 mL of the *Sample solution* add 0.05 mL of phenol red TS.

Acceptance criteria: The solution is not red.

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>

Sample: 1.0 g

Acceptance criteria: NMT 0.3%

- **WATER DETERMINATION, Method I** <921>: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store in a cool, dry place. Protect from moisture.
- **LABELING:** Label it to indicate the number of ethylene oxide units per molecule (nominal value), and the name and concentration of any added antioxidant.
- **USP REFERENCE STANDARDS** <11>
USP Polyoxyl Oleate RS

Polyoxyl Stearate

R-CO-(OCH₂CH₂)_n-OH

R-CO-(OCH₂CH₂)_n-OOC-R

R = CH₃(CH₂)₁₆ or CH₃(CH₂)₁₄

n = 6–100

Polyethylene glycol stearate;

Polyethylene glycol monostearate;

Poly(oxy-1,2-ethanediyl), α-hydro-ω-hydroxyoctadecanoate [9004-99-3].

DEFINITION

Polyoxyl Stearate is a mixture of monoesters and diesters of mainly stearic (octadecanoic) acid and/or palmitic (hexadecanoic) acid and polyethylene glycols. The fatty acids may be of vegetable, animal, or synthetic origin. Polyoxyl Stearate Type I or Type II differs in its content of stearic acid. It may contain free polyethylene glycols. The aver-

age polymer length is equivalent to 6–100 ethylene oxide units per molecule (nominal value).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197A)
Sample: Use an undried specimen.
- **B.** It meets the requirements of the test for *Content of Stearic Acid and Palmitic Acid*.

ASSAY

• CONTENT OF STEARIC ACID AND PALMITIC ACID

Polyoxyl Stearate exhibits the composition profiles of fatty acids shown in *Table 1* below, as determined in *Fats and Fixed Oils* (401), *Fatty Acid Composition*.

Table 1

	Content of Stearic Acid and Palmitic Acid
Polyoxyl Stearate Type I	Stearic Acid: 40.0%–60.0%; sum of Palmitic and Stearic acids: NLT 90.0%
Polyoxyl Stearate Type II	Stearic Acid: 90.0%–99.0%; sum of Palmitic and Stearic acids: NLT 96.0%

• CONTENT OF FREE POLYETHYLENE GLYCOLS

[NOTE—This test is for Polyoxyl 40 Stearate only.]

Sample: 6 g of Polyoxyl 40 Stearate

Analysis: Transfer the *Sample* to a 500-mL separator containing 50 mL of ethyl acetate. Dissolve completely, then add 50 mL of sodium chloride solution (29 in 100), shake vigorously for 2 min, and allow to separate for 15 min. If separation is incomplete, carefully insert the separator into the well of a steam bath for short time intervals. Repeat this technique as many times as necessary to ensure the complete separation of the two phases. Cool, and drain the lower, aqueous phase into a second 500-mL separator. Extract the upper layer with a second 50-mL portion of sodium chloride solution (29 in 100). Repeat the separation as before, including the steam bath technique, to facilitate complete separation.

To the combined aqueous layers add 50 mL of ethyl acetate, shake vigorously for 2 min, and allow to separate as before. Drain the lower, aqueous phase into a third 500-mL separator, and extract it with two 50-mL portions of chloroform, shaking for 2 min each time. Repeat the steam bath technique to ensure complete separation.

Evaporate the combined chloroform extracts in a 150-mL beaker on a steam bath, with the aid of a stream of nitrogen, to apparent dryness.

Redissolve in about 15 mL of chloroform, and filter, collecting the filtrate in a weighed 150-mL beaker. Record the weight of the empty 150-mL beaker, W_1 , in g. Rinse the funnel with several small portions of chloroform, and evaporate the combined filtrate and rinsings, as described above, to remove chloroform or ethyl acetate. Dry in vacuum at 60° for 1 h. Cool in a desiccator, and weigh. Record the weight, W_2 , in g.

Calculate the percentage of free polyethylene glycols in Polyoxyl 40 Stearate taken:

$$\text{Result} = [(W_2 - W_1)/W] \times 100$$

W = weight of Polyoxyl 40 Stearate (g)

Acceptance criteria: 17%–27% of free polyethylene glycols for Polyoxyl 40 Stearate only

IMPURITIES

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* (561): NMT 0.3%, determined on 1.0 g

• LIMIT OF ETHYLENE OXIDE AND DIOXANE

Analysis: Proceed as directed in *Ethylene Oxide and Dioxane* (228), *Method II*.

Acceptance criteria

Ethylene oxide: 1 ppm

Dioxane: 380 ppm

SPECIFIC TESTS

• ALKALINITY

Phenol red solution: Dissolve 100 mg of phenolsulfonphthalein in a mixture of 2.82 mL of 0.1 M sodium hydroxide and 20 mL of alcohol, and dilute with water to 100 mL.

Sample solution: 2.0 g of Polyoxyl Stearate

Analysis: Dissolve the *Sample* in alcohol and dilute with alcohol to 20 mL. To 2 mL of this solution add 0.05 mL of *Phenol red solution*.

Acceptance criteria: The solution does not turn red.

• FATS AND FIXED OILS, Acid Value (401): NMT 6.0

• FATS AND FIXED OILS, Hydroxyl Value (401): Within the ranges specified in *Table 2*

• FATS AND FIXED OILS, Iodine Value (401): NMT 3.0

• FATS AND FIXED OILS, Peroxide Value (401): NMT 10.0

• FATS AND FIXED OILS, Saponification Value (401): Within the ranges specified in *Table 2*

• MELTING RANGE OR TEMPERATURE (741)

Sample: 10 g

Analysis: Melt the *Sample* at 80°–90°. Introduce a sufficient amount of the *Sample* into the tube by capillary action to form a column of the prescribed height in the tube. Allow to stand at 0° for 2 h.

Acceptance criteria: Within the ranges specified in *Table 2*

Table 2

Ethylene Oxide Units/Molecule (Nominal Value)	Melting Range or Temperature (°)	Hydroxyl Value	Saponification Value
6	26–37	80–110	90–115
8	26–35	80–105	88–100
32	46–50	20–40	30–45
40	Measure Congealing Temperature	25–40	25–35
75	53–59	15–35	8–25
100	48–60	15–30	5–20

• CONGEALING TEMPERATURE (651): 37°–47° for Polyoxyl 40 Stearate only

• WATER DETERMINATION, *Method I* (921): NMT 3.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in tight containers, and store at room temperature. Protect from light and moisture.

• LABELING:

Label it to indicate the number of ethylene oxide units/molecule (nominal value), and the type of Polyoxyl Stearate. Label it to indicate whether the fatty acids are derived from vegetable, animal, or synthetic sources.

• USP REFERENCE STANDARDS (11)

Polyoxyl Stearyl Ether

Polyethylene glycol monostearyl ether
CH₃(CH₂)₁₇(OCH₂CH₂)_nOH, n = 2–20 [9005-00-9].

DEFINITION

Polyoxyl Stearyl Ether is a mixture of the monostearyl ethers of mixed polyethylene glycols, the average polymer length being equivalent to NLT 2 and NMT 20 oxyethylene units (nominal value). It may contain various amounts of free stearyl alcohol and some free polyethylene glycol.

IDENTIFICATION

- A. INFRARED ABSORPTION** <197F>: Use a thin film of melted Polyoxyl Stearyl Ether.
- B. PROCEDURE**
Sample: 0.1 g
Analysis: Dissolve or disperse the Sample in alcohol. Add 10 mL of diluted hydrochloric acid, 5 mL of barium chloride TS, and 10 mL of phosphomolybdic acid solution (1 in 10).
Acceptance criteria: A precipitate is formed.
- C.** It meets the requirements in the test for *Fats and Fixed Oils, Hydroxyl Value* <401>.

IMPURITIES

Organic Impurities

- PROCEDURE: LIMIT OF FREE ETHYLENE OXIDE AND DIOXANE**
Analysis: Proceed as directed in *Ethylene Oxide and Dioxane* <228>, Method I.
Acceptance criteria
Ethylene oxide: NMT 1 µg/g (ppm)
Dioxane: NMT 10 µg/g (ppm)

SPECIFIC TESTS

- FATS AND FIXED OILS, Acid Value** <401>: NMT 1.0, determined on 5.0 g
- FATS AND FIXED OILS, Hydroxyl Value** <401>: Within the ranges specified in the table below

Oxyethylene Units/ Molecule (Nominal Value)	Hydroxyl Value
2	150–180
10	75–90
20	40–60

- FATS AND FIXED OILS, Iodine Value** <401>: NMT 2.0
- FATS AND FIXED OILS, Saponification Value** <401>: NMT 3.0, determined on 10.0 g
- ALKALINITY**
Sample: 2.0 g of Polyoxyl Stearyl Ether
Analysis: Dissolve the Sample to a hot mixture of 10 mL of alcohol and 10 mL of water. Add 0.05 mL of bromothymol blue TS. Titrate with 0.1 N hydrochloric acid to a yellow endpoint.
Acceptance criteria: NMT 0.5 mL of 0.1 N hydrochloric acid is required.
- WATER DETERMINATION, Method I** <921>: NMT 3.0%
- APPEARANCE OF SOLUTION:** 5.0 g of Polyoxyl Stearyl Ether in 50.0 mL of alcohol. The solution is not more intensely colored than a solution prepared immediately before use by mixing 12.0 mL of ferric chloride CS, 5.0 mL of cobaltous chloride CS, and 2.0 mL of cupric sulfate CS with dilute hydrochloric acid (10 g/L) to make 50.0 mL, and diluting 12.5 mL of this solution with dilute hydrochloric acid (10 g/L) to make 100.0 mL. Make the comparison

by viewing the substance and the solution downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* <631>).

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers, and store in a cool, dry place.
- LABELING:** Label it to indicate the average nominal number of oxyethylene units.
- USP REFERENCE STANDARDS** <11>

Sorbitan, mono-9-octadecenoate, poly(oxy-1,2-ethanediyl) derivs., (Z)-;
 Polyoxyethylene 20 sorbitan monooleate [9005-65-6].

DEFINITION

Polysorbate 80 is a mixture of partial esters of fatty acids, mainly oleic acid, with sorbitol and its anhydrides ethoxylated with approximately 20 moles of ethylene oxide for each mole of sorbitol and sorbitol anhydrides.

IDENTIFICATION

- It complies with the test for *Composition of Fatty Acids*.

ASSAY

COMPOSITION OF FATTY ACIDS

Diluent: 20 g/L of sodium hydroxide in methanol

Saturated sodium chloride solution: Sodium chloride and water (1:2). Before use, decant the solution from any undissolved substance and filter, if necessary.

Reference solution A: Prepare 0.50 g of the mixture of calibrating substances with the composition described in *Table 1*. Dissolve in heptane, and dilute with heptane to 50.0 mL.

Reference solution B: *Reference solution A* in heptane (1 in 10)

Reference solution C: Prepare 0.50 g of a mixture of fatty acid methyl esters, which corresponds to the composition of the substance to be examined. Dissolve in heptane, and dilute with heptane to 50.0 mL. [NOTE—Commercially available mixtures of fatty acid methyl esters may also be used.]

Sample solution: Dissolve 0.10 g of Polysorbate 80 in 2 mL of *Diluent* in a 25-mL conical flask, and boil under a reflux condenser for 30 min. Add 2.0 mL of 14% boron trifluoride-methanol through the condenser, and boil for 30 min. Add 4 mL of heptane through the condenser, and boil for 5 min. Cool and add 10.0 mL of *Saturated sodium chloride solution*, shake for about 15 s, and add a quantity of *Saturated sodium chloride solution* such that the upper phase is brought into the neck of the flask. Collect 2 mL of the upper phase, wash with three quantities, each of 2 mL, of water, and dry over anhydrous sodium sulfate.

Table 1

Mixture of the Following Substances	Composition (%)
Methyl myristate	5
Methyl palmitate	10
Methyl stearate	15
Methyl arachidate	20
Methyl oleate	20
Methyl eicosenoate	10
Methyl behenate	10
Methyl lignocerate	10

Chromatographic system

220	—	40

Carrier gas: Helium

Linear velocity: 50 cm/s

Injection size: 1 µL

System suitability

Samples: *Reference solution A* and *Reference solution B*

Suitability requirements

Resolution: NLT 1.8 between the peaks due to methyl oleate and methyl stearate, *Reference solution A*

Signal-to-noise ratio: NLT 5 for the peak of methyl myristate, *Reference solution B*

Theoretical plates: NLT 30,000 calculated for the peak of methyl stearate, *Reference solution A*

Analysis

Sample: *Sample solution*

Identify the peaks from *Reference solution C*. Calculate the percentage of each component in the *Sample solution*:

$$\text{Result} = A_c/A_T \times 100$$

A_c = peak area for the component of interest

A_T = total area of all peaks related to fatty acids

Acceptance criteria: Myristic acid, NMT 5.0%; palmitic acid, NMT 16.0%; palmitoleic acid, NMT 8.0%; stearic acid, NMT 6.0%; oleic acid, NLT 58.0%; linoleic acid, NMT 18.0%; linolenic acid, NMT 4.0%

IMPURITIES

Inorganic Impurities

- RESIDUE ON IGNITION:** Heat a silica or platinum crucible to redness for 30 min, allow to cool in a desiccator, and weigh. Evenly distribute 2.00 g of the substance to be examined in the crucible. Dry at 100° to 105° for 1 h and ignite to constant mass in a muffle furnace at 600 ± 25°, allowing the crucible to cool in a desiccator after each ignition. Flames should not be produced at any time during the procedure. If after prolonged ignition the ash still contains black particles, take up with hot water, pass through an ashless filter paper, and ignite the residue and the filter paper. Combine the filtrate with the ash, carefully evaporate to dryness, and ignite to constant mass.

Acceptance criteria: NMT 0.25%

- **HEAVY METALS**, *Method II* (231): NMT 10 ppm.

Organic Impurities

- **PROCEDURE: ETHYLENE OXIDE AND DIOXANE**

Ethylene oxide standard solution: Dilute 0.5 mL of a commercially available solution of ethylene oxide in methylene chloride (50 mg/mL) with water to 50.0 mL. [NOTE—The solution is stable for 3 months, if stored in vials with a teflon-coated, silicon membrane and crimped caps at -20° .] Allow to reach room temperature. Dilute 1.0 mL of this solution with water to 250.0 mL.

Dioxane standard solution: Dioxane in water (v/v) 1 in 20,000

Acetaldehyde standard solution: 0.01 mg/mL of acetaldehyde in water

Standard solution: Dilute 6.0 mL of *Ethylene oxide standard solution* and 2.5 mL of *Dioxane standard solution* with water to 25.0 mL.

Sample solution A: Transfer 1.0 g of Polysorbate 80 to a 10-mL headspace vial. Add 2.0 mL of water, and seal the vial immediately with a teflon-coated, silicon membrane and an aluminum cap.

Sample solution B: Transfer 1.0 g of Polysorbate 80 to a 10-mL headspace vial. Add 2.0 mL of *Standard solution*, and seal the vial immediately with a teflon-coated, silicon membrane and an aluminum cap.

Reference solution: Introduce 2.0 mL of *Acetaldehyde standard solution* and 2.0 mL of *Ethylene oxide standard solution* to a 10-mL headspace vial, and seal the vial immediately with a teflon-coated, silicon membrane and an aluminum cap.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: Headspace GC

Detector: Flame ionization

Column¹: 0.53-mm \times 50-m G27 on fused silica, film thickness 5 μ m

Temperature

Injector: 85°

Detector: 250°

Column: See the temperature program table below.

Temperature ($^{\circ}$)	Rate ($^{\circ}$ /min)	Time (min)
70 \rightarrow 250	10	—
250	—	5

Split ratio: 3:5

Carrier gas: Helium

Flow rate: 4.0 mL/min

Injection size: 1 mL

System suitability

Sample: *Reference solution*

[NOTE—The relative retention times for ethylene oxide, acetaldehyde, and dioxane are 1.0, 0.9, and 1.9, respectively. The retention time for ethylene oxide is about 6.5 min.]

Suitability requirements

Resolution: NLT 2.0 between the peaks due to acetaldehyde and ethylene oxide

Analysis

Samples: *Sample solution A* and *Sample solution B*
Calculate the content of ethylene oxide:

$$\text{Result} = (2 \times C_{EO} \times A_A) / (A_B - A_A)$$

C_{EO} = concentration of ethylene oxide in *Sample solution B* (μ g/mL)

A_A = peak area of ethylene oxide from *Sample solution A*

A_B = peak area of ethylene oxide from *Sample solution B*

Calculate the content of dioxane:

$$\text{Result} = (2 \times D \times C_D \times A_A) / (A_B - A_A)$$

D = density of dioxane, 1.03 g/mL

C_D = concentration of dioxane in *Sample solution B* (μ L/mL)

A_A = peak area of dioxane from *Sample solution A*

A_B = peak area of dioxane from *Sample solution B*

Acceptance criteria: NMT 1 ppm for ethylene oxide; NMT 10 ppm for dioxane

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 1.06–1.09

- **VISCOSITY—CAPILLARY VISCOMETER METHODS** (911) and **ROTATIONAL RHEOMETER METHODS** (912): 300–500 centistokes at 25°

Change to read:

- **FATS AND FIXED OILS**, *Acid Value* (401)

Sample solution: Dissolve 5.0 g in 50 mL of a mixture of equal volumes of alcohol and hexane (previously neutralized with 0.1 N potassium hydroxide or 0.1 N sodium hydroxide), using 0.5 mL of **phenolphthalein TS** (ERR 1-Jul-2012) as indicator. If necessary, heat to about 90° to dissolve the substance to be examined.

Analysis: Titrate the *Sample solution* with 0.1 N potassium hydroxide or 0.1 N sodium hydroxide until the pink color persists for at least 15 s. When heating has been applied to aid dissolution, maintain the temperature at about 90° during the titration.

Acceptance criteria: NMT 2.0

Change to read:

- **FATS AND FIXED OILS**, *Hydroxyl Value* (401)

Sample: 2.0 g

Analysis: Introduce the *Sample* into a 150-mL acetylation flask fitted with an air condenser. Add 5.0 mL of *Pyridine–Acetic Anhydride Reagent*, and attach the air condenser. Heat the flask in a water bath for 1 h keeping the level of the water about 2.5 cm above the level of the liquid in the flask. Withdraw the flask, and allow to cool. Add 5 mL of water through the upper end of the condenser. If a cloudiness appears, add sufficient pyridine to clear it, noting the volume added. Shake the flask, and replace in the water bath for 10 min. Withdraw the flask, and allow to cool. Rinse the condenser and the walls of the flask with 5 mL of alcohol, previously neutralized with **phenolphthalein TS** (ERR 1-Jul-2012). Titrate with 0.5 N alcoholic potassium hydroxide using 0.2 mL of **phenolphthalein TS** (ERR 1-Jul-2012) as indicator. Carry out a blank test under the same conditions.

Acceptance criteria: 65–80

- **FATS AND FIXED OILS**, *Peroxide Value* (401)

Sample: 10.0 g

Saturated potassium iodide solution: Prepare a saturated solution of potassium iodide in carbon dioxide-free water. Make sure the solution remains saturated as indicated by the presence of undissolved crystals.

Analysis: Introduce the *Sample* into a 100-mL beaker, and dissolve with 20 mL of glacial acetic acid. Add 1 mL of *Saturated potassium iodide solution*, and allow to stand for 1 min. Add 50 mL of carbon dioxide-free water and a magnetic stirring bar. Titrate with 0.01 M sodium thiosulfate, determining the endpoint potentiometrically. Carry out a blank titration.

¹ CP-Sil 8 CB is suitable.

- Acceptance criteria:** NMT 10
- **FATS AND FIXED OILS, Saponification Value (401)**
Sample: 4.0 g
Analysis: Introduce the *Sample* into a 250-mL borosilicate glass flask fitted with a reflux condenser. Add 30.0 mL of 0.5 N alcoholic potassium hydroxide and a few glass beads. Attach the condenser, and heat under reflux for 60 min. Add 1 mL of phenolphthalein TS and 50 mL of dehydrated alcohol, and titrate immediately with 0.5 N hydrochloric acid. Carry out a blank test under the same conditions.
Acceptance criteria: 45–55
 - **WATER DETERMINATION, Method I (921):** NMT 3.0%, determined on 1.0 g

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Store in an airtight container, protected from light.

Polyvinyl Acetate

(C₄H₆O₂)_n
 Vinyl acetate homopolymer
 Vinyl acetate resin [9003-20-7].

DEFINITION

Polyvinyl acetate is a thermoplastic polymer, represented by the formula:

in which the value of *n* lies between approximately 100 and 17,000.

IDENTIFICATION

- **A. PROCEDURE**
Sample: 100 mg of Polyvinyl Acetate
Analysis: Dissolve the *Sample* in 2.5 mL of acetone, place two drops on a potassium bromide plate, and dry to evaporate the solvent.
Acceptance criteria: The IR absorption spectrum of polyvinyl acetate exhibits maxima corresponding to the same wavelengths as that of a similar preparation of USP Polyvinyl Acetate RS, treated in the same manner.
- **B. PROCEDURE**
Sample: 0.5 g of Polyvinyl Acetate
Analysis: Saponify the *Sample* in a mixture of 25.0 mL of 0.5 N alcoholic potassium hydroxide and 25.0 mL of water.
Acceptance criteria: The solution so obtained meets the requirements of the tests for *Identification Tests—General* (191), *Acetate*.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION (281):** NMT 0.1%
- **HEAVY METALS, Method II (231):** NMT 10 ppm
- **RESIDUAL PEROXIDES**
Sample: 0.85 g of Polyvinyl Acetate
Analysis: Place the *Sample* in a borosilicate glass flask with a ground-glass neck. Add 10.0 mL of ethyl acetate, and heat under a reflux condenser with constant agitation. Allow to cool. Replace the air in the container with oxygen-free nitrogen, and add a solution of 1.0 mL of glacial acetic acid and 0.5 g of sodium iodide in 40.0 mL of water. Shake thoroughly, and allow to

stand protected from light for 20 min. Titrate with 0.005 N sodium thiosulfate VS until the yellow color is discharged. Perform a blank titration.

Acceptance criteria: The difference between the titration volumes is not greater than 1.0 mL; and NMT 100 ppm, calculated as hydrogen peroxide, is found.

Organic Impurities

PROCEDURE: LIMIT OF VINYL ACETATE

Standard stock solution: 1.0 mg/mL of Vinyl Acetate in toluene

Standard solutions: 0.1, 0.3, 1, 3, and 10 µg/mL of vinyl acetate in toluene, prepared from *Standard stock solution*

Sample solution: 0.1 g/mL of Polyvinyl Acetate in toluene

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Hydrogen flame ionization

Column: 0.32-mm × 30-m fused-silica capillary column, 5-µm layer of phase G1

Temperature

Detector: 250°

Injector port: 150°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	—	100	8
100	20	250	5

Carrier gas: Helium

Flow rate: Adjusted so that the vinyl acetate peak appears after about 7 min

Injection size: 1.0 µL

Injection type: Split ratio is about 8:1.

System suitability

Sample: *Standard solution* containing 1 µg/mL of vinyl acetate in toluene

Suitability requirements

Relative standard deviation: NMT 15%

Analysis

Samples: *Standard solution* and *Sample solution*
 Plot the peak responses of the vinyl acetate in the *Standard solutions* versus the concentration, in µg/mL, of vinyl acetate, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of vinyl acetate in the *Sample solution*.

Calculate the quantity, in µg, of vinyl acetate in each g of Polyvinyl Acetate taken:

$$\text{Result} = (C/C_p)$$

C = as determined above

C_p = concentration of the Polyvinyl Acetate in the *Sample solution* (g/mL)

Acceptance criteria: NMT 5 µg/g (5 ppm) of vinyl acetate

SPECIFIC TESTS

FATS AND FIXED OILS, Acid Value (401)

Sample: 10.0 g of Polyvinyl Acetate

Analysis: Transfer the *Sample* to a 250-mL glass-stoppered conical flask, dissolve in 75 mL of ethylene dichloride, add 60 mL of denatured alcoholic TS, and mix. Add 1 mL of phenolphthalein TS, and titrate with 0.02 N alcoholic potassium hydroxide VS until the solution remains faintly pink after shaking for 30 s. Perform a blank determination, and make any necessary correction.

Acceptance criteria: The acid value is NMT 0.5.

• **FATS AND FIXED OILS, Ester Value (401)**

Sample: 0.5 g of Polyvinyl Acetate

Analysis: Saponify the *Sample* in a mixture of 25.0 mL of 0.5 N alcoholic potassium hydroxide VS and 25.0 mL of water. Proceed as directed under *Fats and Fixed Oils* (401), *Saponification Value*, beginning with "Heat the flask on a steam bath".

Acceptance criteria: The ester value, calculated from the *Saponification Value* and the *Acid Value*, is between 615 and 675.

• **LOSS ON DRYING (731):** Dry 1.5 g at 100° for 2 h in a vacuum: it loses NMT 1.0% of its weight.

• **AVERAGE MOLECULAR WEIGHT AND MOLECULAR WEIGHT DISTRIBUTION**

[**CAUTION**—Tetrahydrofuran (THF) is considered to be a carcinogen and embryo-fetal toxic substance. It is also a peroxide former and is flammable. A safe-handling practice must be in place in the laboratory. Carefully review appropriate Material Safety Data Sheets before use.]

Mobile phase: Tetrahydrofuran inhibited with 250 ppm butylated hydroxytoluene. Do not sparge or degas.

Standard solutions: Prepare two sets of mixtures, each set containing five narrow polystyrene standards of different known molecular weights, totaling 10 narrow polystyrene standards covering the molecular weight range from about 600 to 3,000,000 g/mol.¹ Prepare each set of five narrow polystyrene standards to have a known concentration at about 0.05% (w/v) for each standard in *Mobile phase*.

Sample solution: Transfer 0.025 g of polyvinyl acetate to a vial, and add 10 mL of *Mobile phase*. Cap and mix well, using an appropriate laboratory shaker, for 1 h. Pass the polyvinyl acetate solution through a polytetrafluoroethylene filter having a porosity of 0.45 µm, discard an appropriate volume of the initial filtrate, and use the rest of the filtered solution for analysis.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive Index (RI)

Detector temperature: 35°

Columns: Two 10-mm × 50-cm analytical columns; 5-µm packing L73, and a 10-mm × 10-cm, 500-Å guard column; packing L73. [NOTE—The analytical column is suitable for molecular weight ranges from 100 to 10,000,000 g/mol.]

Flow rate: 1.1 mL/min

Injection size: 200 µL²

System suitability

Sample: *Standard solutions*

Suitability requirements

Resolution: NLT 1.7 between the polystyrene standards

Analysis

Samples: *Standard solutions* and *Sample solution*
Separately inject equal volumes of the *Standard solutions* and the *Sample solution* into the chromatograph, record the chromatograms, and determine the elution peak maxima and the corresponding retention volumes for the 10 polystyrene standards.

Universal calibration: Analyze each polystyrene standard, and use a data handling system or a suitable gel permeation chromatography or size exclusion chromatography (GPC/SEC) software to compute the data and calibration. Construct the *Universal calibration curve* as follows, and use it in the section *Data analysis for sample*.

Plot $\log([\eta] \times M_r)$ for each polystyrene standard in the *Standard solutions* versus its retention volume, V , in mL, at each standard peak maximum; and construct the best cubic line fitting the 10 points. In this expression, M_r is the molecular weight, in g/mol, of polystyrene standard; and $[\eta]$ is the intrinsic viscosity of a polymer and is related to polymer molecular weight (M_r), especially viscosity-average molecular weight, M_v , by the following Mark-Houwink equation:

$$[\eta] = K \times M_v^a$$

K = constant for a given polymer/solvent system at a specified temperature

a = constant for a given polymer/solvent system at a specified temperature

For polystyrene in THF at 25°, $K = 0.0128$ mL/g, and $a = 0.712$

For polyvinyl acetate in THF at 25°, $K = 0.025$ mL/g, and $a = 0.63$

Based on the Mark-Houwink equation and the fact that M_r can represent the molecular weight (M_r), the following equation is given:

$$\log([\eta] \times M_r) = \log K + (a + 1) \log(M_r)$$

M_r can be obtained as M_v , a viscosity-average molecular weight of polystyrene standard.

Data analysis for sample: Analyze the polyvinyl acetate sample by identifying retention volumes V_a and V_b , corresponding to the beginning and end of the polyvinyl acetate chromatogram. The baseline between V_a and V_b is assumed to be linear. [NOTE—Draw a straight line between V_a and V_b .] Data analysis is based on a suitable GPC/SEC computer software or a real-time data acquisition system with either offline or online data processing that is able to provide a means of determining chromatographic peak heights or integrated area segments at prescribed intervals under the SEC chromatogram and a means of handling and reporting the data. The following describes the data processes, which can be computed either by the GPC/SEC software or by an equivalent data processing system. Upon acquisition, handle the data under the polyvinyl acetate elution peak in discrete segments A_i , integrated area slices, or as digitized chromatogram heights H_i , by recording the vertical displacements between the chromatogram trace and the baseline at retention volume, V_i , over designated intervals. A minimum of 40 area segments or heights is required. Obtain the corresponding molecular weight value M_i for Polyvinyl Acetate at its retention volume, V_i , from the *Universal calibration curve* obtained in the section *Universal calibration*, since the constants K and a for Polyvinyl Acetate are known and given above.

Calculate the number-, weight-, and viscosity-average molecular weights, M_n , M_w , and M_v , respectively, in g/mol, of polyvinyl acetate, using the following formula:

$$M_n = \frac{\sum_{i=1}^N A_i}{\sum_{i=1}^N \left(\frac{A_i}{M_i} \right)}$$

$$M_w = \frac{\sum_{i=1}^N (A_i \cdot M_i)}{\sum_{i=1}^N A_i}$$

¹ Narrow polystyrene standards are available from polymer laboratories, such as EasiCal, or are available as various individual polystyrene standards.

² A sample loop of 400 µL and a syringe of 250 µL were used in the *Analysis*.

$$M_v = \left[\frac{\sum_{i=1}^N (A_i \cdot M_i^a)}{\sum_{i=1}^N A_i} \right]^{1/a}$$

If the retention volume internal ΔV_i (for instance, $V_2 - V_1 = V_3 - V_2$, etc.) is constant, parameters A_i and M_i are the chromatographic peak slice area and the Polyvinyl Acetate molecular weight associated with the retention volume, V_i ; and N is the number of data points obtained from the chromatogram between V_a and V_b ($N \geq 40$). [NOTE—If N is sufficiently large, the use of area segments A_i or peak heights H_i will yield equivalent results.]

Calculate the molecular weight distribution or polydispersity for Polyvinyl Acetate:

$$\text{Result} = M_w/M_n$$

Acceptance criteria: The values of weight-average molecular weight and polydispersity are, respectively, NLT 85% and NMT 115% of their respective values as stated on the label.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirement specified.
- **LABELING:** Label it to indicate its weight-average molecular weight, M_w , and polydispersity (M_w/M_n).
- **USP REFERENCE STANDARDS** <11>
USP Polyvinyl Acetate RS

Polyvinyl Acetate Dispersion

DEFINITION

Dispersion of polyvinyl acetate in water. It contains 25.0% to 30.0% of polyvinyl acetate. It may contain suitable surface active agents and stabilizers.

IDENTIFICATION

- **A.** Place one drop of Dispersion on a glass plate and allow to dry. A clear and homogeneous film is formed.
- **B. INFRARED ABSORPTION**

Analysis: Place one drop of the Dispersion on a glass plate, and cover the test substance with a water-resistant crystal disk (silver chloride or KRS-5¹). Gently press on, and then remove the crystal disk. Dry the crystal disk in a drying chamber until a homogeneous film is formed.

Acceptance criteria: The IR absorption spectrum of the film so formed exhibits maxima corresponding to the same wavelengths as those of a similar preparation of USP Polyvinyl Acetate Dispersion RS treated in the same manner.

ASSAY

PROCEDURE

Sample: 1.5 g of Dispersion

Analysis: Transfer the *Sample* to a 250-mL borosilicate glass flask fitted with a reflux condenser. Add 25.0 mL of 0.5 M alcoholic potassium hydroxide and a few glass beads. Attach the condenser and heat under reflux for 30 min. Add 1 mL of phenolphthalein TS, and titrate immediately (while still hot) with 0.5 N hydrochloric acid VS. Perform a blank determination under the same conditions (see *Titrimetry* <541>, *Residual Titrations*.)

¹ KRS-5 consists of 42% thallium(I) bromide and 58% thallium(I) iodine by molecular weight. Suitable disks of silver chloride and of KRS-5 are available from www.photonic.saint-gobain.com, www.almazoptics.com, and www.internationalcrystal.net.

Calculate the saponification value, I_s , by the formula:

$$\text{Result} = [M_{r1} \times (V_B - V_T)] \times N/W$$

- M_{r1} = molecular weight of potassium hydroxide, 56.11
 V_B = volume of 0.5 N hydrochloric acid consumed in the blank test (mL)
 V_T = volume of 0.5 N hydrochloric acid consumed in the actual test (mL)
 N = exact normality of the hydrochloric acid
 W = weight of the Dispersion taken for the test (g)
 Calculate the percentage content of polyvinyl acetate using the following formula:

$$\text{Result} = F \times (M_{r2} \times I_s/M_{r1}) \times 100$$

- F = factor converting mg to g, 10^{-3} g/mg
 M_{r2} = molecular weight of vinyl acetate, 86.09
 M_{r1} = molecular weight of potassium hydroxide, 56.11

Acceptance criteria: The content of polyvinyl acetate is 25.0%–30.0%.

OTHER COMPONENTS

Stabilizers or Surface Active Agents

POVIDONE

[NOTE—Perform this test only if the Dispersion contains povidone.]

Sample: 0.25 g

Analysis: Perform nitrogen determination by sulfuric acid digestion on the *Sample* as directed in *Nitrogen Determination* <461>, *Method II*.

Calculate the percentage content of povidone using the following formula:

$$\text{Result} = N/0.126$$

- N = percentage content of nitrogen
 0.126 = percentage content, expressed as a decimal number, of nitrogen in vinylpyrrolidone

Acceptance criteria: The content of povidone is NMT 4.0%.

IMPURITIES

Inorganic Impurities

RESIDUE ON IGNITION <281>

Sample: 1.0 g of Dispersion

Analysis: Heat a silica crucible to redness for 30 min, allow to cool in a desiccator, and weigh. Evenly distribute the *Sample* in the crucible and weigh. Dry the crucible at 100° to 105° for 1 h and ignite in a muffle furnace at 600° ± 25°, until the test substance is thoroughly charred. Continue the experiment as directed under *Residue on Ignition* <281> on the residue obtained, beginning with "Moisten the sample with a small amount (usually 1 mL) of sulfuric acid..."

Acceptance criteria: NMT 0.5%

Organic Impurities

PROCEDURE 1: LIMIT OF VINYL ACETATE

Solution A: Acetonitrile, methanol, and water (5:5:90)

Solution B: Acetonitrile, methanol, and water (45:5:50)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
40	85	15
42	0	100
48	0	100
51	100	0

Standard solution: Transfer 50 mg of vinyl acetate to a 100-mL volumetric flask, dissolve in and dilute with

methanol to volume, and mix well. Dilute 5.0 mL of the solution with *Solution A* to 100 mL. Dilute 10.0 mL of this solution with *Solution A* to 100 mL. The *Standard solution* contains about 2.5 µg/mL of vinyl acetate. [NOTE—This solution should be analyzed within 1 h when stored at room temperature.]

System suitability solution: Transfer 50 mg of vinyl acetate and 50 mg of 1-vinylpyrrolidin-2-one to a 50-mL volumetric flask, add 10 mL of methanol, sonicate or gently shake the flask to dissolve the materials. Dilute with *Solution A* to volume. Dilute 10 mL of this solution with *Solution A* to 100 mL. Dilute 5 mL of this solution with *Solution A* to 100 mL. The *System suitability solution* contains about 5 µg/mL each of vinyl acetate and 1-vinylpyrrolidin-2-one.

Sample solution: Transfer 250 mg of the Dispersion to a 10-mL volumetric flask, add about 4 mL of methanol, and sonicate. After cooling to ambient temperature, dilute with water to volume, and mix. Centrifuge at $4000 \times g$ for 10 min, and pass through a 0.2-µm membrane filter. [NOTE—This solution should be analyzed within 1 h when stored at room temperature.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Columns

Analytical column: 4.0-mm \times 25-cm; 5-µm packing L1

Pre-column: 4.0-mm \times 3-cm; 5-µm packing L1 may be used if a matrix effect is observed.

[NOTE—The matrix effect may result in poor reproducibility of the retention times and of the peak shapes.]

Column temperature: 30°

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for vinyl acetate and 1-vinylpyrrolidin-2-one are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 5.0 between vinyl acetate and 1-vinylpyrrolidin-2-one

Relative standard deviation: NMT 5.0% determined from the 1-vinylpyrrolidin-2-one peak

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: The response of the vinyl acetate peak from the *Sample solution* is NMT that of the vinyl acetate peak from the *Standard solution*, corresponding to NMT 100 ppm of vinyl acetate.

• PROCEDURE 2: LIMIT OF ACETIC ACID/ACETATE

Mobile phase: 5 mM sulfuric acid

Standard solution: 0.3 mg/mL for each of acetic acid and citric acid in *Mobile phase*

Sample solution: Transfer 200 mg of the Dispersion to a 10-mL volumetric flask, add about 8 mL of water, and sonicate for about 10 min. Cool to ambient temperature, and dilute with water to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm \times 25-cm; 5-µm packing L1

Column clean: After each injection, rinse the column with a mixture of equal volumes of *Mobile phase* and acetonitrile.

Column temperature: Ambient

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for acetic acid and citric acid are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 2.0 between acetic acid and citric acid

Relative standard deviation: NMT 5.0% determined from the acetic acid peak

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: The response of the acetic acid peak from the *Sample solution* is NMT that of the acetic acid peak from the *Standard solution*, corresponding to NMT 1.5% of acetic acid.

SPECIFIC TESTS

• MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>:

The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g

• PH <791>:

3.0–5.5

• LOSS ON DRYING <731>:

Dry 1.0 g of the Dispersion at 110° for 5 h: it loses between 68.5% and 71.5% of its weight.

• COAGULUM CONTENT

Sample: 100 g of Dispersion

Analysis: Accurately weigh a stainless steel sieve having 45-µm openings or a suitable single-woven wire cloth with a mesh width of 45 µm, and filter the *Sample* through it. [NOTE—Suitable single-woven wire cloth mesh meets the requirements set in ISO 9044.] Wash the sieve or the cloth with distilled water until a clear filtrate is obtained, and dry the sieve or the cloth to constant weight at 100°–105°.

Acceptance criteria: The weight of the residue does not exceed 500 mg (0.5%).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers at a temperature below 25°. Protect from freezing.

• **LABELING:** Label it to indicate the names and quantities of any added surface active agents and stabilizers.

• USP REFERENCE STANDARDS <11>

USP Polyvinyl Acetate Dispersion RS

Polyvinyl Acetate Phthalate

DEFINITION

Polyvinyl Acetate Phthalate is a reaction product of phthalic anhydride and a partially hydrolyzed polyvinyl acetate. It contains NLT 55.0% and NMT 62.0% of phthalyl (o-carboxybenzoyl, C₈H₅O₃) groups, calculated on the anhydrous, acid-free basis.

IDENTIFICATION

• **A.** The *Sample solution* in the Assay exhibits a maximum at 277 ± 3 nm.

• B.

Sample: 10 mg

Analysis: Place the *Sample* in a small test tube, add 10 mg of resorcinol, and mix. Add 0.5 mL of sulfuric acid, and heat in a liquid bath at 160° for 3 min. Cool, and pour the solution into a mixture of 25 mL of 1 N sodium hydroxide and 200 mL of water.

Acceptance criteria: The solution shows a vivid green fluorescence.

• **C.**

Sample solution: 100 mg/mL of Polyvinyl Acetate Phthalate in methanol

Analysis: Pour 1 mL of the *Sample solution* onto a clear glass plate.

Acceptance criteria: A film is deposited as the methanol evaporates.

ASSAY• **PHTHALYL CONTENT**

Standard solution: 0.05 mg/mL of phthalic anhydride in alcohol, prepared as follows. Transfer 50 mg of phthalic anhydride to a 1000-mL volumetric flask. Dissolve with heat in 100 mL of alcohol, dilute with alcohol to volume, and mix.

Sample solution: 0.1 mg/mL of Polyvinyl Acetate Phthalate in alcohol, prepared as follows. Transfer 100 mg of Polyvinyl Acetate Phthalate to a 1000-mL volumetric flask, dissolve in alcohol, and dilute with alcohol to volume.

Instrumental conditions

Mode: UV

Cell: 1 cm

Analytical wavelength: 275 nm

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate, on the acid-free basis, the percentage of phthalyl taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of phthalic anhydride in the *Standard solution* (mg/mL)

C_U = concentration of Polyvinyl Acetate Phthalate in the *Sample solution* (mg/mL)

Acceptance criteria: 55.0%–62.0% of phthalyl (o-carboxybenzoyl, $C_8H_5O_3$) groups on the anhydrous, acid-free basis

IMPURITIES• **RESIDUE ON IGNITION** (281): NMT 1.0%• **FREE PHTHALIC ACID**

Standard solution: 0.05 mg/mL of phthalic anhydride

Sample solution: 6 mg/mL of polyvinyl acetate in water prepared as follows. Dissolve 1500 mg of Polyvinyl Acetate Phthalate in 50 mL of a mixture of methylene chloride and methanol (4:1). Transfer the solution to a separator with the aid of 75 mL of water, and swirl, taking care not to shake. Add 100 mL of hexanes, shake, and allow the mixture to stand until it separates into two layers. Transfer the water layer to a 250-mL volumetric flask. Add 100 mL of water to the separator, shake, and allow to stand until the layers separate. Transfer the water layer to the same volumetric flask, and dilute with water to volume. If the solution is cloudy, centrifuge a portion until clear.

Instrumental conditions

Mode: UV

Cell: 1 cm

Analytical wavelength: 277 nm

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of free phthalic acid in the portion taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of phthalic anhydride in the *Standard solution* (mg/mL)

C_U = concentration of Polyvinyl Acetate Phthalate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of phthalic acid, 166.13

M_{r2} = molecular weight of phthalic anhydride, 148.12

Acceptance criteria: NMT 0.6% on the anhydrous basis

• **FREE ACID OTHER THAN PHTHALIC**

Sample solution: Proceed as directed for *Sample solution* in *Impurities, Free Phthalic Acid*, but instead of transferring the water extracts to a volumetric flask, transfer them to a 400-mL beaker.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Titrate the *Sample solution* with *Titrant* to a phenolphthalein endpoint.

Calculate the volume, V_p , in mL, of 0.1 N sodium hydroxide consumed by the free phthalic acid in the sample taken:

$$V_p = (1/M_r) \times (1/N) \times P \times W$$

M_r = equivalent weight of phthalic acid, 83.065 mg/mEq

N = actual normality of the *Titrant* (mEq/mL)

P = percentage of free phthalic acid, previously determined, in decimal form

W = sample weight of Polyvinyl Acetate Phthalate on the anhydrous basis (mg)

Calculate the percentage of free acid other than phthalic, as acetic acid, in the portion taken:

$$\text{Result} = [(V - V_p) \times M_{r3} \times N]/W \times 100$$

V = total volume of 0.1 N sodium hydroxide used (mL)

M_{r3} = equivalent weight of acetic acid, 60.05 mg/mEq

N = actual normality of the *Titrant*

W = sample weight on the anhydrous basis (mg)

Acceptance criteria: NMT 0.6% on the anhydrous basis

SPECIFIC TESTS• **VISCOSITY—CAPILLARY VISCOMETER METHODS** (911)

Sample solution: Dissolve a quantity, equivalent to 15 g on the anhydrous basis, in 85 g of methanol.

Analysis: Determine the viscosity of the *Sample solution*, using a capillary viscometer at $25 \pm 0.2^\circ$.

Acceptance criteria: The apparent viscosity is 7–11 mPa · s (centipoises).

• **WATER DETERMINATION, Method I** (921): NMT 5.0%**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in tight containers.

Polyvinyl Alcohol—see *Polyvinyl Alcohol General Monographs*

Potassium Alginate

Alginic acid, potassium salt;
Potassium alginate [9005-36-1].

DEFINITION

Potassium Alginate is the purified carbohydrate product extracted from various species of brown seaweeds by the use of dilute alkali. It consists chiefly of the potassium salt of Alginic Acid, a linear glycuronoglycan consisting of β -1,4-linked D-mannuronic acid and L-guluronic acid units in the pyranose ring form. It yields NLT 16.5% and NMT 19.5% of carbon dioxide (CO₂), equivalent to NLT 89.2% and NMT 105.5% of potassium alginate, calculated on the dried basis.

IDENTIFICATION

- **A.**
Analysis: To 5 mL of a 1-in-100 solution in 0.1 N sodium hydroxide add 1 mL of calcium chloride TS.
Acceptance criteria: A voluminous, gelatinous precipitate is formed.
- **B.**
Analysis: To 10 mL of a 1-in-100 solution in 0.1 N sodium hydroxide add 1 mL of 2 N sulfuric acid.
Acceptance criteria: A heavy, gelatinous precipitate is formed.
- **C.**
Analysis: To 5 mg in a test tube add 5 mL of water, 1 mL of a freshly prepared 1-in-100 solution of 1,3-naphthalenediol in alcohol, and 5 mL of hydrochloric acid. Heat the mixture to boiling, boil gently for 3 min, then cool to 15°. Transfer the contents of the test tube to a 30-mL separator with the aid of 5 mL of water, and extract with 15 mL of isopropyl ether.
Acceptance criteria: The isopropyl ether extract exhibits a deeper purplish hue than that from a blank, similarly prepared.
- **D. IDENTIFICATION TESTS—GENERAL, Potassium <191>**
Analysis: Ignite completely 0.2 g at as low a temperature as possible.
Acceptance criteria: A solution of the residue meets the requirements of the tests.

ASSAY

- **ALGINATES ASSAY <311>**: 16.5%–19.5% of CO₂, equivalent to 89.2%–105.5% of potassium alginate on the dried basis

IMPURITIES

- **ARSENIC, Method II <211>**: NMT 1.5 ppm
- **LEAD <251>**
Standard solution: 5 mL of *Diluted standard lead solution*
Test Preparation: Add 1.0 g to 20 mL of nitric acid in a 250-mL conical flask, mix, and heat carefully until the Potassium Alginate is dissolved. Continue the heating until the volume is reduced to 7 mL. Cool rapidly to room temperature, transfer to a 100-mL volumetric flask, and dilute with water to volume. Use a 50-mL sample of the *Test Preparation*.
Analysis: Proceed as directed in the chapter using 15 mL of ammonium citrate solution, 3 mL of potassium cyanide solution, and 0.5 mL of hydroxylamine hydrochloride solution being used for the test. After the first dithizone extractions, wash the combined chloroform layers with 5 mL of water, discarding the water layer and continuing in the usual manner by extracting with 20 mL of 0.2 N nitric acid.
Acceptance criteria: 50.0 mL portion of the *Test preparation* contains NMT 5 µg of lead (corresponding to NMT 10 ppm of lead)
- **HEAVY METALS, Method II <231>**
Analysis: Conduct the ignition in a platinum crucible, and use nitric acid in place of sulfuric acid to wet the sample.

Acceptance criteria: NMT 40 ppm

SPECIFIC TESTS

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash <561>**
Analysis: Proceed as directed for *Total Ash* under *Methods of Analysis*, carefully igniting 3 g in a tared platinum dish, until the residue is thoroughly carbonized (5 min), and then igniting in a muffle furnace at a temperature of 800 ± 25° until the carbon is completely burned off (approximately 75 min).
Acceptance criteria: 24.0%–32.0% of ash is found, calculated on the as-is basis.
- **MICROBIAL ENUMERATION TESTS <61> and TESTS FOR SPECIFIED MICROORGANISMS <62>**: The total aerobic microbial count does not exceed 10³ cfu/g, and the total combined molds and yeasts count does not exceed 10² cfu/g.
- **LOSS ON DRYING <731>**: Dry a sample at 105° for 4 h: it loses NMT 15% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

Potassium Benzoate

C₇H₅KO₂ 160.21
 Benzoic acid, potassium salt;
 Potassium benzoate [582-25-2].

DEFINITION

Potassium Benzoate contains NLT 99.0% and NMT 100.5% of potassium benzoate (C₇H₅KO₂), calculated on the anhydrous basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Potassium <191> and Benzoate <191>**: Meets the requirements for the flame test for *Potassium*; meets the requirements for *Benzoate*

ASSAY

- **PROCEDURE**
Sample: 600 mg of Potassium Benzoate
Blank: 100 mL of glacial acetic acid
Titrimetric system
 (See *Titrimetry* <541>.)
Mode: Direct titration
Titrant: 0.1 N perchloric acid VS
Endpoint detection: Visual
Analysis: Transfer the *Sample* to a 250-mL beaker. Add 100 mL of glacial acetic acid, stir until the *Sample* is completely dissolved, and add 2 drops of crystal violet TS. Titrate with *Titrant*. Perform a blank determination. Calculate the percentage of potassium benzoate (C₇H₅KO₂) in the portion of the *Sample* taken:

$$\text{Result} = \{(V_s - V_b) \times N \times F\} / W \times 100$$

V_s = volume of *Titrant* consumed by the *Sample* (mL)

V_b = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 160.2 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–100.5% on the anhydrous basis

IMPURITIES• **HEAVY METALS** (231)

Test preparation: Dilute 4.0 g in 40 mL of water. Add, dropwise, with vigorous stirring, 10 mL of 3 N hydrochloric acid, and filter. Use 25 mL of the filtrate.

Acceptance criteria: NMT 10 ppm

SPECIFIC TESTS• **ALKALINITY**

Sample: 2 g

Analysis: Dissolve the *Sample* in 20 mL in hot water, and add 2 drops of phenolphthalein TS.

Acceptance criteria: If a pink color is produced, it is discharged by the addition of 0.20 mL of 0.10 N sulfuric acid.

• **WATER DETERMINATION, Method I** (921): NMT 1.5%**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Potassium Carbonate—see *Potassium Carbonate General Monographs*

Potassium Chloride—see *Potassium Chloride General Monographs*

Potassium Citrate—see *Potassium Citrate General Monographs*

Potassium Hydroxide

KOH 56.11
Potassium hydroxide [1310-58-3].

DEFINITION

Potassium Hydroxide contains NLT 85.0% of total alkali, calculated as KOH, including NMT 3.5% of K_2CO_3 .

[**CAUTION**—Exercise great care in handling Potassium Hydroxide, because it rapidly destroys tissues.]

IDENTIFICATION• **A. IDENTIFICATION TESTS—GENERAL, Potassium (191):** A solution (1 in 25) meets the requirements.**ASSAY**• **PROCEDURE**

Sample: 1.5 g of Potassium Hydroxide

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 1 N sulfuric acid VS

Endpoint detection: Colorimetric

Analysis: Dissolve the *Sample* in 40 mL of carbon dioxide-free water. Cool the solution to 15°, and add phenolphthalein TS. Titrate with 1 N sulfuric acid VS. At the discharge of the pink color of the indicator, record the volume of acid solution required, then add methyl orange TS, and continue the titration to a persistent pink color. Each mL of 1 N sulfuric acid is equivalent to 56.11 mg of total alkali, calculated as KOH, and each mL of acid consumed in the titration with methyl orange is equivalent to 138.2 mg of K_2CO_3 .

Acceptance criteria: NLT 85.0% of total alkali, calculated as KOH, including NMT 3.5% of K_2CO_3

IMPURITIES• **HEAVY METALS** (231)

Test preparation: 0.67 g of Potassium Hydroxide in a mixture of 5 mL of water and 7 mL of 3 N hydrochloric acid. Heat to boiling, cool, and dilute with water to 25 mL.

Acceptance criteria: NMT 30 ppm

SPECIFIC TESTS• **INSOLUBLE SUBSTANCES**

Sample solution: 1 g of Potassium Hydroxide in 20 mL of water

Acceptance criteria: The *Sample solution* is complete, clear, and colorless.

ADDITIONAL REQUIREMENTS• **PACKAGING AND STORAGE:** Preserve in tight containers.**Potassium Metabisulfite**

$K_2S_2O_5$ 222.32
Disulfurous acid, dipotassium salt;
Dipotassium pyrosulfite [16731-55-8].

DEFINITION

Potassium Metabisulfite contains an amount of $K_2S_2O_5$ equivalent to NLT 51.8% and NMT 57.6% of SO_2 .

IDENTIFICATION• **A. IDENTIFICATION TESTS—GENERAL, Potassium (191) and Sulfite (191):** A solution (1 in 20) meets the requirements.**ASSAY**• **PROCEDURE**

Sample: 250 mg of Potassium Metabisulfite

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N iodine VS

Back titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a glass-stoppered conical flask containing 50.0 mL of 0.1 N iodine VS, and swirl to dissolve. Allow to stand for 5 min, protected from light, and then add 1 mL of hydrochloric acid. Titrate the excess iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached.

Calculate the percentage of SO_2 in the portion of *Sample* taken:

$$\text{Result} = \{[(V_B - V_S) \times N \times F] / W\} \times 100$$

V_B = Back titrant volume consumed by the Blank (mL)

V_S = Back titrant volume consumed by the Sample (mL)

N = Back titrant actual normality (mEq/mL)

F = equivalency factor, 32.03 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 51.8%–57.6% of SO_2

IMPURITIES• **IRON** (241)

Test preparation: Dissolve 1.00 g in 14 mL of dilute hydrochloric acid (2 in 7), and evaporate on a steam bath to dryness. Dissolve the residue in 7 mL of dilute hydrochloric acid (2 in 7), and again evaporate to dryness. Dissolve the resulting residue in a mixture of 2 mL of hydrochloric acid and 20 mL of water. Add 3 drops of bromine TS, and boil to expel the bromine. Cool, and dilute with water to 47 mL.

- Acceptance criteria: NMT 10 ppm
- **HEAVY METALS, Method I (231)**
Test preparation: Dilute 2 g in 20 mL of water, add 5 mL of hydrochloric acid, and evaporate on a steam bath to 1 mL. Dissolve the residue in 25 mL of water.
Acceptance criteria: NMT 10 ppm

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-fitted, tight containers, and avoid exposure to excessive heat.

Potassium Metaphosphate

KPO₃ 118.07
 Metaphosphoric acid (HPO₃), potassium salt;
 Potassium metaphosphate [7790-53-6].

DEFINITION

Potassium Metaphosphate is a straight-chain polyphosphate, having a high degree of polymerization. It contains the equivalent of NLT 59.0% and NMT 61.0% of P₂O₅.

IDENTIFICATION

- **A.**
Sample: 1 g, finely powdered
Analysis: Add the *Sample*, slowly and with vigorous stirring, to 100 mL of sodium chloride solution (20 mg/mL).
Acceptance criteria: A gelatinous mass is formed.
- **B. IDENTIFICATION TESTS—GENERAL, Potassium (191)**
Sample: 0.5 g
Analysis: Boil a mixture of the *Sample*, 10 mL of nitric acid, and 50 mL of water for 30 min, and cool.
Acceptance criteria: The resulting solution meets the requirements of the test.
- **C. IDENTIFICATION TESTS—GENERAL, Phosphate (191)**
Sample: 0.5 g
Analysis: Boil a mixture of the *Sample*, 10 mL of nitric acid, and 50 mL of water for 30 min, and cool.
Acceptance criteria: The resulting solution meets the requirements of the test.

ASSAY

- **PROCEDURE**
Sample: 200 mg
Titrimetric system
 (See *Titrimetry* (541).)
Mode: Residual titration
Titrant: 1 N sodium hydroxide VS
Back-titrant: 1 N sulfuric acid VS
Endpoint detection: Visual
Analysis: Mix the *Sample* with 15 mL of nitric acid and 30 mL of water. Boil for 30 min, cool, and dilute with water to 100 mL. Heat to 60°, add an excess of ammonium molybdate TS, and heat at 50° for 30 min. Filter, and wash the precipitate, first with 0.5 N nitric acid, and then with 10 mg/mL of potassium nitrate until the filtrate is no longer acid to litmus. Add 25 mL of water to the precipitate, dissolve it in 50.0 mL of *Titrant*, and add phenolphthalein TS. Titrate the excess sodium hydroxide with *Back-titrant*. Each mL of *Titrant* is equivalent to 3.086 mg of P₂O₅.
Acceptance criteria: 59.0%–61.0%

IMPURITIES

- **LEAD (251)**
Sample solution: 1 g of Potassium Metaphosphate in 10 mL of 3 N hydrochloric acid
Acceptance criteria: The *Sample solution* contains NMT 5 µg of lead (corresponding to NMT 5 ppm of Pb).

- **HEAVY METALS, Method I (231)**

Sample: Warm 1 g of Potassium Metaphosphate with 10 mL of 3 N hydrochloric acid until no more dissolves. Add 15 mL of water, mix and filter.

Acceptance criteria: NMT 20 ppm

- **LIMIT OF FLUORIDE**

Control: Water

Sample solution: Place 5.0 g of Potassium Metaphosphate, 25 mL of water, 50 mL of perchloric acid, 5 drops of 500 mg/mL silver nitrate, and a few glass beads in a 250-mL distilling flask connected with a condenser and carrying a thermometer and a capillary tube, both of which extend into the liquid. Connect a small dropping funnel, filled with water, or a steam generator to the capillary tube. Support the flask on a distillation shield with a hole that exposes one-third of the bottom of the flask to the flame. Distill into a 250-mL volumetric flask until the temperature reaches 135°. Add water from the funnel or introduce steam through the capillary to maintain the temperature between 135° and 140°. Continue the distillation until 225–240 mL has been collected, then dilute with water to volume.

Analysis: Transfer 50.0 mL of the *Sample solution* to a 100-mL color-comparison tube, and transfer 50.0 mL of the *Control* to a similar tube. Add to each tube 0.1 mL of a filtered solution of sodium alizarin-sulfonate TS and 1 mL of freshly prepared 0.25 mg/mL hydroxylamine hydrochloride. Add, dropwise and with stirring, 0.05 N sodium hydroxide to the tube containing the distillate until its color just matches that of the *Control*, which is faintly pink. Then add to each tube 1.0 mL of 0.1 N hydrochloric acid. From a buret, graduated in 0.05-mL increments, add slowly to the tube containing the distillate, enough 0.25-mg/mL thorium nitrate solution so that, after mixing, the color of the liquid just changes to a faint pink. Note the volume of the solution added, add the same volume to the *Control*, and mix. Then add sodium fluoride TS (10 µg/mL of F) to the *Control* from a buret to make the colors of the two tubes match after dilution to the same volume. Mix, and allow all air bubbles to escape before making the final color comparison. Check the endpoint by adding 1 or 2 drops of sodium fluoride TS to the control. A distinct change in color appears.

Acceptance criteria: 10 µg/g; the volume of sodium fluoride TS required for the *Control* is NMT 1.0 mL.

SPECIFIC TESTS

- **VISCOSITY—CAPILLARY VISCOMETER METHODS (911) and ROTATIONAL RHEOMETER METHODS (912)**

Sample solution: Mix 300 mg with 200 mL of 3.5 mg/mL sodium pyrophosphate, using a magnetic stirrer.

Analysis: Determine the viscosity of the clear solution obtained, or of the liquid phase of the mixture obtained after 30 min of continuous stirring.

Acceptance criteria: 6.5–15 centipoises

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Monobasic Potassium Phosphate

KH₂PO₄
 Phosphoric acid, monopotassium salt;
 Monopotassium phosphate [7778-77-0].

136.09

DEFINITION

Monobasic Potassium Phosphate, dried at 105° for 4 h, contains NLT 98.0% and NMT 100.5% of monobasic potassium phosphate (KH₂PO₄).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Potassium** <191>
Sample solution: 50 mg/mL
Acceptance criteria: Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Phosphate** <191>
Sample solution: 50 mg/mL
Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Sample solution: Transfer 5 g of Monobasic Potassium Phosphate, previously dried, to a 250-mL beaker. Add 100 mL of water and 5.0 mL of 1 N hydrochloric acid VS, and stir until the assay specimen is completely dissolved.

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 1 N sodium hydroxide VS

Endpoint detection: Potentiometrically

Analysis: Slowly titrate the excess acid in the *Sample solution*, stirring constantly, with *Titrant* to the inflection point occurring at about pH 4 (*V*_{S1}). Continue the titration with *Titrant* until the inflection point occurring at about pH 8.8 is reached (*V*_{S2}).

Calculate the percentage of monobasic potassium phosphate (KH₂PO₄) in the sample taken:

$$\text{Result} = \{[(V_{S2} - V_{S1}) \times N \times F] / W\} \times 100$$

*V*_{S2} = *Titrant* volume consumed by the *Sample solution* to the second inflection point (mL)

*V*_{S1} = *Titrant* volume consumed by the *Sample solution* to the first inflection point (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 0.1361 g/mEq

W = weight of monobasic potassium phosphate taken to prepare the *Sample solution* (g)

Acceptance criteria: 98.0%–100.5% on the previously dried basis

IMPURITIES

- **ARSENIC, Method I** <211>: 3 µg/g
- **LEAD** <251>
Test preparation: 1 g in 20 mL of water
Acceptance criteria: NMT 5 µg/g
- **HEAVY METALS, Method I** <231>
Test preparation: 40 mg/mL
Acceptance criteria: NMT 20 µg/g
- **LIMIT OF FLUORIDE**

[NOTE—Prepare and store all solutions in plastic containers.]

Buffer solution: 294 mg/mL of sodium citrate dihydrate

Standard stock solution: 1.1052 mg/mL of USP Sodium Fluoride RS

Standard solution: Dilute 20.0 mL of *Standard stock solution* and 50.0 mL of *Buffer solution* with water to 100 mL. Each mL of this solution contains 100 µg of fluoride ion.

Sample solution: Transfer 2.0 g of Monobasic Potassium Phosphate to a beaker containing a plastic-coated stirring bar. Add 20 mL of water and 2.0 mL of hydrochloric acid, and stir until dissolved. Add 50.0 mL of *Buffer solution* and sufficient water to make 100 mL.

Electrode system: Use a fluoride-specific ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ±0.2 mV (see *pH* <791>).

Analysis

Standard response line: Transfer 50.0 mL of *Buffer solution* and 2.0 mL of hydrochloric acid to a beaker, and add water to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential, in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, and 500 µL of *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, and 1.0 µg/mL) versus potential, in mV.

Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential in mV. From the measured potential and the *Standard response line* determine the concentration, *C* (in µg/mL), of fluoride ion in the *Sample solution*.

Calculate the content of fluoride in the portion of Monobasic Potassium Phosphate taken:

$$\text{Result} = (V \times C) / W$$

V = volume of the *Sample solution* (mL)

C = concentration of fluoride ion, determined from the *Standard response line*, in the *Sample solution* (µg/mL)

W = weight of Monobasic Potassium Phosphate taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 10 µg/g

SPECIFIC TESTS• **INSOLUBLE SUBSTANCES**

Sample solution: 10 g in 100 mL of hot water

Analysis: Filter the *Sample solution* through a tared filtering crucible, wash the insoluble residue with hot water, and dry at 105° for 2 h.

Acceptance criteria: NMT 20 mg (0.2%)

• **LOSS ON DRYING** <731>

Analysis: Dry a sample at 105° for 4 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>
USP Sodium Fluoride RS

Potassium Sorbate

C₆H₇KO₂ 150.22
2,4-Hexadienoic acid, (*E,E*)-, potassium salt;
2,4-Hexadienoic acid, potassium salt;
Potassium (*E,E*)-sorbate;
Potassium sorbate [590-00-1; 24634-61-5].

DEFINITION

Potassium Sorbate contains NLT 98.0% and NMT 101.0% of C₆H₇KO₂, calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Potassium** <191>
Sample: Dissolve 1 g of Potassium Sorbate in 10 mL of water.
Acceptance criteria: Meets the requirements
- **B.**
Sample: 0.2 g of Potassium Sorbate
Analysis: Dissolve the *Sample* in 2 mL of water, and add a few drops of bromine TS.

Acceptance criteria: The color is discharged.

ASSAY

PROCEDURE

Sample: 300 mg of Potassium Sorbate

Blank: 40 mL of glacial acetic acid

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 40 mL of glacial acetic acid, warming, if necessary, to dissolve the solution.

Cool to room temperature, and add 1 drop of crystal violet TS. Titrate with *Titrant* to a blue-green endpoint. Perform a blank determination.

Calculate the percentage of potassium sorbate ($C_6H_7KO_2$) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* consumed by the *Sample* (mL)

V_B = *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 150.2 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES

- **HEAVY METALS,** *Method II* <231>: NMT 10 ppm

SPECIFIC TESTS

ACIDITY OR ALKALINITY

Sample solution: 1.1 g of Potassium Sorbate in 20 mL of water

Analysis: Add phenolphthalein TS to the *Sample* solution.

Acceptance criteria: If the solution is colorless, titrate with 0.10 N sodium hydroxide to a pink color that persists for 15 s: NMT 1.1 mL of 0.10 N sodium hydroxide is required. If the solution is pink in color, titrate with 0.10 N hydrochloric acid to discharge the pink color: NMT 0.80 mL of 0.10 N hydrochloric acid is required.

- **LOSS ON DRYING** <731>: Dry a sample at 105° for 3 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light, and avoid exposure to excessive heat.

Povidone—see *Povidone General Monographs*

Propane

C_3H_8 44.10
[74-98-6].

DEFINITION

Propane contains NLT 98.0% of propane (C_3H_8).

[CAUTION]—Propane is highly flammable and explosive.]

IDENTIFICATION

- **A. INFRARED ABSORPTION:** Exhibits maxima, among others, at the following wavelengths, in μm : 3.4 (vs), 6.8 (s), and 7.2 (m).

B.

Sample: Use an empty stainless steel cylinder equipped with a stainless steel valve and having a capacity of NLT 200 mL and a pressure rating of 240 psi or more. Dry the cylinder with the valve open at 110° for 2 h, and evacuate the hot cylinder to less than 1 mm of mercury.

Close the valve, cool, and weigh. Connect one end of a charging line tightly to the propane container and the other end loosely to the empty cylinder. Carefully open the propane container, and allow the propane to flush out the charging line through the loose connection. Avoid excessive flushing, which causes moisture to freeze in the charging line and connections. Tighten the fitting on the empty cylinder, and open the empty cylinder valve, allowing the propane to flow into the evacuated cylinder. Continue sampling until the desired amount of propane is obtained, then close the propane container valve, and finally close the sample cylinder valve. **[CAUTION]**—Do not overload the sample cylinder; hydraulic expansion due to temperature change can cause overloaded cylinders to explode.] Weigh the charged sample cylinder, and determine the the weight.

Analysis: Determine the vapor pressure of the *Sample* at 21° by means of a suitable pressure gauge.

Acceptance criteria: 820–875 kPa absolute (119–127 psia)

ASSAY

PROCEDURE

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Thermal conductivity

Column: 6-m \times 3-mm aluminum; packed with 10 weight percent of liquid phase G30 on nonacid-washed support S1C

Column temperature: 33°

Carrier gas: Helium

Flow rate: 50 mL/min

Injection volume: 2 μL

System suitability

Sample: Propane

Suitability requirements: The peak responses for Propane from duplicate determinations agree within 1%.

Analysis: Connect 1 Propane cylinder to the chromatograph through a suitable sampling valve and a flow control valve downstream from the sampling valve. Flush the liquid specimen through the sampling valve, taking care to avoid entrapment of gas or air in the sampling valve. Calculate the percentage purity by dividing 100 times the propane response by the sum of all of the responses.

Acceptance criteria: NLT 98.0%

SPECIFIC TESTS

HIGH-BOILING RESIDUES

Sample: Use the *Sample* from *Identification* test B.

Analysis: Prepare a cooling coil from copper tubing (about 6-mm outside diameter \times about 6.1-m long) to fit into a vacuum-jacketed flask. Immerse the cooling coil in a mixture of dry ice and acetone in a vacuum-jacketed flask, and connect one end of the tubing to the *Sample*. Carefully open the sample cylinder valve, flush the cooling coil with about 50 mL of the *Sample*, and discard this portion of liquefied sample. Continue delivering liquefied sample from the cooling coil, and collect it in a previously chilled 1000-mL sedimentation cone until the cone is filled to the 1000-mL mark. Allow the sample to evaporate, using a warm water bath maintained at about 40° to reduce evaporating time. When all of the liquid has evaporated, rinse the sedimentation cone with two 50-mL portions of pentane, and combine the rinsings in a tared 150-mL evaporating dish. Transfer 100 mL of the pentane solvent to a

second tared 150-mL evaporating dish, place both evaporating dishes on a water bath, evaporate to dryness, and heat the dishes in an oven at 100° for 60 min. Cool the dishes in a desiccator, and weigh. Repeat the heating for 15-min periods until successive weighings are within 0.1 mg, and calculate the weight of the residue obtained from the *Sample* as the difference between the weights of the residues in the two evaporating dishes.

Acceptance criteria: NMT 5 µg/mL

• **ACIDITY OF RESIDUE**

Sample solution: Add 10 mL of water to the residue obtained in the test for *High-Boiling Residues*, mix by swirling for 30 s, add 2 drops of methyl orange TS, insert the stopper in the tube, and shake vigorously.

Acceptance criteria: No pink or red color appears in the aqueous layer.

• **LIMIT OF SULFUR COMPOUNDS**

Analysis: Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose.

Acceptance criteria: The odor is free from the characteristic odor of sulfur compounds.

• **WATER DETERMINATION (921)**

Sample: 100 g of the *Sample* from Identification test B

Analysis: Proceed as directed in the chapter with the following modifications. (a) Provide the closed-system titrating vessel with an opening through which passes a coarse-porosity gas dispersion tube connected to a sampling cylinder. (b) Dilute the *Reagent* with anhydrous methanol to give a water equivalence factor of 0.2–1.0 mg/mL; age this diluted solution for NLT 16 h before standardization. (c) Introduce the *Sample* into the titration vessel through the gas dispersion tube at a rate of about 100 mL/min; if necessary, heat the sample cylinder gently to maintain this flow rate.

Acceptance criteria: NMT 0.001%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight cylinders, and prevent exposure to excessive heat.

Propionic Acid

DEFINITION

Propionic Acid contains NLT 99.5% and NMT 100.5%, by weight, of propionic acid (C₃H₆O₂).

ASSAY

• **PROCEDURE**

Sample: 1.5 g of Propionic Acid

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.5 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Mix the *Sample* with 100 mL of recently boiled and cooled water in a 250-mL conical flask. Add phenolphthalein TS to the *Sample solution*, and titrate with *Titrant* to the first appearance of a faint pink endpoint that persists for NLT 30 s.

Calculate the percentage of propionic acid (C₃H₆O₂) in the sample taken:

$$\text{Result} = \{[(V_s - V_b) \times N \times F]/W\} \times 100$$

V_s = volume of *Titrant* consumed by the sample (mL)

V_b = volume of *Titrant* consumed by the blank (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 74.08 mg/mEq

W = weight of the sample (mg)

Acceptance criteria: 99.5%–100.5% by weight

IMPURITIES

- **LIMIT OF NONVOLATILE RESIDUE:** Evaporate 20 g of Propionic Acid in a tared dish, and dry at 105° for 1 h: the weight of the residue does not exceed 2.0 mg.

• **HEAVY METALS (231)**

Test preparation: To the residue obtained in the test for *Limit of Nonvolatile Residue* add 8 mL of 0.1 N hydrochloric acid, warm gently until solution is complete, dilute with water to 100 mL, and use 10 mL of the solution.

Acceptance criteria: NMT 10 ppm

• **LIMIT OF ALDEHYDES**

Sample solution: Transfer 10.0 mL of Propionic Acid to a glass-stoppered 250-mL conical flask containing 50 mL of water and 10.0 mL of sodium bisulfite solution (1 in 80), insert the stopper, and shake vigorously. Allow the mixture to stand for 30 min.

Blank: Add 50 mL of water and 10.0 mL of sodium bisulfite solution (1 in 80) to a glass-stoppered 250-mL conical flask, insert the stopper, and shake vigorously. Allow the mixture to stand for 30 min.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N iodine VS

Endpoint detection: Visual

Analysis: Titrate the *Sample solution* and the *Blank* with *Titrant* to the same brownish-yellow endpoint.

Acceptance criteria: The difference between the volume of 0.1 N iodine required for the *Blank* and that required for the *Sample solution* is NMT 1.75 mL.

SPECIFIC TESTS

- **DISTILLING RANGE, Method I (721):** 138.5°–142.5°

- **SPECIFIC GRAVITY (841):** 0.988–0.993

• **READILY OXIDIZABLE SUBSTANCES**

Sample solution: Dissolve 15 g of sodium hydroxide in 50 mL of water. Cool, add 6 mL of bromine, stirring to effect complete solution, and dilute with water to 2000 mL. Transfer 25.0 mL of this solution to a glass-stoppered, 250-mL conical flask containing 100 mL of water, and add 10 mL of sodium acetate solution (1 in 5) and 10.0 mL of Propionic Acid. Allow to stand for 15 min, and add 5 mL of potassium iodide solution (1 in 4) and 10 mL of hydrochloric acid.

Blank: Dissolve 15 g of sodium hydroxide in 50 mL of water. Cool, add 6 mL of bromine, stirring to effect complete solution, and dilute with water to 2000 mL. Transfer 25.0 mL of this solution to a glass-stoppered, 250-mL conical flask containing 100 mL of water, and add 10 mL of sodium acetate solution (1 in 5). Allow to stand for 15 min, and add 5 mL of potassium iodide solution (1 in 4) and 10 mL of hydrochloric acid.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Titrate the *Sample solution* and the *Blank* with *Titrant* just to the disappearance of the brown color.

Acceptance criteria: The difference between the volume of 0.1 N sodium thiosulfate required for the *Blank* and that required for the *Sample solution* is NMT 2.2 mL.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Propyl Gallate

C₁₀H₁₂O₅

212.20

Benzoic acid, 3,4,5-trihydroxy-, propyl ester;
Propyl gallate [121-79-9].

DEFINITION

Propyl Gallate contains NLT 98.0% and NMT 102.0% of propyl gallate (C₁₀H₁₂O₅), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197M>
- **B. ULTRAVIOLET ABSORPTION** <197U>
Sample solution: 10 µg/mL in methanol
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**
Standard solution: 10 µg/mL of USP Propyl Gallate RS in methanol
Sample solution: 10 µg/mL of Propyl Gallate in methanol
Blank: Methanol
Instrumental conditions
(See *Spectrophotometry and Light-Scattering* <851>.)
Mode: UV
Analytical wavelength: Maximum at about 273 nm
Cell: 1 cm
Analysis
Samples: Standard solution and Sample solution
Calculate the percentage of propyl gallate (C₁₀H₁₂O₅) in the portion of the sample taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the Sample solution

A_S = absorbance of the Standard solution

C_S = concentration of USP Propyl Gallate RS in the Standard solution (µg/mL)

C_U = concentration of the Sample solution (µg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **HEAVY METALS**, Method II <231>: NMT 10 ppm

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** <741>: 146°–150°
- **LOSS ON DRYING** <731>: Dry a sample at 105° for 4 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers, protected from light, and avoid contact with metals.
- **USP REFERENCE STANDARDS** <11>
USP Propyl Gallate RS

Propylene Carbonate

C₄H₆O₃

102.09

4-Methyl-1,3-dioxolan-2-one;

Cyclic propylene carbonate [108-32-7].

DEFINITION

Propylene Carbonate contains NLT 99.0% and NMT 100.5% of propylene carbonate (C₄H₆O₃).

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>

ASSAY

• PROCEDURE

Barium hydroxide solution: 75 mg/mL of barium hydroxide (octahydrate). Filter the solution before use.

Sample: 600 mg

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.5 N hydrochloric acid VS

Endpoint detection: Visual

Analysis: Flush a 250-mL iodine flask with nitrogen to expel the air, and insert the stopper in the flask to exclude carbon dioxide. Transfer 50.0 mL of *Barium hydroxide solution* and the *Sample* to the flask, and loosely reinsert the stopper. Moisten the stopper with 3 drops of water, and heat the flask on a steam bath for 10 min. Remove the flask from the steam bath, add 6 drops of phenolphthalein TS, and titrate while hot with *Titrant* until only a trace of pink color remains. Perform a blank determination, using the same *Barium hydroxide solution*. Each mL of 0.5 N hydrochloric acid consumed is equivalent to 25.52 mg of propylene carbonate (C₄H₆O₃).

Acceptance criteria: 99.0%–100.5%

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.01%

SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>: 1.203–1.210 at 20°
- **PH** <791>

Sample solution: Mix 10 mL of propylene carbonate with 0.3 mL of saturated potassium chloride solution in a 100-mL borosilicate volumetric flask. Dilute with carbon dioxide-free water having a pH of 7.0 ± 0.5 to volume.

Analysis: Completely purge the solution by vigorous nitrogen bubbling, and continue the bubbling during the pH measurement. Determine the pH potentiometrically when the reading stabilizes.

Acceptance criteria: 6.0–7.5

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>
USP Propylene Carbonate RS

Propylene Glycol—see *Propylene Glycol*
General Monographs

Propylene Glycol Alginate

DEFINITION

Propylene Glycol Alginate is a propylene glycol ester of alginic acid. Each gram yields NLT 0.16 and NMT 0.20 g of carbon dioxide, calculated on the dried basis.

IDENTIFICATION

• A.

Sample solution: Place 20 mL of the saponified solution obtained in the determination of *Esterified Carboxyl*

Groups in a 250-mL conical flask. Add 50 mL of a solution of periodic acid (1 in 50), swirl, and allow to stand for 30 min. Add 2 g of potassium iodide, titrate with sodium thiosulfate TS to a faint yellow color, dilute the mixture with water to 200 mL, and mix to obtain the *Sample solution* for *Identification* test A and *Identification* test B.

Modified Schiff's reagent: Dissolve 200 mg of rosaniline hydrochloride ($C_{20}H_{20}ClN_3$) in 120 mL of hot water. Cool, add 2 g of sodium bisulfite ($NaHSO_3$), followed by 2 mL of hydrochloric acid, and dilute with water to 200 mL. [NOTE—Store this solution in a brown bottle at 15° or lower.]

Analysis: To 10 mL of the *Sample solution* add 5 mL of hydrochloric acid and 10 mL of *Modified Schiff's reagent*.

Acceptance criteria: A blue to blue-violet color, due to formaldehyde, develops in about 20 min.

• **B.**

Analysis: To 10 mL of the *Sample solution* prepared in *Identification* test A add 1 mL of a saturated solution of piperazine and 0.5 mL of sodium nitroferricyanide TS.

Acceptance criteria: A green color, due to acetaldehyde, develops.

ASSAY

• **CONTENT OF ALGINATE**

Analysis: Proceed as directed for *Procedure* in *Alginates* Assay (311), without preliminary drying of the Propylene Glycol Alginate.

Acceptance criteria: 0.16–0.20 g of carbon dioxide/g of Propylene Glycol Alginate, calculated on the dried basis

OTHER COMPONENTS

• **FREE CARBOXYL GROUPS**

Sample: 1 g

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis: Transfer the *Sample* to a 600-mL beaker. Dissolve in 200 mL of water, stirring by mechanical means for NLT 30 min. Titrate with 0.1 N sodium hydroxide VS to a pH of 7.0.

Calculate the weight, in g, of free carboxyl groups in the *Sample* taken:

$$\text{Result} = [(V \times M_r \times N)/W] \times F$$

V = *Titrant* volume consumed (mL)

M_r = mEq of CO_2 , 44 mg/mEq

N = actual normality of the *Titrant* (mEq/mL)

W = *Sample* weight (g)

F = conversion factor, 10^{-3} g/mg

Acceptance criteria: The weight of free carboxyl groups found, calculated on the dried basis, is NMT 35% of the weight of carbon dioxide yielded by an equal weight of specimen in the *Assay*.

• **ESTERIFIED CARBOXYL GROUPS**

Sample solution: The solution obtained in the test for *Free Carboxyl Groups*

Analysis: Transfer the *Sample solution* with the aid of water to a 1000-mL conical flask. Add phenolphthalein TS and 50.0 mL of 0.1 N sodium hydroxide VS, insert a stopper in the flask, mix, and allow to stand for 30 min at ambient temperature. Titrate the excess sodium hydroxide with 0.1 N hydrochloric acid VS to a faint pink endpoint. Transfer the solution with the aid of water to a 600-mL beaker, and complete the titration to a pH of 7.0, determining the endpoint potentiometrically.

Calculate the weight, in g, of esterified carboxyl groups in the weight, W , in g, of the specimen taken:

$$\text{Result} = [(V \times M_r \times N)/W] \times F$$

V = volume of 0.1 N sodium hydroxide consumed (mL)

M_r = mEq of CO_2 , 44 mg/mEq

N = actual normality of 0.1 N sodium hydroxide (mEq/mL)

W = specimen weight (g)

F = conversion factor, 10^{-3} g/mg

Acceptance criteria: The weight of esterified carboxyl groups found, calculated on the dried basis, is 40%–85% of the weight of carbon dioxide yielded by an equal weight of specimen in the *Assay*.

IMPURITIES

• **ARSENIC**, *Method II* (211): 3 ppm

• **HEAVY METALS**, *Method II* (231): NMT 40 ppm, using a platinum crucible for the ignition, and nitric acid being used in place of sulfuric acid to wet the sample specimen

• **LEAD** (251)

Standard solution: 5 mL of *Diluted Standard Lead Solution*

Test preparation: Add 1.0 g to 20 mL of nitric acid in a 250-mL conical flask, mix, and heat carefully until the specimen is dissolved. Continue the heating until the volume is reduced to 7 mL. Cool rapidly to room temperature, transfer to a 100-mL volumetric flask, dilute with water to volume, and mix. Use a 50-mL portion.

Analysis: Proceed as directed in the chapter, using 15 mL of ammonium citrate solution, 3 mL of potassium cyanide solution, and 0.5 mL of hydroxylamine hydrochloride solution for the test. After the first dithizone extractions, wash the combined chloroform layers with 5 mL of water, discarding the water layer and continuing in the usual manner by extracting with 20 mL of 0.2 N nitric acid.

Acceptance criteria: A 50.0-mL portion of this solution contains NMT 5 µg of lead (corresponding to NMT 10 ppm of Pb).

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total bacterial count does not exceed 200 cfu/g, and the tests for *Salmonella* species and *Escherichia coli* are negative.

• **LOSS ON DRYING** (731): Dry a sample at 105° for 4 h: it loses NMT 20.0% of its weight.

• **ASH**

Sample: 3 g

Analysis: Weigh the *Sample* in a tared crucible, and incinerate at $650 \pm 25^\circ$ until free from carbon. Cool in a desiccator, weigh, and determine the weight of the ash.

Acceptance criteria: NMT 10.0% on the dried basis

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Propylene Glycol Dicaprylate/Dicaprate

Decanoic acid, mixed diesters with octanoic acid and propylene glycol [68583-51-7].

DEFINITION

Propylene Glycol Dicaprylate/Dicaprate is a mixture of the propylene glycol mono- and diesters of caprylic acid ($C_8H_{16}O_2$) and capric acid ($C_{10}H_{20}O_2$), the diesters fraction being predominant.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197F)

• **B. THIN-LAYER CHROMATOGRAPHY IDENTIFICATION TEST** (201)

Standard solution: 50 mg/mL of USP Propylene Glycol Dicaprylate/Dicaprate RS in methylene chloride

Sample solution: 50 mg/mL of Propylene Glycol Dicaprylate/Dicaprate in methylene chloride

Application volume: 10 μ L, as streaks

Developing solvent system: Ether and hexane (7:3)

Spray reagent: 0.1 mg/mL of rhodamine 6G in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram over a path of 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.

Acceptance criteria: The R_f values of the principal spots from the *Sample solution* correspond to those from the *Standard solution*.

- **C.** It meets the requirements of the test for *Fats and Fixed Oils* <401>, *Fatty Acid Composition*.

IMPURITIES

Inorganic Impurities

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>: NMT 0.1%

ALKALINE IMPURITIES

Sample: 2.0 g of Propylene Glycol Dicaprylate/Dicaprate

Analysis: Dissolve the *Sample* in a mixture of 1.5 mL of alcohol and 3.0 mL of ether. Add 0.05 mL of bromophenol blue TS.

Acceptance criteria: NMT 0.15 mL of 0.01 N hydrochloric acid is required in order to change the color of the indicator to yellow.

SPECIFIC TESTS

- **FATS AND FIXED OILS, Acid Value** <401>: NMT 0.2
- **FATS AND FIXED OILS, Fatty Acid Composition** <401>: Propylene Glycol Dicaprylate/Dicaprate exhibits the composition profile of fatty acids shown in the following table:

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
6	0	≤ 2.0
8	0	50.0–80.0
10	0	20.0–50.0
12	0	≤ 3.0
14	0	≤ 1.0

- **FATS AND FIXED OILS, Hydroxyl Value** <401>: NMT 10
- **FATS AND FIXED OILS, Iodine Value** <401>: NMT 1.0
- **FATS AND FIXED OILS, Peroxide Value** <401>: NMT 1.0
- **FATS AND FIXED OILS, Saponification Value** <401>: 320–340
- **FATS AND FIXED OILS, Unsaponifiable Matter** <401>: NMT 0.5%, determined on 5.0 g
- **WATER DETERMINATION, Method Ia** <921>: NMT 0.1%, using a mixture of methanol and methylene chloride (1:1) in place of methanol in the titration vessel

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and protect from moisture. No storage requirements specified.
- **USP REFERENCE STANDARDS** <11>
USP Propylene Glycol Dicaprylate/Dicaprate RS

Propylene Glycol Dilaurate

$C_{27}H_{52}O_4$

Lauric acid, diester with propane-1,2-diol;
Propane-1,2-diyl didodecanoate
[22788-19-8].

440.70

DEFINITION

Propylene Glycol Dilaurate is a mixture of the propylene glycol mono- and diesters of lauric acid. It contains NLT 70.0% of diesters and NMT 30.0% of monoesters.

IDENTIFICATION

A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>

Standard solution: 50 mg/mL of USP Propylene Glycol Dilaurate RS in methylene chloride

Sample solution: 50 mg/mL of Propylene Glycol Dilaurate in methylene chloride

Developing solvent system: Hexane and ether (3:7)

Spray reagent: 0.1 mg/mL of rhodamine 6G in alcohol

Analysis: Apply 200 μ g of the *Standard solution* and *Sample solution*. Develop the chromatogram over a path of 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.

Acceptance criteria: The R_f values of the principal spots of the *Sample solution* correspond to those of the *Standard solution*.

- **B. FATS AND FIXED OILS, Fatty Acid Composition** <401>:
Meets the requirements

ASSAY

PROCEDURE

Mobile phase: Tetrahydrofuran

Sample solution: 200 mg of Propylene Glycol Dilaurate in 5 mL of tetrahydrofuran

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7-mm \times 60-cm; 5- μ m packing L21 (100Å)

[NOTE—Two 7-mm \times 30-cm L21 columns may be used in place of one 60-cm column, provided system suitability requirements are met.]

Temperature

Column: 40°

Detector: 40°

Flow rate: 1 mL/min

Injection size: 40 μ L

System suitability

Sample: *Sample solution*

[NOTE—Elution order: diesters, monoesters, propylene glycol.]

Suitability requirements

Relative standard deviation: NMT 1.0% is determined from the monoester peak.

Analysis

Sample: *Sample solution*

Calculate the percentage of monoesters or diesters in the portion of Propylene Glycol Dilaurate taken:

$$\text{Result} = (r_U/r_T) \times (100 - D)$$

r_U = peak response for monoesters or diesters

r_T = sum of the responses of the monoester and diester peaks

D = sum of the percentage content of propylene glycol and the percentage content of free fatty acids

Calculate the percentage content of free fatty acids:

$$\text{Result} = (A/561.1) \times 200$$

A = acid value

Acceptance criteria: NLT 70.0% of diesters and NMT 30.0% of monoesters

IMPURITIES**Inorganic Impurities**

- **USP REFERENCE STANDARDS** (11)
USP Propylene Glycol RS
USP Propylene Glycol Dilaurate RS

Propylene Glycol Monocaprylate

Propylene glycol mono-octanoate;
Octanoic acid, monoester with 1,2-propane diol;
Caprylic acid, monoester with propane-1,2-diol
[31565-12-5].

DEFINITION

Propylene Glycol Monocaprylate is a mixture of the propylene glycol monoesters and diesters of fatty acids composed predominately of caprylic acid. The requirements for monoester and diester content differ for the two types of Propylene Glycol Monocaprylate, as shown in the table below.

	Content of Monoesters (%)		Content of Diesters (%)	
	Min.	Max.	Min.	Max.
Type I	55.0	80.0	20.0	45.0
Type II	90.0	—	—	10.0

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197A)
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)
Standard solution: 50 mg/mL of USP Propylene Glycol Monocaprylate Type I RS or USP Propylene Glycol Monocaprylate Type II RS in methylene chloride
Sample solution: 50 mg/mL in methylene chloride
Chromatographic system
Application volume: 10 µL
Developing solvent system: Ether and hexane (70:30)
Spray reagent: 0.1 mg/mL of rhodamine 6G in alcohol
Analysis: Develop the chromatogram over a path of 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.
Acceptance criteria: The *R_f* values of the principal spots from the *Sample solution* correspond to those from the *Standard solution*.
- **C.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* (401).

ASSAY**PROCEDURE**

Mobile phase: Tetrahydrofuran

Sample solution: 40 mg/mL of Propylene Glycol Monocaprylate in tetrahydrofuran

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7-mm × 60-cm; 5-µm packing L21 (100 Å).

[NOTE—Two 7-mm × 30-cm L21 columns may be used in place of one 60-cm column, provided *System suitability* requirements are met.]

Temperatures

Column: 40°

Detector: 40°

Flow rate: 1 mL/min

Injection volume: 40 µL

System suitability

Sample: *Sample solution*

[NOTE—The relative retention times with reference to propylene glycol for diesters and monoesters are about 0.85 and 0.90, respectively.]

Suitability requirements

Relative standard deviation: NMT 2.0% for the monoester peak

Analysis

Sample: *Sample solution*

Calculate the percentage of monoesters or diesters in the portion of Propylene Glycol Monocaprylate taken:

$$\text{Result} = (r_u/r_t) \times (100 - D)$$

r_u = peak response for monoesters or diesters

r_t = sum of the peak responses of the monoesters and diesters

D = sum of the percentage content of propylene glycol and the percentage content of free fatty acids

Calculate the percentage content of free fatty acids:

$$\text{Result} = (A/561.1) \times 144$$

A = acid value

Acceptance criteria**Type I**

Monoesters: 55.0%–80.0%

Diesters: 20.0%–45.0%

Type II

Monoesters: NLT 90.0%

Diesters: NMT 10.0%

IMPURITIES

- **HEAVY METALS**, *Method II* <231>: NMT 10 µg/g

- **LIMIT OF PROPYLENE GLYCOL**

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard stock solution: 4 mg/mL of USP Propylene Glycol RS in tetrahydrofuran

Standard solutions: Into four 5-mL volumetric flasks, introduce respectively 0.25, 0.5, 1.0, and 2.5 mL of *Standard stock solution*, and dilute with tetrahydrofuran to volume. In a fifth 5-mL volumetric flask, introduce 5.0 mL of *Standard stock solution*.

Analysis

Samples: *Standard solutions* and *Sample solution*

Prepare a standard curve of peak area versus concentration, in mg/mL, of propylene glycol in the *Standard solutions*. Obtain the concentration of propylene glycol in the *Sample solution* from the standard curve.

Calculate the percentage of free propylene glycol in the portion of Propylene Glycol Monocaprylate taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of propylene glycol in the *Sample solution* from the standard curve

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria

Propylene glycol monocaprylate (Type I): NMT 1.5%

Propylene glycol monocaprylate (Type II): NMT 1.5%

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Acid Value* <401>: NMT 1.5
- **FATS AND FIXED OILS**, *Fatty Acid Composition* <401>: Propylene Glycol Monocaprylate exhibits the composition profile of fatty acids shown in *Table 1*.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
8	0	≥90.0
10	0	≤3.0
12	0	≤3.0
14	0	≤3.0
16	0	≤1.0

- **FATS AND FIXED OILS**, *Iodine Value* <401>: NMT 1.0
- **FATS AND FIXED OILS**, *Saponification Value* <401>: Propylene glycol monocaprylate (Type I): 285–315
Propylene glycol monocaprylate (Type II): 270–295
- **FATS AND FIXED OILS**, *Peroxide Value* <401>: NMT 6.0
- **WATER DETERMINATION**, *Method Ia* <921>: **Analysis:** Use a mixture of methanol and methylene chloride (1:1) in place of methanol in the titration vessel.
Acceptance criteria: NMT 1.0%
- **ARTICLES OF BOTANICAL ORIGIN**, *Total Ash* <561>: NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and protect from moisture. No storage requirements specified.

- **LABELING:** Label it to indicate the type (Type I or Type II).
- **USP REFERENCE STANDARDS** <11>: USP Propylene Glycol RS
USP Propylene Glycol Monocaprylate Type I RS
USP Propylene Glycol Monocaprylate Type II RS

Propylene Glycol Monolaurate

Dodecanoic acid, monoester with 1,2-propanediol;
Lauric acid, monoester with propane-1,2-diol.

DEFINITION

Propylene Glycol Monolaurate is a mixture of the propylene glycol mono- and diesters of lauric acid. The requirements for monoester and diester content differ for the two types of Propylene Glycol Monolaurate, as set forth in the table below.

	Content of Monoesters (%)		Content of Diesters (%)	
	Min.	Max.	Min.	Max.
Type I	45.0	70.0	30.0	55.0
Type II	90.0	—	—	10.0

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>

Standard solution: 50 mg/mL of USP Propylene Glycol Monolaurate Type I RS (or USP Propylene Glycol Monolaurate Type II RS) in methylene chloride

Sample solution: 50 mg/mL in methylene chloride

Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

Developing solvent system: Ether and hexane (70:30)

Spray reagent: 0.1 mg/mL of rhodamine 6G in alcohol

Analysis: Develop the chromatogram over a path of 15 cm, and dry the plate in a current of air. Spray the plate with *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.

Acceptance criteria: The *R_f* values of the principal spots from the *Sample solution* correspond to those from the *Standard solution*.

- **B.** It meets the requirements in *Specific Tests for Fats and Fixed Oils*, *Fatty Acid Composition* <401>.

ASSAY

Sample: *Sample solution*

Suitability requirements

[NOTE—The order of elution is diesters, monoesters, and propylene glycol.]

Relative standard deviation: NMT 1.0% for the monoester peak

Analysis

Sample: *Sample solution*

Calculate the percentage of monoesters or diesters in the portion of Propylene Glycol Monolaurate taken:

$$\text{Result} = (r_U/r_T) \times (100 - D)$$

r_U = peak response for monoesters or diesters
 r_T = sum of the peak responses of the monoesters and diesters
 D = sum of the percentage content of propylene glycol and the percentage content of free fatty acids

Calculate the percentage content of free fatty acids in the portion taken:

$$\text{Result} = (A/561.1) \times 200$$

A = acid value

Acceptance criteria

Type I

Monoesters: 45.0%–70.0%

Diesters: 30.0%–55.0%

Type II

Monoesters: NLT 90.0%

Diesters: NMT 10.0%

IMPURITIES

• LIMIT OF PROPYLENE GLYCOL

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard stock solution: 4 mg/mL of USP Propylene Glycol RS in tetrahydrofuran

Standard solutions: Into four 15-mL flasks introduce, respectively, 0.25, 0.5, 1.0, and 2.5 mL of *Standard stock solution*, and dilute with tetrahydrofuran to 5.0 mL. In a fifth 15-mL flask, introduce 5.0 mL of *Standard stock solution*.

Analysis

Samples: *Standard solutions* and *Sample solution*
 Prepare a standard curve of peak area versus concentration, in mg/mL, of propylene glycol in the *Standard solutions*. Obtain the concentration of propylene glycol in the *Sample solution* from the standard curve.

Calculate the percentage of free propylene glycol in the portion of Propylene Glycol Monocaprylate taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of propylene glycol in the *Sample solution* from the standard curve

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria

Propylene glycol monolaurate (Type I): NMT 5.0%

Propylene glycol monolaurate (Type II): NMT 1.0%

SPECIFIC TESTS

• FATS AND FIXED OILS, Acid Value (401): NMT 4

• FATS AND FIXED OILS, Fatty Acid Composition (401):

Propylene Glycol Monolaurate exhibits the composition profile of fatty acids shown in *Table 1*.

Table 1

Fatty Acids	Carbon-Chain Length	Percentage (%)
Caprylic acid	C8	NMT 0.5
Capric acid	C10	NMT 2.0
Lauric acid	C12	NLT 95.0
Myristic acid	C14	NMT 3.0
Palmitic acid	C16	NMT 1.0

• FATS AND FIXED OILS, Iodine Value (401): NMT 1

• FATS AND FIXED OILS, Saponification Value (401)

Propylene glycol monolaurate (Type I): 210–245

Propylene glycol monolaurate (Type II): 200–230

• WATER DETERMINATION, Method Ia (921)

Analysis: Use a mixture of methanol and methylene chloride (1:1) in place of methanol in the titration vessel.

Acceptance criteria: NMT 1.0%

• ARTICLES OF BOTANICAL ORIGIN, Total Ash (561): NMT 0.1%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and protect from moisture. No storage requirements specified.

• **LABELING:** Label it to indicate the type (Type I or Type II).

• USP REFERENCE STANDARDS (11)

USP Propylene Glycol RS

USP Propylene Glycol Monolaurate Type I RS

USP Propylene Glycol Monolaurate Type II RS

Propylene Glycol Monostearate

Octadecanoic acid, monoester with 1,2-propanediol; 1,2-Propanediol monostearate [1323-39-3].

DEFINITION

Propylene Glycol Monostearate is a mixture of the propylene glycol mono- and di-esters of stearic and palmitic acids. It contains NLT 90.0% of monoesters of saturated fatty acids, chiefly propylene glycol monostearate ($C_{21}H_{42}O_3$) and propylene glycol monopalmitate ($C_{19}H_{38}O_3$).

ASSAY

• PROPYLENE GLYCOL MONOESTERS

Sample: 25 g

Analysis: Place the *Sample* in a 500-mL, round-bottom flask, and add 250 mL of alcohol and 7.5 g of potassium hydroxide. Connect the flask to a suitable condenser, reflux the mixture for 2 h, cool, and transfer to an 800-mL beaker, rinsing the flask with 100 mL of water and combining the rinsing with the mixture in the beaker. Heat on a steam bath to evaporate the alcohol, adding water occasionally to replace the alcohol, and continue the evaporation until the odor of alcohol can no longer be detected. Adjust the volume, with hot water, to 250 mL, neutralize with a mixture of equal volumes of sulfuric acid and water, noting the volume used, and add a 10% excess of the dilute acid. Heat with stirring until the fatty acid layer separates, and transfer the fatty acids to a 500-mL separator. Wash the fatty acids with four 200-mL portions of hot water, and discard the washings. Dry the fatty acids at 105° for 1 h, cool, and determine the acid value on a 1-g portion, as directed in *Fats and Fixed Oils* (401), *Acid Value* (*Free Fatty Acids*).

Calculate the average molecular weight of the monoesters, in the portion of Propylene Glycol Monostearate taken:

$$M_{rAvg} = (M_{r1}/A) + M_{r2} - M_{r3}$$

M_{r1} = 1000 times the molecular weight of potassium hydroxide, 56,110

A = acid value

M_{r2} = molecular weight of propylene glycol, 76.10

M_{r3} = molecular weight of water, 18.02

Calculate F in the portion taken:

$$F = (M_{r4} \times G)/M_{r5}$$

- M_{r4} = 10 times the molecular weight of potassium hydroxide, 561.1
 G = content, in percentage, of glycerin and propylene glycol in propylene glycol monostearate
 M_{r5} = one-half of the molecular weight of propylene glycol, 38.05
 Calculate the percentage of propylene glycol monoesters:

$$\text{Result} = [(H - F) \times M_{r\text{Avg}}]/M_{r4}$$

- H = hydroxyl value of propylene glycol monostearate

Acceptance criteria: NLT 90.0% of monoesters of saturated fatty acids, chiefly propylene glycol monostearate and propylene glycol monopalmitate

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%
- **FREE GLYCERIN AND PROPYLENE GLYCOL**

Periodic acid solution: Dissolve 5.4 g of periodic acid in 100 mL of water, and add 1900 mL of glacial acetic acid. Store in a glass-stoppered bottle, protected from light.

Chloroform: Use chloroform that meets the following additional requirement. To each of three glass-stoppered, 500-mL conical flasks add 50.0 mL of *Periodic acid solution*, then add 50 mL of chloroform and 10 mL of water to two of the flasks and 50 mL of water to the third flask. To each flask add 20 mL of potassium iodide TS, mix gently, and proceed as directed for *Analysis*, beginning with "allow to stand for 1–5 min". The difference between the volumes of 0.1 N sodium thiosulfate required in the titrations with and without the chloroform does not exceed 100 μ L.

Sample solution: Melt the Propylene Glycol Monostearate at a temperature NMT 55°. Transfer a 3-g portion to a 100-mL beaker, and dissolve in 25 mL of *Chloroform*.

Analysis: Transfer the *Sample solution*, with the aid of another 25-mL portion of *Chloroform*, to a separator, wash the beaker with 25 mL of water, and add the washing to the separator. Insert the stopper, shake vigorously for 30–60 s, and allow the layers to separate, adding 1–2 mL of glacial acetic acid, if necessary, to break any emulsion. Transfer the aqueous layer to a glass-stoppered, 500-mL conical flask, wash the chloroform layer with two 25-mL portions of water, combining the washings with the aqueous layer, and discard the chloroform layer. Add, with swirling, 50.0 mL of *Periodic acid solution* to the solution and to another glass-stoppered, 500-mL conical flask containing 75 mL of water to provide the blank. Allow to stand for 30–90 min. To each flask add 20 mL of potassium iodide TS, mix gently, and allow to stand for 1–5 min before titrating. Add 100 mL of water, and titrate with 0.1 N sodium thiosulfate VS until the brown iodine color fades to pale yellow, add 3 mL of starch TS, and continue the titration to the disappearance of the blue color.

Calculate the percentage of free glycerin and propylene glycol, calculated as propylene glycol, in the portion of Propylene Glycol Monostearate taken:

$$\text{Result} = [(V_B - V_S) \times M_r \times N]/W$$

- V_B = volume of sodium thiosulfate consumed by the blank solution (mL)
 V_S = volume of sodium thiosulfate consumed by the *Sample solution* (mL)
 M_r = molecular weight of propylene glycol divided by 20, 3.805
 N = actual normality of the sodium thiosulfate solution

- W = weight of Propylene Glycol Monostearate taken (g)

Acceptance criteria: NMT 1.0% free glycerin and propylene glycol, calculated as propylene glycol

SPECIFIC TESTS

- **CONGEALING TEMPERATURE** (651): NLT 45°
- **FATS AND FIXED OILS**, *Acid Value* (Free Fatty Acids) (401): NMT 4
- **FATS AND FIXED OILS**, *Hydroxyl Value* (401): 160–175
- **FATS AND FIXED OILS**, *Iodine Value* (401): NMT 3
- **FATS AND FIXED OILS**, *Saponification Value* (401): 155–165

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Propylparaben

$C_{10}H_{12}O_3$ 180.20
 Benzoic acid, 4-hydroxy-, propyl ester;
 Propyl *p*-hydroxybenzoate [94-13-3].

DEFINITION

Propylparaben contains NLT 98.0% and NMT 102.0% of $C_{10}H_{12}O_3$.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B. MELTING RANGE OR TEMPERATURE** (741): 96°–99°

ASSAY

PROCEDURE

Mobile phase, Sample solution, Standard solution B, and Chromatographic system: Proceed as described in the procedure for *Related Substances*.

System suitability

Sample: *Standard solution B*

Suitability requirements

Relative standard deviation: NMT 0.85% for 6 injections

Analysis

Samples: *Sample solution* and *Standard solution B*
 Calculate the percentage of Propylparaben in the *Sample solution*:

$$\text{Result} = P \times (r_U \times C_S)/(r_S \times C_U)$$

- P = labeled purity of USP Propylparaben RS expressed as a percentage
 r_U = peak area of propylparaben from the *Sample solution*
 C_S = concentration of propylparaben in *Standard solution B*
 r_S = peak area of propylparaben from *Standard solution B*
 C_U = concentration of Propylparaben in the *Sample solution*

Acceptance criteria: 98.0%–102.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%, determined on 1.0 g

Organic Impurities**• PROCEDURE: RELATED SUBSTANCES**

Mobile phase: Methanol and a 6.8 g/L solution of potassium dihydrogen phosphate (65:35 v/v)

Sample solution: Dissolve 50.0 mg of Propylparaben in 2.5 mL of methanol, and dilute with *Mobile phase* to 50.0 mL. Dilute 10.0 mL of this solution with *Mobile phase* to 100.0 mL.

Standard solution A: 5.0 µg/mL each of *p*-hydroxybenzoic acid, USP Ethylparaben RS, and USP Propylparaben RS in *Mobile phase*

Standard solution B: Dissolve 50.0 mg of USP Propylparaben RS in 2.5 mL of methanol, and dilute with *Mobile phase* to 50.0 mL. Dilute 10.0 mL of this solution with *Mobile phase* to 100.0 mL.

Standard solution C: Dilute 1.0 mL of the *Sample solution* with *Mobile phase* to 20.0 mL. Dilute 1.0 mL of this solution with *Mobile phase* to 10.0 mL.

Chromatographic system

(See Chromatography <621>, *System Suitability*.)

Mode: LC

Detector: UV 272 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.3 mL/min

Injection size: 10 µL

Run time: About 2.5 times the retention time of propylparaben

System suitability

Sample: *Standard solution A*

[NOTE—The retention time of propylparaben is about 4.5 min; the relative retention times for *p*-hydroxybenzoic acid and ethylparaben are about 0.3 and 0.7, respectively.]

Suitability requirements

Resolution: NLT 3.0 between the ethylparaben and propylparaben peaks

Analysis

Samples: *Sample solution* and *Standard solution C*

[NOTE—Disregard any limit that is 0.2 times the area of the principal peak in the chromatogram obtained with *Standard solution C* (0.1%).]

Acceptance criteria

***p*-Hydroxybenzoic acid:** The peak area in the *Sample solution*, multiplied by 1.4 to correct for the calculation of content, is NMT the area of the principal peak in *Standard solution C* (0.5%).

Unspecified impurities: The peak area of each impurity in the *Sample solution* is NMT the area of the principal peak in *Standard solution C* (0.5%).

Total impurities: The total peak area for all impurities in the *Sample solution* is NMT twice the area of the principal peak in *Standard solution C* (1.0%).

SPECIFIC TESTS**• COLOR OF SOLUTION**

Sample solution: 100 mg/mL in alcohol

Comparison solution: Mix 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, and 0.4 mL of cupric sulfate CS with 0.3 N hydrochloric acid to make 10 mL. Dilute 5 mL of this solution with 0.3 N hydrochloric acid to make 100 mL. [NOTE—Prepare and use this solution immediately.]

Analysis

Samples: Alcohol, *Sample solution*, and *Comparison solution*

Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* <631>).

Acceptance criteria: The *Sample solution* is clear and not more intensely colored than alcohol or the *Comparison solution*.

• ACIDITY

Sample solution: To 2 mL of *Sample solution* prepared in the test for *Color of Solution*, add 3 mL of alcohol,

5 mL of carbon dioxide-free water, and 0.1 mL of bromocresol green TS.

Analysis: Titrate with 0.10 N sodium hydroxide.

Acceptance criteria: NMT 0.1 mL is required to produce a blue color.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** <11>

USP Ethylparaben RS

USP Propylparaben RS

Propylparaben Sodium

DEFINITION

Propylparaben Sodium contains NLT 98.5% and NMT 101.5% of propylparaben sodium (C₁₀H₁₁NaO₃), calculated on the anhydrous basis.

IDENTIFICATION**• A.**

Standard: 0.5 g of USP Propylparaben RS

Sample: 0.5 g

Analysis: Dissolve the *Sample* in 5 mL of water. Acidify with hydrochloric acid, and filter the resulting precipitate. Wash the precipitate with water, and dry over silica gel for 5 h. Repeat with the *Standard*.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the *Sample* exhibits maxima only at the same wavelengths as that of a mineral oil dispersion of the *Standard*.

• B.

Sample solution: Ignite 0.3 g of Propylparaben Sodium, cool, and dissolve the residue in 3 mL of 3 N hydrochloric acid.

Acceptance criteria: A platinum wire dipped in the *Sample solution* imparts an intense, persistent yellow color to a nonluminous flame.

ASSAY**• PROCEDURE**

Potassium bromate solution: 5.56 mg/mL

Potassium bromide solution: 125 mg/mL

Sample: 100 mg

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: Potassium iodide TS

Back-titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Gently reflux 100 mg with 30 mL of 1 N sodium hydroxide for 30 min. Cool; add 25.0 mL of *Potassium bromate solution*, 5 mL of *Potassium bromide solution*, and 10 mL of hydrochloric acid; and immediately insert the stopper into the flask. Cool, shake for 15 min, and allow to stand for 15 min. Quickly add 15 mL of *Titrant*, taking care to avoid the escape of bromine vapor. At once replace the stopper in the flask, and shake vigorously. Rinse the stopper and the neck of the flask with a small quantity of water. Titrate the liberated iodine with *Back-titrant*, adding 3 mL of starch TS as the endpoint is approached. [NOTE—About 15 mL is needed.] Perform a blank determination, and note the difference in volumes required. Each mL of the difference in volume of 0.1 N sodium thiosulfate is equivalent to 3.37 mg of propylparaben sodium (C₁₀H₁₁NaO₃).

Acceptance criteria: 98.5%–101.5% on the anhydrous basis

IMPURITIES

- **CHLORIDE AND SULFATE**, *Chloride* (221)
Standard solution: 0.10 mL of 0.020 N hydrochloric acid
Sample: 0.2 g
Analysis: Proceed as directed in the chapter.
Acceptance criteria: 0.035%; the *Sample* shows no more chloride than the *Standard solution*.
- **CHLORIDE AND SULFATE**, *Sulfate* (221)
Standard solution: 0.30 mL of 0.020 N sulfuric acid
Sample: 0.25 g
Analysis: Proceed as directed in the chapter.
Acceptance criteria: 0.12%; the *Sample* shows no more sulfate than the *Standard solution*.

SPECIFIC TESTS

- **pH** (791)
Sample solution: 1 mg/mL
Acceptance criteria: 9.5–10.5
- **WATER DETERMINATION**, *Method I* (921): NMT 5.0%
- **COMPLETENESS OF SOLUTION** (641)
Sample solution: Dissolve 1 g in water.
Acceptance criteria: Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
USP Propylparaben RS

Protamine Sulfate—see *Protamine Sulfate General Monographs***Pullulan**

Poly[6]- α -D-glucopyranosyl-(1 \rightarrow 4)- α -D-glucopyranosyl-(1 \rightarrow 4)- α -D-glucopyranosyl-(1 \rightarrow) [9057-02-7].

DEFINITION

Pullulan is a neutral, simple polysaccharide produced by the growth of *Aureobasidium pullulans*. It has a chain structure of repeated α -1,6-bonds of maltotriose composed of three glucoses in α -1,4-bonds. It may contain some maltotetraosyl units. It contains NLT 90% of glucan, calculated on the dried basis.

IDENTIFICATION

- **A.**
Sample: 10 g
Analysis: Dissolve the *Sample* in 100 mL of water by adding in small portions with stirring.
Acceptance criteria: A viscous solution is produced.
- **B.**
Pullulanase sample solution: 10 units/mL of pullulanase
Sample solution: The viscous solution obtained in *Identification test A*
Analysis: Mix 10 mL of the *Sample solution* with 0.1 mL of *Pullulanase sample solution*, and allow to incubate at 25° for 20 min.

Acceptance criteria: A substantial loss of viscosity is observed.

- **C.**
Sample solution: 20 mg/mL
Analysis: To 10 mL of the *Sample solution* add 2 mL of polyethylene glycol 600.
Acceptance criteria: A white precipitate is formed immediately.

ASSAY

- **CONTENT OF MONOSACCHARIDE, DISACCHARIDE, AND OLIGOSACCHARIDES**

Sample stock solution: 8 mg/mL, on previously dried material

Sample solution: To 1.0 mL of the *Sample stock solution* add 0.1 mL of saturated potassium chloride solution, and shake vigorously with 3 mL of methyl alcohol. Centrifuge, and use the supernatant.

Standard solution: Dilute 1.0 mL of the *Sample stock solution* with water to 50 mL.

Blank: Water

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Vis

Analytical wavelength: 620 nm

Analysis

Samples: *Sample solution*, *Standard solution*, and *Blank*
Transfer 0.2 mL each of the *Standard solution*, *Sample solution*, and *Blank* to a test tube containing 5 mL of a 1-in-500 solution of anthrone in 75% (v/v) sulfuric acid, with the test tube placed in ice water. Mix each tube immediately, and then heat the test tube at 90° for 10 min. Remove the tube, and allow it to cool in cold running water.

Determine the absorbances of the resulting solutions at the specified wavelength.

Determine the percentage of monosaccharide, disaccharide, and oligosaccharides in the portion of the sample taken:

$$\text{Result} = (D_U/D_S) \times (A_U - A_B)/(A_S - A_B) \times 100$$

D_U = dilution factor for the *Sample solution*, 4.1
 D_S = dilution factor for the *Standard solution*, 50
 A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 A_B = absorbance of the *Blank*

Acceptance criteria: The total content of monosaccharide, disaccharide, and oligosaccharides is NMT 10.0%, corresponding to NLT 90% of glucan on the dried basis.

IMPURITIES

- **RESIDUE ON IGNITION** (281)
Sample: 2.0 g
Acceptance criteria: NMT 0.3%
- **HEAVY METALS**, *Method II* (231): NMT 5 μ g/g
- **NITROGEN DETERMINATION**, *Method II* (461)
Sample: 3 g, previously dried
Analysis: Proceed as directed in the chapter, replacing the 7 mL of sulfuric acid with 12 mL of sulfuric acid for the decomposition and replacing the 30 mL of sodium hydroxide solution (2 in 5) with 40 mL of a solution of sodium hydroxide (2 in 5).
Acceptance criteria: NMT 0.05%

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10^2 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g.

- **pH** <791>
Sample: 1.0 g
Analysis: Dissolve the *Sample* in 10 mL of freshly boiled and cooled water.
Acceptance criteria: 4.5–6.5
- **LOSS ON DRYING** <731>
Analysis: Dry at 90° under vacuum for 6 h.
Acceptance criteria: NMT 6.0%
- **VISCOSITY—CAPILLARY VISCOMETER METHODS** <911>
Sample: Exactly 10.0 g, previously dried
Analysis: Dissolve the *Sample* in water to make exactly 100 g, and perform the test at 30 ± 0.1° using a Ubbelohde-type viscometer.
Acceptance criteria: The kinematic viscosity is 100–180 mm² · s⁻¹.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.
- **LABELING:** Label it to indicate the viscosity, giving the type of viscosity parameter, concentration of the solution, and the type of equipment used.

Pumice—see *Pumice General Monographs*

Racemethionine

C₅H₁₁NO₂S 149.21
 Methionine, DL-;
 DL-2-Amino-4-(methylthio)-butyric acid [59-51-8].

DEFINITION

Racemethionine contains NLT 99.0% and NMT 101.0% of C₅H₁₁NO₂S, as DL-methionine, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
Sample: Dry the substances at 105°.
Acceptance criteria: Meets the requirements
- **B.** The principal spot from *Sample solution B* is similar in size, color, and position to the principal spot from *Standard solution A*, as obtained in the test for *Organic Impurities, Related Substances*.
- **C. OPTICAL ROTATION, Angular Rotation** <781A>
Sample: 50 mg/mL in 1 M hydrochloric acid
Acceptance criteria: -0.05° to +0.05°
- **D. PROCEDURE**
Analysis: Dissolve 0.1 g of Racemethionine and 0.1 g of glycine in 4.5 mL of dilute sodium hydroxide solution (85 mg/mL). Add 1 mL of sodium nitroferricyanide solution (25 mg/mL). Heat to 40° for 10 min. Allow to cool, and add 2 mL of a mixture of hydrochloric acid and phosphoric acid (90:10).
Acceptance criteria: A deep red color develops.

ASSAY

- **PROCEDURE**
Sample: 140 mg of Racemethionine
Analysis: Dissolve the *Sample* in a mixture of 3 mL of formic acid and 50 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary corrections (see *Titrimetry* <541>).

Each mL of 0.1 N perchloric acid is equivalent to 14.92 mg of C₅H₁₁NO₂S.

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 0.1%, determined on 1.0 g
- **CHLORIDE AND SULFATE, Chloride** <221>: [NOTE—Prepare the *Sample solution* and the *Standard solution* at the same time.]
Chloride standard solution (5 ppm Cl): 0.824 mg/mL of NaCl. Just before use, dilute 1 mL of this solution with water to 100 mL.
Standard solution: To 10 mL of *Chloride standard solution* add 10 mL of 0.1 N silver nitrate and 25 mL of water, and mix.
Sample solution: Dissolve 0.25 g in 35 mL of water. Add 5 mL of dilute nitric acid and 10 mL of 0.1 N silver nitrate. Allow to stand protected from light for 5 min.
Analysis: Examine the *Sample solution* and *Standard solution* laterally against a black background.
Acceptance criteria: Any opalescence in the *Sample solution* is not more intense than that in the *Standard solution* (200 ppm).
- **CHLORIDE AND SULFATE, Sulfate** <221>: [NOTE—Prepare the *Sample solution* and the *Control solution* at the same time.]
Barium chloride solution: 250 mg/mL
Sulfate standard solution (10 ppm SO₄): 1.81 mg/mL of potassium sulfate in 30% alcohol (v/v). Just before use, dilute 1 mL of this solution with 30% alcohol (v/v) to 100 mL.
Standard solution: Mix 3 mL of the *Barium chloride solution* and 4.5 mL of the *Sulfate standard solution*, and allow to stand for 1 min.
Sample stock solution: 50.0 mg/mL, heated to 60°. Cool to 10°, and filter.
Sample solution: To 2.5 mL of the *Standard solution* add 15 mL of the *Sample stock solution* and 0.5 mL of 5 N acetic acid.
Control solution: To 2.5 mL of the *Standard solution* add 15 mL of the *Sulfate standard solution* and 0.5 mL of 5 N acetic acid.
Analysis
Samples: *Sample solution* and *Control solution*
Acceptance criteria: After 5 min, any opalescence in the *Sample solution* is not more intense than that in the *Control solution* (200 ppm).
- **HEAVY METALS**
Sodium sulfide solution: Dissolve 5 g of sodium sulfide in 10 mL of water. Add 30 mL of glycerin.
Standard lead solution: Prepare as directed for *Special Reagents* in *Heavy Metals* (231).
Standard solution: Transfer 1.0 mL of the *Standard lead solution* to a 10-mL volumetric flask. Add 1 mL of 50% acetic acid and 2 drops of 25% sodium hydroxide, and dilute with water to volume.
Sample solution: Dissolve 5 g of Racemethionine by adding 5 mL of 16% hydrochloric acid and 5 mL of water. Adjust with 25% sodium hydroxide to a pH of 3.0–4.0. Dilute with water to 50 mL. Shake for approximately 15 min, and filter.
Analysis: Add 1 drop of *Sodium sulfide solution* to 10 mL of the *Sample solution*, and add 1 drop of *Sodium sulfide solution* to 10 mL of the *Standard solution*. Let stand for 5 min. View downward over a white surface.
Acceptance criteria: The color of the solution from the *Sample solution* is not darker than that of the solution from the *Standard solution* (NMT 10 ppm).
- **LIMIT OF IRON**
Standard stock solution (125 ppm): Dissolve 1.727 g of ferric ammonium sulfate [FeNH₄(SO₄)₂ · 12H₂O] in water. Add 50 mL of 10% hydrochloric acid, dilute

with water to 1000 mL, and mix. Dilute 1 mL of this solution with water to 40 mL. Pipet 5 mL of this solution into a 200-mL volumetric flask, dilute with water to volume, and mix.

Standard solution: Transfer 2 mL of the *Standard stock solution* to a 25-mL volumetric flask. Add 5 mL of 16% hydrochloric acid, 50 mg of ammonium persulfate, and 3 mL of 30% ammonium thiocyanate, and dilute with water to volume.

Sample solution: Transfer 1 g of Racemethionine to a 25-mL volumetric flask. Add 5 mL of 16% hydrochloric acid, and dissolve. Add 50 mg of ammonium persulfate and 3 mL of 30% ammonium thiocyanate, and dilute with water to volume.

Blank: Transfer 5 mL of 16% hydrochloric acid to a 25-mL volumetric flask. Add 50 mg of ammonium persulfate and 3 mL of 30% ammonium thiocyanate, and dilute with water to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV-Vis

Analytical wavelength: 475 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Without delay, concomitantly determine the absorbances of each sample, correcting for the *Blank*.

Acceptance criteria: The absorbance of the *Sample solution* is NMT that of the *Standard solution* (NMT 10 ppm).

• LIMIT OF AMMONIUM

Standard solution A: 0.297 mg/mL of USP Ammonium Chloride RS. This solution contains 0.1 mg/mL or 100 ppm of NH_4^+ .

Standard solution B: 0.297 $\mu\text{g/mL}$ of USP Ammonium Chloride RS. This solution contains 0.1 $\mu\text{g/mL}$ or 0.1 ppm of NH_4^+ .

Standard solution C: 2.97 $\mu\text{g/mL}$ of USP Ammonium Chloride RS. This solution contains 1.0 $\mu\text{g/mL}$ or 1 ppm of NH_4^+ .

Standard solution D: 29.7 $\mu\text{g/mL}$ of USP Ammonium Chloride RS. This solution contains 10 $\mu\text{g/mL}$ or 10 ppm of NH_4^+ .

Sample solution: 10 mg/mL of Racemethionine

Electrode system: Use an ammonia-specific,¹ ion-indicating electrode connected to a pH meter capable of measuring potentials (see *pH* (791)).

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, *Standard solution D*, and *Sample solution*

Add 100 mL of water to a 150-mL beaker, place the electrode in the beaker, stir, and measure the potential. Add 1 mL of 10 N sodium hydroxide. Stir, and measure the potential after stabilization. [NOTE—It may take about 5 min.] The potential difference must be less than 20 mV.

Add 100.0 mL each of *Standard solutions A*, *B*, *C*, and *D* to four different 150-mL beakers. To each beaker, add 1 mL of 10 N sodium hydroxide. Place the ammonia electrode in the beaker, stir, and concomitantly measure the potential after stabilization. [NOTE—It may take about 5 min.] Draw a calibration curve of the potential, in mV, versus, the quantity of ammonium (NH_4^+), in mg.

Add 100.0 mL of the *Sample solution* to a 150-mL beaker. Add 1 mL of 10 N sodium hydroxide. Adjust

the pH, if necessary, with 10 N sodium hydroxide to a pH of NLT 11. Place the ammonia electrode in the beaker, stir, and measure the potential after stabilization. [NOTE—It may take about 5 min.] Obtain the quantity of NH_4^+ , in mg, in the 100 mL of the *Sample solution* based on the calibration curve.

Calculate the percentage of ammonium (NH_4^+), in the portion of Racemethionine taken:

$$\text{Result} = (C/W) \times F$$

C = quantity of ammonium in the *Sample solution* from the standard curve (mg)

W = weight of Racemethionine taken to prepare the *Sample solution* (mg)

F = conversion factor to $\mu\text{g/g}$ (ppm), 1×10^6

Acceptance criteria: NMT 200 ppm

Organic Impurities

• PROCEDURE: RELATED SUBSTANCES

Standard solution A: 0.40 mg/mL of USP

Racemethionine RS

Standard solution B: 40 $\mu\text{g/mL}$ of USP

Racemethionine RS

Sample solution A: 20 mg/mL of Racemethionine

Sample solution B: 0.40 mg/mL of Racemethionine

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μL

Developing solvent system: Butyl alcohol, glacial acetic acid, and water (3:1:1)

Spray reagent: 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Sample solution A*, and *Sample solution B*

Develop over a path of 10 cm using the *Developing solvent system*. After air-drying the plate, spray with *Spray reagent*, and heat between 100° and 105° for 15 min. Examine the plate under white light.

Acceptance criteria: Any spot obtained from *Sample solution A*, apart from the principal spot, is not more intense than the spot obtained from *Standard solution B* (NMT 0.2%).

SPECIFIC TESTS

• **pH (791):** 5.4–6.1, in a 20 mg/mL solution

• **Loss on Drying (731):** Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight, determined on 1.000 g.

• TRANSMITTANCE

Sample solution: 10% of Racemethionine in 2 N hydrochloric acid, prepared by sonication

Analysis: Determine the transmittance in a 1-cm cell at 430 nm with a suitable spectrophotometer.

Acceptance criteria: Transmittance of NLT 0.98, corresponding to an absorbance of NMT about 0.009

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light.

• USP REFERENCE STANDARDS (11)

USP Ammonium Chloride RS

USP Racemethionine RS

¹ Orion 95-12 is suitable.

Fully Hydrogenated Rapeseed Oil

Fully hydrogenated rapeseed oil [84681-71-0].

DEFINITION

Fully Hydrogenated Rapeseed Oil is the product obtained by refining and hydrogenating oil obtained from the seeds of *Brassica napus* and *Brassica campestris* (Fam. Cruciferae). The product is a mixture of triglycerides in which the fatty acid composition is a mixture of saturated fatty acids.

IDENTIFICATION

- **A.** It meets the requirements of the test for *Fats and Fixed Oils, Fatty Acid Composition* (401).

IMPURITIES

• ALKALINE IMPURITIES

Sample solution: Prepare a mixture of 2.0 g of Fully Hydrogenated Rapeseed Oil, 1.5 mL of alcohol, and 3.0 mL of toluene. Dissolve by gentle heating.

Analysis: To the *Sample solution* add 0.05 mL of bromo-phenol blue TS, and titrate with 0.01 N hydrochloric acid to a yellow endpoint.

Acceptance criteria: NMT 0.4 mL of 0.01 N hydrochloric acid is required.

- **RESIDUE ON IGNITION** (281): NMT 0.5%, when a 5-g sample of Fully Hydrogenated Rapeseed Oil is ignited at an ignition temperature of $800 \pm 25^\circ$
- **HEAVY METALS, Method II** (231): NMT 10 ppm
- **LIMIT OF NICKEL**

Sample solution: Weigh 5.0 g of Fully Hydrogenated Rapeseed Oil into a previously tared platinum or silica crucible. Cautiously heat the substance, and introduce into it a wick formed from twisted ashless filter paper. Ignite the wick. When the substance ignites, stop heating. After combustion, ignite in a muffle furnace at about 600° . Continue the incineration until white ash is obtained. After cooling, transfer the residue, with the aid of two 2-mL portions of diluted hydrochloric acid, to a 25-mL volumetric flask. Add 0.3 mL of nitric acid, and dilute with water to volume.

Standard stock solution: 0.2 µg/mL of nickel prepared from nickel standard solution TS and water. Prepare immediately before use.

Standard solutions: Into three identical 10-mL volumetric flasks introduce 1.0, 2.0, and 4.0 mL of *Standard stock solution*, respectively. To each flask add a 2.0-mL portion of the *Sample solution*, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a graphite furnace

Absorbance: 232.0 nm

Lamp: Nickel hollow-cathode

Analysis

Samples: *Sample solution* and *Standard solutions* Concomitantly determine the absorbances of the *Samples* at least three times each. Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution*. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the added quantity of nickel. [NOTE—The *Sample solution* should be plotted as if it had a content of added nickel equivalent to 0 µg.] Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel, *C*, in µg/mL, in the *Sample solution*.

Calculate the content of nickel in the portion of Fully Hydrogenated Rapeseed Oil taken:

$$\text{Result} = (C/W) \times V$$

C = concentration of nickel in the *Sample solution* (µg/mL)

W = weight of Fully Hydrogenated Rapeseed Oil (g)

V = volume of the *Sample solution*, 25 mL

Acceptance criteria: NMT 1 ppm

- **LIMIT OF ERUCIC ACID:** NMT 1.0%, as determined under *Specific Tests*, in the test *Fats and Fixed Oils, Fatty Acid Composition* (401)

SPECIFIC TESTS

- **FATS AND FIXED OILS, Fatty Acid Composition** (401): Fully Hydrogenated Rapeseed Oil exhibits the fatty acid composition profile shown in *Table 1*.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
14	0	<1.0
16	0	3–5
18	0	38–42
20	0	8–10
22	0	42–50
24	0	1.0–2.0
18	1	≤1.0
18	2	<1.0
20	1	<1.0
22 ^a	1	≤1.0

^a Erucic acid.

- **FATS AND FIXED OILS, Acid Value** (401): NMT 6.0
- **FATS AND FIXED OILS, Iodine Value** (401): NMT 4
- **FATS AND FIXED OILS, Peroxide Value** (401): NMT 2.0
- **FATS AND FIXED OILS, Unsaponifiable Matter** (401): NMT 1.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No storage requirements specified.

Superglycerinated Fully Hydrogenated Rapeseed Oil

Superglycerinated fully hydrogenated rapeseed oil.

DEFINITION

Superglycerinated Fully Hydrogenated Rapeseed Oil is the product obtained by refining, hydrogenating, and glycerinating oil obtained from the seeds of *Brassica napus* and *Brassica campestris* (Fam. Cruciferae). The product is a mixture of mono-, di-, and triglycerides, with triglycerides as a minor component.

[NOTE—Use compendial grade glycerin as a starting material.]

IDENTIFICATION

- **A.** It meets the requirements of the test for *Fats and Fixed Oils, Fatty Acid Composition* (401).

COMPOSITION

• CONTENT OF 1-MONOGLYCERIDES

Periodic acid solution: Dissolve 5.4 g of periodic acid in 100 mL of water, add 1900 mL of glacial acetic acid, and mix. Preserve in a light-resistant, glass-stoppered bottle.

Chloroform: Use chloroform that meets the following test. Add 50.0 mL of *Periodic acid solution* to each of three 500-mL flasks. Add 50 mL of chloroform and 10 mL of water to two of the flasks, and add 50 mL of water to the third flask. Add 20 mL of potassium iodide

TS to each flask, mix gently, and continue as directed in the *Analysis*, beginning with "and allow to stand at least 1 min, but no longer than 5 min, before titrating". The difference between the volume of 0.1 N sodium thiosulfate VS required in the titrations with and without the chloroform is not greater than 0.5 mL.

Sample solution: Melt Superglycerinated Fully Hydrogenated Rapeseed Oil at a temperature not higher than 10° above its melting point, and mix thoroughly. Transfer an accurately weighed quantity of it, equivalent to about 150 mg of 1-monoglycerides, to a 100-mL beaker, dissolve in 25 mL of *Chloroform*, and mix.

Analysis: Transfer the *Sample solution*, with the aid of an additional 25 mL of *Chloroform*, to a separator. Wash the beaker with 25 mL of water, and add the washing to the separator. Close the separator tightly with a stopper, shake vigorously for 30–60 s, and allow the layers to separate.

[NOTE—Add 1–2 mL of glacial acetic acid to break emulsions due to the presence of soap.]

Collect the aqueous layer in a 500-mL glass-stoppered Erlenmeyer flask, and again extract the chloroform solution in the separator with two 25-mL portions of water. Retain the combined aqueous extracts, which will be used in the test for *Limit of Free Glycerin*. Transfer the chloroform layer to a 500-mL glass-stoppered Erlenmeyer flask, and add 50.0 mL of *Periodic acid solution* to this flask and to each of two blank flasks containing a mixture of 50 mL of *Chloroform* and 10 mL of water. Swirl the flasks during the addition of *Periodic acid solution*, and allow to stand for at least 30 min, but no longer than 90 min. To each flask, add 20 mL of potassium iodide TS, and allow to stand at least 1 min, but no longer than 5 min, before titrating. Add 100 mL of water, and titrate with 0.1 N sodium thiosulfate VS, using a magnetic stirrer to keep the solution thoroughly mixed, to the disappearance of the brown iodine color. Add 2 mL of starch TS, and continue the titration to the disappearance of the blue color.

Calculate the percentage of 1-monoglycerides in the portion of Superglycerinated Fully Hydrogenated Rapeseed Oil taken:

$$\text{Result} = \{[M_1 \times (V_B - V_S) \times N]/(W \times A)\} \times 100$$

- M_1 = molecular weight of glyceryl monostearate, 358
 V_B = volume of sodium thiosulfate VS consumed in the blank determination (mL)
 V_S = volume of sodium thiosulfate VS required in the titration of the Superglycerinated Fully Hydrogenated Rapeseed Oil (mL)
 N = normality of the sodium thiosulfate VS
 W = weight of the Superglycerinated Fully Hydrogenated Rapeseed Oil taken to prepare the *Sample solution* (mg)
 A = factor number, 2

Acceptance criteria: 90.0%–110.0% of that indicated on the label

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.5%, when a 5-g sample of Superglycerinated Fully Hydrogenated Rapeseed Oil is ignited at an ignition temperature of $800 \pm 25^\circ$
- **HEAVY METALS, Method II** (231): NMT 10 ppm
- **LIMIT OF NICKEL**

Sample solution: Weigh 5.0 g of Superglycerinated Fully Hydrogenated Rapeseed Oil into a previously tared platinum or silica crucible. Cautiously heat the substance, and introduce into it a wick formed from twisted ashless filter paper. Ignite the wick. When the substance ignites, stop heating. After combustion, ignite in a muffle furnace at about 600° . Continue the incineration until white ash is obtained. After cooling,

transfer the residue, with the aid of two 2-mL portions of diluted hydrochloric acid, to a 25-mL volumetric flask. Add 0.3 mL of nitric acid, and dilute with water to volume.

Nickel standard solution: Immediately before use, dilute 10 mL of nickel standard solution TS with water to 500 mL. This solution contains the equivalent of 0.2 µg/mL of nickel.

Standard solutions: Into three identical 10-mL volumetric flasks, introduce respectively 1.0, 2.0, and 4.0 mL of *Nickel standard solution*. To each flask, add a 2.0-mL portion of the *Sample solution*, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a graphite furnace

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Analysis

Samples: *Sample solution* and *Standard solutions*
 Concomitantly determine the absorbances at least three times each, at the wavelength of maximum absorbance. Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution*. Plot the absorbances of the *Sample solution* and the *Standard solutions* versus the added quantity of nickel.

[NOTE—The *Sample solution* should be plotted as if it had a content of added nickel equivalent to 0 µg.] Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel, C , in µg/mL, in the *Sample solution*.

Calculate the content of nickel in the portion of Superglycerinated Fully Hydrogenated Rapeseed Oil taken:

$$\text{Result} = (V \times C)/W$$

- V = volume of the *Sample solution*, 25 mL
 C = concentration of nickel in the *Sample solution* (µg/mL)
 W = weight of Superglycerinated Fully Hydrogenated Rapeseed Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 1 µg/g (ppm)

- **LIMIT OF ERUCIC ACID:** NMT 1.0%, as determined in the test for *Fats and Fixed Oils* (401), *Fatty Acid Composition*
- **LIMIT OF FREE GLYCERIN**

Periodic acid solution and Chloroform: Prepare as directed in the test for *Content of 1-Monoglycerides*.

Sample solution: Use the combined aqueous extracts obtained as directed in the test for *Content of 1-Monoglycerides*.

Analysis: Transfer 50.0 mL of *Periodic acid solution* to each of two flasks: a 500-mL glass-stoppered Erlenmeyer flask containing the *Sample solution* and a 500-mL glass-stoppered Erlenmeyer blank flask containing 75 mL of water. Continue as directed for *Analysis* in the test for *Content of 1-Monoglycerides*, beginning with "Swirl the flasks during the addition of *Periodic acid solution*, and allow to stand for at least 30 min, but no longer than 90 min".

Calculate the percentage of free glycerin in the portion of Superglycerinated Fully Hydrogenated Rapeseed Oil taken:

$$\text{Result} = \{[M_1 \times (V_B - V_S) \times N]/(W \times A)\} \times 100$$

- M_1 = molecular weight of glycerin, 92
 V_B = volume of sodium thiosulfate VS consumed in the blank determination (mL)

- V_S = volume of sodium thiosulfate VS required in the titration of the Superglycerinated Fully Hydrogenated Rapeseed Oil (mL)
 N = normality of the sodium thiosulfate VS
 W = weight of the Superglycerinated Fully Hydrogenated Rapeseed Oil taken to prepare the *Sample solution* as directed in the test for *Content of 1-Monoglycerides* (mg)
 A = factor number, 4
Acceptance criteria: NMT 1%

SPECIFIC TESTS

- **FATS AND FIXED OILS**, *Acid Value* <401>: NMT 6.0
- **FATS AND FIXED OILS**, *Fatty Acid Composition* <401>: Superglycerinated Fully Hydrogenated Rapeseed Oil exhibits the fatty acid composition profile shown in *Table 1*.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
14	0	<1.0
16	0	3–5
18	0	38–42
20	0	8–10
22	0	42–50
24	0	1.0–2.0
18	1	≤1.0
18	2	<1.0
20	1	<1.0
22 ^a	1	≤1.0

^a Erucic acid.

- **FATS AND FIXED OILS**, *Hydroxyl Value* <401>: NLT 90.0% and NMT 110.0% of that indicated on the label
- **FATS AND FIXED OILS**, *Iodine Value* <401>: NMT 4
- **FATS AND FIXED OILS**, *Peroxide Value* <401>: NMT 2.0
- **FATS AND FIXED OILS**, *Unsaponifiable Matter* <401>: NMT 1.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No storage requirements specified.
- **LABELING:** Label it to indicate the hydroxyl value and the content of 1-monoglycerides.

Rose Oil**DEFINITION**

Rose Oil is volatile oil distilled with steam from the fresh flowers of *Rosa gallica* L., *Rosa damascena* Miller, *Rosa alba* L., *Rosa centifolia* L., and varieties of these species (Fam. Rosaceae).

SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>
Analysis: Measure at 30° compared with water at 15°. **Acceptance criteria:** 0.848–0.863
- **OPTICAL ROTATION** <781A>: –1° to –4°
- **REFRACTIVE INDEX** <831>: 1.457–1.463 at 30°
- **SOLUBILITY TEST**
Analysis: 1 mL is miscible with 1 mL of chloroform without turbidity. Add 20 mL of 90% alcohol to this mixture.
Acceptance criteria: The resulting liquid is neutral or acid to moistened litmus paper and, upon standing at 20°, deposits crystals within 5 min.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-filled, tight containers.

Rose Water Ointment—see Rose Water Ointment General Monographs**Stronger Rose Water****DEFINITION**

Stronger Rose Water is a saturated solution of the odoriferous principals of the flowers of *Rosa centifolia* L. (Fam. Rosaceae) prepared by distilling the fresh flowers with water and separating the excess volatile oil from the clear, water portion of the distillate. [NOTE—Stronger Rose Water, diluted with an equal volume of purified water, may be supplied when “Rose Water” is required.]

IMPURITIES

- **HEAVY METALS**, *Method I* <231>
Test preparation: Stronger Rose Water, 1 N acetic acid, and water (10:2:13)
Acceptance criteria: NMT 2 µg/g

SPECIFIC TESTS

- **REACTION:** Neutral or acidic to litmus
- **RESIDUE ON EVAPORATION**
Sample: 100 mL
Analysis: Evaporate the sample on a steam bath, and dry the residue at 105° for 1 h.
Acceptance criteria: NMT 15 mg (0.015%)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** The odor of Stronger Rose Water is best preserved by allowing a limited access of fresh air to the container.

Saccharin

$C_7H_5NO_3S$ 183.18
 1,2-Benzisothiazol-3(2H)-one, 1,1-dioxide;
 1,2-Benzisothiazolin-3-one 1,1-dioxide [81-07-2].

DEFINITION

Saccharin contains NLT 99.0% and NMT 101.0% of $C_7H_5NO_3S$, calculated on the dried basis.

IDENTIFICATION

- **INFRARED ABSORPTION** <197K>

ASSAY

- **PROCEDURE**
Sample: 500 mg
Analysis: Dissolve the *Sample* in 40 mL of alcohol. Add 40 mL of water and phenolphthalein TS. Titrate with 0.1 N sodium hydroxide. Perform a blank titration, if necessary, and make the appropriate correction. Each mL of 0.1 N sodium hydroxide is equivalent to 18.32 mg of $C_7H_5NO_3S$.

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION** (281): NMT 0.2%. The ignition temperature is $600 \pm 50^\circ$.

• **HEAVY METALS, Method II** (231): NMT 10 ppm

Organic Impurities

• PROCEDURE 1: LIMIT OF TOLUENESULFONAMIDES

Internal standard solution: 0.25 mg/mL of caffeine in methylene chloride

Standard stock solution: 20.0 μ g/mL of USP *o*-Toluenesulfonamide RS and 20.0 μ g/mL of USP *p*-Toluenesulfonamide RS in methylene chloride

Standard solution: Evaporate 5.0 mL of the *Standard stock solution* to dryness in a stream of nitrogen. Dissolve the residue in 1 mL of the *Internal standard solution*.

Sample solution: Suspend 10 g of Saccharin in 20 mL of water, and dissolve using 5–6 mL of 10 N sodium hydroxide. If necessary, adjust the solution with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of 7–8, and dilute with water to 50 mL. Shake the solution with four quantities each of 50 mL of methylene chloride. Combine the lower layers, dry over anhydrous sodium sulfate, and filter. Wash the filter and the sodium sulfate with 10 mL of methylene chloride. Combine the solution and the washings, and evaporate almost to dryness in a water bath at a temperature not exceeding 40° . Using a small quantity of methylene chloride, quantitatively transfer the residue into a suitable 10-mL tube, evaporate to dryness in a stream of nitrogen, and dissolve the residue in 1.0 mL of the *Internal standard solution*.

Blank solution: Evaporate 200 mL of methylene chloride to dryness in a water bath at a temperature not exceeding 40° . Dissolve the residue in 1 mL of methylene chloride.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm \times 10-m fused silica column, coated with G3 phase (film thickness 2 μ m)

Temperature

Injector: 250°

Detector: 250°

Column: 180°

Carrier gas: Nitrogen

Flow rate: 10 mL/min

Injection size: 1 μ L

Split ratio: 2:1

System suitability

Samples: *Standard solution* and *Blank solution*

[NOTE—The substances are eluted in the following order: *o*-toluenesulfonamide, *p*-toluenesulfonamide, and caffeine.]

Suitability requirements: No peaks at the retention times for the internal standard, *o*-toluenesulfonamide, or *p*-toluenesulfonamide; *Blank solution*

Resolution: NLT 1.5 between *o*-toluenesulfonamide and *p*-toluenesulfonamide, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: If any peaks due to *o*-toluenesulfonamide and *p*-toluenesulfonamide appear in the chromatogram obtained with the *Sample solution*, the ratio of their areas to that of the *Internal standard solution* is NMT the corresponding ratio in the chromatogram obtained with the *Standard solution*.

Individual impurities: See *Impurity Table 1*.

Impurity Table 1

Name	Acceptance Criteria (ppm)
<i>o</i> -Toluenesulfonamide	10
<i>p</i> -Toluenesulfonamide	10

• PROCEDURE 2: LIMIT OF BENZOATE AND SALICYLATE

Sample solution: 10 mL of a hot, saturated solution of saccharin

Analysis: Add ferric chloride TS dropwise to the *Sample solution*.

Acceptance criteria: No precipitate or violet color appears in the liquid.

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE** (741): 226° – 230°

• **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 1.0% of its weight.

• **READILY CARBONIZABLE SUBSTANCES TEST** (271)

Sample solution: 40 mg/mL in sulfuric acid (94.5%–95.5% [w/w] of H_2SO_4), maintained at 48° – 50° for 10 min

Acceptance criteria: The *Sample solution* has no more color than *Matching Fluid A*, when viewed against a white background.

• **CLARITY OF SOLUTION**

[NOTE—The *Sample solution* is to be compared to *Reference suspension A* and to water in diffused daylight 5 min after preparation of *Reference suspension A*.]

Diluent: 200-g/L solution of sodium acetate

Hydrazine solution: 10.0 mg/mL of hydrazine sulfate.

[NOTE—Allow to stand for 4–6 h.]

Methenamine solution: Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension: Transfer 25.0 mL of *Hydrazine solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h. [NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use. Allow the suspension to stand for 24 h.]

Opalescence standard: Dilute 15.0 mL of the *Primary opalescent suspension* with water to 1000 mL. [NOTE—This suspension should not be used beyond 24 h after preparation.]

Reference suspension A: *Opalescence standard* and water (1 in 20)

Reference suspension B: *Opalescence standard* and water (1 in 10)

Sample solution: 200 mg/mL in *Diluent*

Analysis

Samples: *Diluent*, *Reference suspension A*, *Reference suspension B*, *Sample solution*, and water

Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Reference suspension A*, *Reference suspension B*, water, and *Diluent* to separate matching test tubes. Compare the solutions in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*). [NOTE—The diffusion of light must be such that *Reference suspension A* can readily be distinguished from water, and that *Reference suspension B* can readily be distinguished from *Reference suspension A*.]

Acceptance criteria: The *Sample solution* shows the same clarity as that of water, or *Diluent*, or its opalescence is NMT that of *Reference suspension A*.

• COLOR OF SOLUTION

Diluent A: 200-g/L solution of sodium acetate

Diluent B: 10-g/L solution of hydrochloric acid

Standard stock solution: Ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and *Diluent B* (3.0:3.0:2.4:1.6)

Standard solution: *Standard stock solution* and *Diluent B* (1 in 100). [NOTE—Prepare the *Standard solution* immediately before use.]

Sample solution: Use the *Sample solution* from the test for *Clarity of Solution*.

Analysis

Samples: *Diluent A*, *Standard solution*, *Sample solution*, and water

Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of the *Standard solution*, *Diluent A*, and water to separate, matching test tubes. Compare the solutions in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* <851>, *Visual Comparison*).

Acceptance criteria: The *Sample solution* has the appearance of water or *Diluent A*, or is not more intensely colored than the *Standard solution*.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

• **USP REFERENCE STANDARDS** <11>

USP Saccharin RS

USP *o*-Toluenesulfonamide RS

USP *p*-Toluenesulfonamide RS

Saccharin Calcium—see *Saccharin Calcium General Monographs*

Saccharin Sodium—see *Saccharin Sodium General Monographs*

Safflower Oil—see *Safflower Oil General Monographs*

Sesame Oil

DEFINITION

Sesame Oil is the refined fixed oil obtained from the seed of one or more cultivated varieties of *Sesamum indicum* L. (Fam. Pedaliaceae). It may contain suitable antioxidants.

IDENTIFICATION

• **A.** The peak responses for the eight major triglycerides—LLL, OLL, PLL, OOL, POL, OOO, SOL, and POO—elute between 0 and about 40 min, in the order specified, and at relative retention times of about 0.55, 0.65, 0.69, 0.77, 0.82, 0.93, 0.97, and 1.0, respectively, as obtained in the chromatogram of the *Sample solution* in the test for *Triglyceride Composition*.

ASSAY

• TRIGLYCERIDE COMPOSITION

[NOTE—The fatty acid radicals are designated as linoleic (L), oleic (O), palmitic (P), and stearic (S), and the com-

mon abbreviations for triglycerides used are as follows: trilinolein (LLL), 1,2-dilinoleoyl-3-oleoyl-rac-glycerol (OLL), 1,2-dilinoleoyl-3-palmitoyl-rac-glycerol (PLL), 1,2-dioleoyl-3-linoleoyl-rac-glycerol (OOL), 1-palmitoyl-2-oleoyl-3-linoleoyl-rac-glycerol (POL), triolein (OOO), 1-linoleoyl-2-oleoyl-3-stearoyl-rac-glycerol (SOL), and 1,2-dioleoyl-3-palmitoyl-rac-glycerol (POO).]

Mobile phase: Acetonitrile and methylene chloride (60:40)

System suitability solution: 3.0 mg/mL of USP Sesame Oil Related Compound A RS and USP Sesame Oil Related Compound B RS in *Mobile phase*. [NOTE—USP Sesame Oil Related Compound A RS is OLL, and USP Sesame Oil Related Compound B RS is PLL.]

Sample solution: 20 mg/mL of Sesame Oil in *Mobile phase*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: Two 4.6-mm × 25-cm columns in series; packings L1

Column temperature: 30°

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for OLL and PLL are about 0.93 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.8 between OLL and PLL

Relative standard deviation: NMT 1.5% determined from peak areas; NMT 2.2% determined from the peak area ratio of OLL to PLL

Analysis

[NOTE—The relative retention times for the eight major triglyceride peaks are listed in *Table 1*.]

Sample: *Sample solution*

Calculate the percentage of each of these triglycerides in the portion of sample taken:

$$\text{Result} = (A/B) \times 100$$

A = peak area for each individual triglyceride
B = sum of the areas of all the peaks, excluding the solvent peak

Table 1

Triglyceride	Relative Retention Time	Composition (%)
LLL	0.55	7.0–19.0
OLL	0.65	13.0–30.0
PLL	0.69	5.0–9.0
OOL	0.77	14.0–25.0
POL	0.82	8.0–16.0
OOO	0.93	5.0–14.0
SOL	0.97	2.0–8.0
POO	1.0	2.0–8.0

IMPURITIES

• **HEAVY METALS, Method II** <231>: NMT 10 µg/g

SPECIFIC TESTS

• **SPECIFIC GRAVITY** <841>: 0.916–0.921

• **FATS AND FIXED OILS, Acid Value (Free Fatty Acids)** <401>

Sample: 10 g

Acceptance criteria: NMT 2.0 mL of 0.020 N sodium hydroxide is required for neutralization.

- **FATS AND FIXED OILS**, *Iodine Value* (401): 103–116
- **FATS AND FIXED OILS**, *Saponification Value* (401): 188–195
- **FATS AND FIXED OILS**, *Solidification Temperature of Fatty Acids* (401): 20°–25°
- **FATS AND FIXED OILS**, *Unsaponifiable Matter* (401): NMT 1.5%
- **COTTONSEED OIL**
Sample: 5 mL
Analysis: Mix the *Sample* in a test tube with 5 mL of a mixture of equal volumes of amyl alcohol and a 10-mg/mL solution of sulfur in carbon disulfide. Warm the mixture carefully until the carbon disulfide is expelled, and immerse the tube to one-third of its depth in a boiling saturated solution of sodium chloride.
Acceptance criteria: No reddish color develops within 15 min.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and prevent exposure to excessive heat.
- **LABELING:** Label it to indicate the name and quantity of any added antioxidant.
- **USP REFERENCE STANDARDS** (11)
 USP Sesame Oil Related Compound A RS
 USP Sesame Oil Related Compound B RS

Shellac

DEFINITION

Shellac is obtained by the purification of Lac, the resinuous secretion of the insect *Laccifer lacca* (Kerr) (Fam. Coccidae). Orange Shellac is produced either by a process of filtration in the molten state or by hot solvent process, or both. Orange Shellac may retain most of its wax or be dewaxed, and may contain lesser amounts of the natural color than originally present. Bleached (White) Shellac is prepared by dissolving the Lac in aqueous sodium carbonate, bleaching the solution with sodium hypochlorite, and precipitating the Bleached Shellac with 2 N sulfuric acid. Removal of the wax, by filtration, during the process results in Refined Bleached Shellac. Shellac conforms to the specifications in the table below.

	Acid Value (on dried basis)	Loss on Drying (%)	Wax (%)
Orange Shellac	68–76	NMT 2.0	NMT 5.5
Dewaxed Orange Shellac	71–79	NMT 2.0	NMT 0.2
Regular Bleached Shellac	73–89	NMT 6.0	NMT 5.5
Refined Bleached Shellac	75–91	NMT 6.0	NMT 0.2

IDENTIFICATION

- **A.**
Sample: 50 mg
Analysis: To the *Sample* add a few drops of a mixture of 1 g of ammonium molybdate and 3 mL of sulfuric acid.
Acceptance criteria: A green color is produced, and it becomes lilac on standing for 5 min.

IMPURITIES

- **HEAVY METALS**, *Method II* (231): NMT 10 µg/g

SPECIFIC TESTS

- **LOSS ON DRYING** (731)
Analysis: Dry at 41 ± 2° in a well-ventilated oven for 24 h.

Acceptance criteria: See the table in the *Definition*.

• ACID VALUE

Sample solution: Dissolve 2 g of finely ground Shellac in 50 mL of alcohol that has been neutralized to phenolphthalein with 0.1 N sodium hydroxide.

Analysis: Add additional phenolphthalein TS if necessary, and titrate with 0.1 N sodium hydroxide VS to a pink endpoint. Express the acid value in terms of the number of mg of potassium hydroxide required per g of dried Shellac. [NOTE—For orange Shellac titrate slowly, stirring vigorously, until a glass rod dipped into the titrated solution produces a color change when touched to a drop of thymol blue TS on a spot plate.]

Acceptance criteria: See the table in the *Definition*.

• WAX

Sample: 10 g of finely ground Shellac

Analysis: Transfer the *Sample* and 2.50 g of sodium carbonate to a 200-mL, tall-form beaker. Add 150 mL of hot water, immerse the beaker in a boiling water bath, and stir until the solid is dissolved. Cover the beaker with a watch glass, and maintain the heat for 3 h more without agitation. Remove the beaker to a cold water bath. When the wax has floated to the surface, pass the solution through medium-speed quantitative ashless filter paper, transferring the wax to the paper, and wash the filter with water. Pour 5–10 mL of alcohol onto the filter to facilitate drying. Wrap the paper loosely in a larger piece of filter paper, bind with a piece of fine wire, and dry with the aid of gentle heat. Extract with chloroform in a suitable continuous extraction apparatus for 2 h, using a weighed flask to receive the extracted wax and solvent. Evaporate the solvent, and dry the wax at 105° to constant weight.

Acceptance criteria: See the table in the *Definition*.

• ROSIN

Sample solution: 200 mg/mL in dehydrated alcohol

Analysis: To 10 mL of *Sample solution* add slowly, with shaking, 50 mL of solvent hexane, wash with two successive 50-mL portions of water, filter the washed alcohol–solvent hexane solution, and evaporate to dryness. To the residue add 2 mL of a mixture of liquefied phenol, dehydrated alcohol, and solvent hexane (1:0.5:2). Stir, and transfer a portion of the solution to a cavity of a color-reaction plate. Fill an adjacent cavity with a mixture of bromine and solvent hexane (1:4), and cover both cavities with an inverted watch glass.

Acceptance criteria: No purple or deep indigo-blue color is produced in or above the liquid containing the residue.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, preferably in a cold place.
- **LABELING:** Label it to indicate whether it is bleached or is orange, and whether it is dewaxed or wax-containing.

Dental-Type Silica

DEFINITION

Dental-Type Silica is obtained from sodium silicate solution by destabilizing with acid in such a way as to yield very fine particles. The sum of the Assay values for Silicon Dioxide and Sodium Sulfate is NLT 98.0%.

ASSAY

• SILICON DIOXIDE

Sample: 1 g

Analysis: Ignite the *Sample* at 1000° for 1 h, cool in a desiccator, and weigh. Carefully wet with water, and add 10 mL of hydrofluoric acid, in small increments. Evaporate on a steam bath to dryness, and cool. Add about 10 mL of hydrofluoric acid and about 0.5 mL of

sulfuric acid, and evaporate to dryness. Slowly increase the temperature until all of the acids have been volatilized, and ignite at 1000°. Cool in a desiccator, and weigh. The difference between the final weight and the weight of the initially ignited portion represents the weight of SiO₂.

• **SODIUM SULFATE**

Sample: 1 g

Analysis 1: In a platinum dish, wet the *Sample* with a few drops of water, add 15 mL of perchloric acid, and place the dish on a hot plate. Add 10 mL of hydrofluoric acid. Heat until copious fumes are evolved. Add 5 mL of hydrofluoric acid, and again heat to copious fumes. Add 5 mL of boric acid solution (1 in 25), and heat to fumes. Cool, and transfer the residue to a 400-mL beaker with the aid of 10 mL of hydrochloric acid. Adjust the volume with water to about 300 mL, and bring to boiling on a hot plate. Add 20 mL of hot barium chloride TS. Keep the beaker on the hot plate for 2 h, maintaining the volume above 200 mL. After cooling, transfer the precipitate and solution to a dried, tared crucible with a filter of 0.8-μm pore size. Wash the filter and precipitate 8 times with hot water, dry the crucible at 105° for 1 h, and weigh. The weight, multiplied by 0.6085, is the sodium sulfate content of the amount of specimen taken.

Acceptance criteria 1: NMT 4.0%

Analysis 2: Calculate the sum of the *Assay* values for the silicon dioxide and the sodium sulfate, and calculate the percentage in the Dental-Type Silica taken.

Acceptance criteria 2: NLT 98.0%

SPECIFIC TESTS

• **PH** (791)

Sample solution: 50 mg/mL of slurry

Acceptance criteria: 4.0–8.5

• **LOSS ON DRYING** (731)

Analysis: Dry a sample at 105° for 2 h.

Acceptance criteria: It loses NMT the maximum percentage of its weight as indicated in the labeling.

• **LOSS ON IGNITION** (733)

Sample: 1 g, previously dried

Analysis: Ignite the *Sample* at 1000° for NLT 1 h.

Acceptance criteria: NMT 8.5%

• **CHLORIDE AND SULFATE, Chloride** (221)

Sample solution: Boil 5 g in 50 mL of water under a reflux condenser for 2 h, cool, and filter.

Control: 1.0 mL of 0.020 N hydrochloric acid

Analysis: Use a 7-mL portion of *Sample solution*.

Acceptance criteria: 0.1%; the *Sample solution* shows no more chloride than the *Control*.

• **ARSENIC, Method I** (211)

Sample solution: Transfer 4.0 g of Dental-Type Silica to a platinum dish, add 5 mL of nitric acid and 35 mL of hydrofluoric acid, and evaporate on a steam bath. Cool, add 5 mL of perchloric acid, 10 mL of hydrofluoric acid, and 10 mL of sulfuric acid, and evaporate on a hot plate to the production of heavy fumes. Cool, cautiously transfer to a 100-mL beaker with the aid of a few mL of hydrochloric acid, and evaporate to dryness. Cool, add 5 mL of hydrochloric acid, dilute with water to about 40 mL, and heat to dissolve any residue. Cool, transfer to a 100-mL volumetric flask, and dilute with water to volume.

Analysis: Use a 25.0-mL portion of *Sample solution*.

Acceptance criteria: NMT 3 ppm

• **HEAVY METALS, Method I** (231)

Test preparation: 16.7 mL of the solution prepared in the test for *Arsenic*

Analysis: Transfer the *Test preparation* to a 100-mL beaker, and neutralize to litmus paper with ammonium hydroxide. Adjust with 6 N acetic acid to a pH between 3 and 4. Filter, using medium-speed filter paper, and wash with water until the filtrate and washings measure 40 mL.

Acceptance criteria: NMT 30 ppm

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate the maximum percentage of loss on drying.

Hydrophobic Colloidal Silica

[68611-44-9].

DEFINITION

Hydrophobic Colloidal Silica is prepared by partial alkylation for hydrophobation. It contains NLT 99.0% and NMT 101.0% of SiO₂, calculated on the ignited basis.

IDENTIFICATION

• **A.**

Sample: 25 mg

Analysis: Add the *Sample* to a platinum crucible, and ignite at 900° for 2 h. Using a copper wire, mix the ignited substance with 10 mg of sodium fluoride and a few drops of sulfuric acid to give a thin slurry. Cover the crucible with a thin, transparent plate of plastic under which a drop of water is suspended, and warm gently.

Acceptance criteria: Within a short time, a white ring is rapidly formed around the drop of water.

- **B.** It meets the requirements in *Specific Tests* for *Water-Dispersible Substances*.

ASSAY

• **PROCEDURE**

Sample: The residue obtained in the test for *Loss on Ignition*

Analysis: To the *Sample* add sufficient alcohol to moisten the residue completely, and then add 0.2 mL of sulfuric acid. Add 6 mL of hydrofluoric acid, and evaporate to dryness on a hot plate at about 100°, taking care to avoid loss from sputtering. Wash down the sides of the platinum crucible with 6 mL of hydrofluoric acid, and evaporate to dryness. Ignite at 900° for 2 h, cool in a desiccator, and weigh. The difference between the weight of the residue obtained in the test for *Loss on Ignition* and the weight of the final residue gives the amount of SiO₂ in the quantity of the substance to be examined.

Acceptance criteria: 99.0%–101.0% on the ignited basis

IMPURITIES

• **LOSS ON IGNITION** (733)

Sample: 0.2 g

Analysis: Ignite the *Sample* in a platinum crucible at 900° for 2 h. Cool in a desiccator before weighing.

[NOTE—It is advisable to place the crucible in a cold oven and then heat up the oven.]

Acceptance criteria: NMT 6.0%

• **LIMIT OF LEAD**

Select reagents having as low a lead content as practicable, and store all solutions in containers of borosilicate glass. Rinse all glassware thoroughly with warm, dilute nitric acid (1 in 2) followed by water.

Ammonium acetate buffer solution, pH 3.5: Weigh 25.0 g of ammonium acetate, and dissolve in 25 mL of water. Add 38.0 mL of dilute hydrochloric acid. Adjust the pH, if necessary, with dilute hydrochloric acid or weak ammonia solution (containing 460 mL/L of strong ammonia solution). Dilute with water to 100.0 mL.

Thioacetamide solution: Prepare immediately before use. To 0.2 mL of thioacetamide TS add 1 mL of a mixture of 5 mL of water, 15 mL of 1 N sodium hydroxide,

and 20 mL of 85% glycerol. Heat in a water bath for 20 s.

Sample solution: Suspend 2.5 g of Hydrophobic Colloidal Silica in 30 mL of methanol, stir, and add 30 mL of weak ammonia solution (containing 460 mL/L of strong ammonia solution). With frequent stirring, evaporate on a water bath, and dry the residue in an oven at 140°. When the dried substance is white, break up the mass with a glass rod. Reduce the residue to a powder, and add 15 mL of methanol and 25 mL of 1 N hydrochloric acid. Boil gently for 5 min, stirring frequently with the glass rod. Centrifuge for 20 min, and pass the supernatant through a membrane filter. To the residue in the centrifuge tube add 3 mL of dilute hydrochloric acid and 9 mL of water, and bring to a boil. Centrifuge for 20 min, and pass the supernatant through the same membrane filter. Wash the residue with small quantities of water, combine the filtrates and washings, and dilute with water to 50 mL. To 20 mL of this solution add 50 mg of ascorbic acid and 1 mL of strong ammonia solution. Neutralize with diluted weak ammonia solution (containing 160 mL/L of strong ammonia solution). Dilute with water to 25 mL.

Reference solution: Pipet 10 mL of the *Standard Lead Solution* (see *Heavy Metals* <231>, *Special Reagents*), and mix with 2 mL of the *Sample solution*.

Blank solution: A mixture of 10 mL of water and 2 mL of the *Sample solution*.

Analysis: To the *Sample solution*, *Reference solution*, and *Blank solution* add 2 mL of *Ammonium acetate buffer solution*, pH 3.5.

Mix and add 1.2 mL of *Thioacetamide solution*. Mix immediately. Examine the solutions after 2 min. The test is invalid if the *Reference solution* does not show a slight brown color compared to the *Blank solution*.

Acceptance criteria: 0.0025%; the brown color in the *Sample solution* is not more intense than that in the *Reference solution*. [NOTE—If the result is difficult to judge, pass the solutions through a membrane filter (pore size, 3 µm), and carry out the filtration slowly and uniformly. Compare the spots on the filters obtained with the different solutions.]

• LIMIT OF CHLORIDE

Standard solution: Add 10 mL of 0.15 mM sodium chloride and 5 mL of water. Add 1 mL of dilute nitric acid, and pour into a test tube containing 1 mL of silver nitrate TS.

Sample solution: To 1 g of Hydrophobic Colloidal Silica add 30 mL of methanol and 20 mL of dilute nitric acid. Heat on a water bath for 15 min with frequent stirring. Cool, dilute with water to 50 mL, and filter. Dilute 10 mL of the filtrate with water to 15 mL. Add 1 mL of dilute nitric acid, and pour into a test tube containing 1 mL of silver nitrate TS.

Analysis: Examine the tubes laterally against a black background.

Acceptance criteria: 0.025%; after standing for 5 min protected from light, any opalescence in the *Sample solution* is not more intense than that in the *Standard solution*.

SPECIFIC TESTS

• WATER-DISPERSIBLE SUBSTANCES

Sample: 0.4 g

Analysis: Place the *Sample* in a 500-mL separating funnel, add 100 mL of water, and shake for 1 min. Allow to stand for 1 h. Allow 90 mL of the aqueous phase to run out dropwise without filtration into a suitable dish dried at 140°, and cool in a desiccator. Evaporate to dryness at 140°, starting at a low temperature to avoid splashing. Cool in a desiccator.

Acceptance criteria: 3.0%; the weight of the residue does not exceed 12 mg.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

Purified Siliceous Earth

DEFINITION

Purified Siliceous Earth is a form of silica (SiO₂) consisting of the frustules and fragments of diatoms, purified by calcining.

IMPURITIES

• LOSS ON IGNITION <733>

Sample: 1 g, previously dried

Analysis: Ignite the *Sample* at 980 ± 25° for 1 h in a tared platinum or porcelain crucible.

Acceptance criteria: NMT 2.0%

• LEACHABLE ARSENIC

Sample solution: To 10.0 g in a 250-mL beaker add 50 mL of 0.5 N hydrochloric acid, cover with a watch glass, and heat at 70° for 15 min. Cool, and decant through a Whatman No. 3 filter paper into a 100-mL volumetric flask. Wash the slurry with three 10-mL portions of water, preheated to 70°, and dilute with water to volume.

Analysis: A 3.0-mL portion of the *Sample solution* meets the requirements in *Arsenic, Method 1* <211>.

Acceptance criteria: NMT 10 µg/g

• LEACHABLE LEAD

Sample: A 10.0-mL portion of the *Sample solution* prepared in the test for *Leachable Arsenic*

Control: 10 mL of *Diluted Standard Lead Solution* in *Lead* <251>

Analysis: The *Sample* meets the requirements in *Lead* <251>.

Acceptance criteria: NMT 10 µg/g

• LIMIT OF NONSILICEOUS SUBSTANCES

Sample: 200 mg

Analysis: Transfer the *Sample* to a tared platinum crucible, add 5 mL of hydrofluoric acid and 2 drops of dilute sulfuric acid (1 in 2), and evaporate gently to dryness. Cool, add 5 mL of hydrofluoric acid, evaporate again to dryness, and ignite to constant weight.

Acceptance criteria: The weight of the residue is NMT 50 mg.

SPECIFIC TESTS

• LOSS ON DRYING <731>

Analysis: Dry a sample at 105° for 2 h.

Acceptance criteria: NMT 0.5%

• ACID-SOLUBLE SUBSTANCES

Sample: 10.0 g

Analysis: Digest the *Sample* with 50 mL of 0.5 N hydrochloric acid at 70° for 15 min, and filter. Wash the residue, adding the washings to the filtrate to obtain a total volume of 100 mL. Evaporate at 110° in a tared porcelain dish to dryness.

Acceptance criteria: NMT 2.0% (weight of the dried residue is NMT 200 mg)

• WATER-SOLUBLE SUBSTANCES

Sample: 12.5 g

Analysis: Place the *Sample* in a 500-mL conical flask, add 250 mL of water, and shake for 2 h at room temperature. Filter with the aid of vacuum, and again filter if necessary to obtain a clear filtrate. Evaporate in a tared platinum or porcelain dish, and dry at 110°.

Acceptance criteria: NMT 0.2% (weight of the residue is NMT 25 mg)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Silicon Dioxide

SiO₂ · xH₂O
Anhydrous

60.08

DEFINITION

Silicon Dioxide is obtained by insolubilizing the dissolved silica in sodium silicate solution. Where obtained by the addition of sodium silicate to a mineral acid, the product is termed silica gel. Where obtained by the destabilization of a solution of sodium silicate in such manner as to yield very fine particles, the product is termed precipitated silica. After ignition at 1000° for NLT 1 h, it contains NLT 99.0% of SiO₂.

IDENTIFICATION

• PROCEDURE

Sample: 5 mg

Analysis: Transfer the *Sample* to a platinum crucible, mix with 200 mg of anhydrous potassium carbonate, ignite at a red heat over a burner for 10 min, and cool. Dissolve the melt in 2 mL of recently distilled water, warming if necessary, and slowly add 2 mL of ammonium molybdate TS.

Acceptance criteria: A deep yellow color is produced.

ASSAY

• PROCEDURE

Sample: 1 g

Analysis: Ignite the *Sample* in a tared platinum dish at 1000° for 1 h, cool in a desiccator, and weigh. Carefully wet with water, and add 10 mL of hydrofluoric acid in small increments. Evaporate on a steam bath to dryness, and cool. Add 10 mL of hydrofluoric acid and 0.5 mL of sulfuric acid, and evaporate to dryness. Slowly increase the temperature until all of the acids have been volatilized, and ignite at 1000°. Cool in a desiccator, and weigh. The difference between the final weight and the weight of the initially ignited portion represents the weight of SiO₂.

Acceptance criteria: NLT 99.0% on the previously ignited basis

IMPURITIES

Inorganic Impurities

• LOSS ON IGNITION (733)

Sample: 1 g

Analysis: Ignite the *Sample*, previously dried and weighed, at 1000° for NLT 1 h.

Acceptance criteria: It loses NMT 8.5% of its weight.

• CHLORIDE AND SULFATE, Chloride (221):

Boil 5 g in 50 mL of water under a reflux condenser for 2 h, cool, and filter. A 7-mL portion of the filtrate shows no more chloride than corresponds to 1.0 mL of 0.020 N hydrochloric acid (0.1%).

• CHLORIDE AND SULFATE, Sulfate (221):

A 10-mL portion of the filtrate from the test for *Chloride* shows no more sulfate than corresponds to 5.0 mL of 0.020 N sulfuric acid (0.5%).

• ARSENIC, Method I (211)

Sample solution: Transfer 4.0 g to a platinum dish. Add 5 mL of nitric acid and 35 mL of hydrofluoric acid, and evaporate on a steam bath. Cool. Add 5 mL of perchloric acid, 10 mL of hydrofluoric acid, and 10 mL of sulfuric acid, and evaporate on a hot plate to the production of heavy fumes. Cool. Cautiously transfer to a 100-mL beaker with the aid of a few mL of hydrochloric acid, and evaporate to dryness. Cool. Add 5 mL of hydrochloric acid, dilute with water to 40 mL, and heat to dissolve any residue. Cool. Transfer to a 100-mL volumetric flask, and dilute with water to volume.

Analysis: Use a 25.0-mL portion of the *Sample solution*.

Acceptance criteria: Meets the requirements of the test (NMT 3 ppm)

• HEAVY METALS, Method I (231)

Sample solution: 16.7 mL of the solution prepared for the test for *Arsenic*

Analysis: Transfer the *Sample solution* to a 100-mL beaker, and neutralize to litmus paper with ammonium hydroxide. Adjust with 6 N acetic acid to a pH between 3 and 4. Filter, using medium-speed filter paper, and wash with water until the filtrate and washings measure 40 mL.

Acceptance criteria: NMT 30 ppm

SPECIFIC TESTS

• PH (791):

4–8 in a slurry (1 in 20)

• LOSS ON DRYING (731):

Dry a sample at 145° for 4 h; it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in tight containers, protected from moisture.

• LABELING:

Label it to state whether it is silica gel or precipitated silica.

Colloidal Silicon Dioxide

SiO₂

60.08

Silica [7631-86-9].

DEFINITION

Colloidal Silicon Dioxide is a submicroscopic fumed silica prepared by the vapor-phase hydrolysis of a silicon compound. When ignited at 1000° for 2 h, it contains NLT 99.0% and NMT 100.5% of SiO₂.

IDENTIFICATION

• A. PROCEDURE

Analysis: Transfer 5 mg to a platinum crucible, and mix with 200 mg of anhydrous potassium carbonate. Heat the crucible to a red color with the aid of a Bunsen burner for 10 min, and cool. Dissolve the melt in 2 mL of freshly distilled water, warming if necessary, and slowly add 2 mL of ammonium molybdate TS to the solution.

Acceptance criteria: A deep yellow color is produced.

• B. PROCEDURE

[NOTE—Avoid contact with o-tolidine when performing this test, and conduct the test in a well-ventilated hood.]

Analysis: Place 1 drop of the yellow silicomolybdate solution from *Identification* test A on a filter paper, and evaporate the solvent. Add 1 drop of a saturated solution of o-tolidine in glacial acetic acid to reduce the silicomolybdate to molybdenum blue, and place the paper over ammonium hydroxide.

Acceptance criteria: A greenish blue spot is produced.

ASSAY

• PROCEDURE

Sample: 500 mg

Analysis: Ignite the *Sample* in a tared platinum crucible at 1000 ± 25° for 2 h, cool in a desiccator, and weigh. Add 3 drops of sulfuric acid, and add enough alcohol to just moisten the sample completely. Add 15 mL of hydrofluoric acid, and in a well-ventilated hood evaporate on a hot plate to dryness, using medium heat (95°–105°) and taking care that the sample does not spatter as dryness is approached. Heat the crucible to a red color with the aid of a Bunsen burner. Ignite the residue at 1000 ± 25° for 30 min, cool in a desiccator, and weigh. If a residue remains, repeat the *Analysis*, be-

ginning with "Add 15 mL of hydrofluoric acid". The weight lost by the assay specimen, previously ignited at $1000 \pm 25^\circ$, represents the weight of SiO_2 in the portion taken.

Acceptance criteria: 99.0%–100.5% on the previously ignited basis

IMPURITIES

Inorganic Impurities

- **LOSS ON IGNITION (733):** Ignite the portion of Colloidal Silicon Dioxide, retained from the test for *Loss on Drying*, at $1000 \pm 25^\circ$ to constant weight: the previously dried Colloidal Silicon Dioxide loses NMT 2.0% of its weight.
- **ARSENIC, Method 1 (211)**
Sample solution: To 2.5 g add 50 mL of 3 N hydrochloric acid, and reflux for 30 min using a water condenser. Cool, filter with the aid of suction, and transfer the filtrate to a 100-mL volumetric flask. Wash the filter and flask with several portions of hot water, and add the washings to the flask. Cool, and dilute with water to volume.
Analysis: A 15.0-mL portion of *Sample solution*, to which 3 mL of hydrochloric acid has been added, meets the requirements of the test, the addition of the 7 N sulfuric acid being omitted.
Acceptance criteria: NMT 8 ppm

SPECIFIC TESTS

- **PH (791):** 3.5–5.5, in a (1 in 25) dispersion
- **LOSS ON DRYING (731):** Dry in a tared platinum crucible at 105° for 2 h: it loses NMT 2.5% of its weight. Retain the dried specimen in the crucible for the test for *Loss on Ignition*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Simethicone—see *Simethicone General Monographs*

Simethicone Emulsion—see *Simethicone Emulsion General Monographs*

Soda Lime

DEFINITION

Soda Lime is a mixture of Calcium Hydroxide and Sodium or Potassium Hydroxide or both. It may contain an indicator that is inert toward anesthetic gases such as Ether, Cyclopropane, and Nitrous Oxide and that changes color when the Soda Lime can no longer absorb Carbon Dioxide.

IDENTIFICATION

- **A.**
Analysis: Place a granule on a piece of moistened red litmus paper.
Acceptance criteria: The paper turns blue immediately.
- **B. IDENTIFICATION TESTS—GENERAL, Calcium (191)**
Sample solution: A solution in 6 N acetic acid
Acceptance criteria: Meets the requirements. It also imparts a yellow color to a nonluminous flame that, when viewed through cobalt glass, may show a violet color.

SPECIFIC TESTS

- **LOSS ON DRYING (731)**
Sample: 10 g
Analysis: Dry at 105° for 2 h.
Acceptance criteria: 12.0%–19.0%
- **CARBON DIOXIDE ABSORBENCY**
Analysis: Fill the lower transverse section of a U-shaped drying tube of 15-mm internal diameter and 15-cm height with loosely packed glass wool. In one arm of the tube, place 5 g of anhydrous calcium chloride, and weigh the tube and the contents. In the other arm, place 9.5–10.5 g of Soda Lime, and again weigh. Insert stoppers in the open arms of the tube, and connect the side tube of the arm filled with Soda Lime to a calcium chloride drying tube, which in turn is connected to a suitable source of supply of carbon dioxide. Pass the carbon dioxide through the tube at 75 mL/min for 20 min, accurately timed. Disconnect the tube, cool to room temperature, remove the stoppers, and weigh.
Acceptance criteria: NLT 19.0% increase in weight of the Soda Lime used for the test
- **HARDNESS**
Sample: 200 g
Analysis: Screen the *Sample* on a mechanical sieve shaker (see *Particle Size Distribution Estimation by Analytical Sieving (786)*) having a frequency of oscillation of 285 ± 3 cycles/min, for 3 min, to remove granules both coarser and finer than the labeled particle size. Weigh 50 g of the granules retained on the screen, and place them in a hardness pan that has a diameter of 200 mm and a concave brass bottom 7.9 mm thick at the circumference and 3.2 mm thick at the center, with an inside spherical radius of curvature of 109 cm. Add 15 steel balls of 7.9-mm diameter, and shake on a mechanical sieve shaker for 30 min. Remove the steel balls, brush the contents of the hardness pan onto a sieve of the fine-mesh size designated on the label, shake for 3 min on the mechanical sieve shaker, and weigh.
Acceptance criteria: NLT 75.0% of Soda Lime is retained on the screen.
- **MOISTURE ABSORPTION**
Sample: 10 g
Analysis: Place the *Sample* in a tared 50-mL weighing bottle having a diameter of 50 mm and a height of 30 mm, and weigh. Then place the bottle, with cover removed, for 24 h in a closed container in which the atmosphere is maintained at 85% relative humidity by being in equilibrium with sulfuric acid having a specific gravity of 1.16. Weigh again.
Acceptance criteria: The weight increase is NMT 7.5%.
- **PARTICLE SIZE DISTRIBUTION ESTIMATION BY ANALYTICAL SIEVING, Method I (786)**
Sample: 100 g
Analysis: Screen the *Sample* for 5 min as directed, using a mechanical shaker.
Acceptance criteria: It passes completely through a No. 2 standard-mesh sieve, and NMT 2.0% passes through a No. 40 standard-mesh sieve. NMT 7.0% is retained on the coarse-mesh sieve, and NMT 15.0% passes through the fine-mesh sieve designated on the label.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** If an indicator has been added, the name and color change of such indicator are stated on the container label. The container label also indicates the mesh size in terms of standard-mesh sieve sizes (see *Powder Fineness (811)*).

Sodium Acetate—see Sodium Acetate General Monographs

Sodium Alginate

$(C_6H_7NaO_6)_n$
 Alginic acid, sodium salt;
 Sodium alginate [9005-38-3].

DEFINITION

Sodium Alginate is the purified carbohydrate product extracted from brown seaweeds by the use of dilute alkali. It consists chiefly of the sodium salt of Alginic Acid, a polyuronic acid composed of β -D-mannuronic acid residues linked so that the carboxyl group of each unit is free while the aldehyde group is shielded by a glycosidic linkage. It contains NLT 90.8% and NMT 106.0% of sodium alginate of average equivalent weight 222.00, calculated on the dried basis.

IDENTIFICATION

- **A.**
Sample solution: A solution (1 in 100)
Analysis: To 5 mL of *Sample solution* add 1 mL of calcium chloride TS.
Acceptance criteria: A voluminous, gelatinous precipitate is formed immediately.
- **B.**
Sample solution: A solution (1 in 100)
Analysis: To 10 mL of *Sample solution* add 1 mL of 4 N sulfuric acid.
Acceptance criteria: A heavy, gelatinous precipitate is formed.

ASSAY

- **ALGINATES**
 (See *Alginates Assay* <311>.)
Sample: 250 mg
Analysis: Each mL of 0.2500 N sodium hydroxide consumed is equivalent to 27.75 mg of sodium alginate.
Acceptance criteria: 90.8%–106.0% on the dried basis

IMPURITIES

- **ARSENIC, Method II** <211> NMT 1.5 ppm
- **LEAD** <251>
Standard solution: 5 mL of *Diluted Standard Lead Solution*
Test preparation: Add 1.0 g to 20 mL of nitric acid in a 250-mL conical flask, mix, and heat carefully until the Sodium Alginate is dissolved. Continue heating until the volume is reduced to 7 mL. Cool rapidly to room temperature, transfer to a 100-mL volumetric flask, and dilute with water to volume.
Analysis: Use 50 mL of the *Test preparation*, and proceed as directed in the chapter, using 15 mL of ammonium citrate solution, 3 mL of potassium cyanide solution, and 0.5 mL of hydroxylamine hydrochloride solution. After the first dithizone extraction, wash the combined chloroform layers with 5 mL of water, discarding the water layer and continuing in the usual manner by extracting with 20 mL of 0.2 N nitric acid.
Acceptance criteria: Contains NMT 5 μ g of lead (corresponding to NMT 10 ppm)

- **HEAVY METALS, Method II** <231>
 [NOTE—Conduct the ignition in a platinum crucible, and use nitric acid in place of sulfuric acid to wet the test specimen.]
Acceptance criteria: NMT 40 ppm

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total bacterial count does not exceed 200 cfu/g, and the tests for *Salmonella* species and *Escherichia coli* are negative.
- **LOSS ON DRYING** <731>: Dry a sample at 105° for 4 h: it loses NMT 15.0% of its weight.
- **ARTICLES FOR BOTANICAL ORIGIN, Total Ash** <561>: Proceed as directed in *Methods of Analysis*, carefully igniting 3 g in a tared platinum dish, until the residue is thoroughly carbonized (5 min), and then igniting in a muffle furnace at a temperature of 800 \pm 25° until the carbon is completely burned off (approximately 75 min).
Acceptance criteria: 18.0%–27.0% of ash on the dried basis

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Sodium Ascorbate—see Sodium Ascorbate General Monographs

Sodium Benzoate

$C_7H_5NaO_2$ 144.10
 Benzoic acid, sodium salt;
 Sodium benzoate [532-32-1].

DEFINITION

Sodium Benzoate contains NLT 99.0% and NMT 100.5% of $C_7H_5NaO_2$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197M>: On the undried specimen
- **B. IDENTIFICATION TESTS—GENERAL, Sodium** <191>: Meets the requirements
- **C. IDENTIFICATION TESTS—GENERAL, Benzoate** <191>: Meets the requirements

ASSAY

- **PROCEDURE**
Sample: 600 mg
Titrimetric system
 (See *Titrimetry* <541>.)
Mode: Direct titration
Titrant: 0.1 N perchloric acid VS
Blank: 100 mL of glacial acetic acid
Endpoint detection: Visual
Analysis: To the *Sample* add 100 mL of glacial acetic acid, and stir until completely dissolved. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination. Calculate the percentage of sodium benzoate ($C_7H_5NaO_2$) in the *Sample* taken:

$$\text{Result} = [(V_s - V_b) \times N \times F] / W \times 100$$

V_s = volume of *Titrant* consumed by the *Sample* (mL)
 V_B = volume of *Titrant* consumed by the *Blank* (mL)
 N = actual normality of the *Titrant* (mEq/mL)
 F = equivalency factor, 144.1 mg/mEq
 W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–100.5% on the anhydrous basis

IMPURITIES

• HEAVY METALS <231>

Test preparation: 4.0 g in 40 mL of water

Analysis: To the *Test preparation* add dropwise with vigorous stirring 10 mL of 3 N hydrochloric acid, and filter. Use 25 mL of the filtrate.

Acceptance criteria: NMT 10 ppm

SPECIFIC TESTS

• WATER DETERMINATION, Method I <921>: NMT 1.5%

• ALKALINITY

Sample solution: 2 g in 20 mL of hot water

Analysis: To the *Sample solution* add 2 drops of phenolphthalein TS.

Acceptance criteria: The pink color produced, if any, is discharged by the addition of 0.20 mL of 0.10 N sulfuric acid.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in well-closed containers.

• USP REFERENCE STANDARDS <11>

USP Sodium Benzoate RS

Sodium Bicarbonate—see Sodium Bicarbonate General Monographs

Sodium Borate

$\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ 381.37
 $\text{Na}_2\text{B}_4\text{O}_7$ 201.22
 Borax [1303-96-4].
 Anhydrous [1330-43-4].

DEFINITION

Sodium Borate contains an amount of $\text{Na}_2\text{B}_4\text{O}_7$ equivalent to NLT 99.0% and NMT 105.0% of $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$.

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, Sodium <191>

Sample solution: 1 in 20

Acceptance criteria: Meets the requirements

• B. IDENTIFICATION TESTS—GENERAL, Borate <191>

Sample solution: 1 in 20

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: 3 g of Sodium Borate

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.5 N hydrochloric acid VS

Blank: 50 mL of water

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 50 mL of water, add methyl red TS, and titrate with 0.5 N hydrochloric acid VS. [NOTE—Heating on a steam bath may be required initially to effect solution.]

Calculate the percentage of sodium borate ($\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$) in the *Sample* taken:

$$\text{Result} = [(V - B) \times N \times F] \times 100/W$$

V = volume of *Titrant* consumed by the *Sample* (mL)

B = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 190.7 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–105.0%

IMPURITIES

• HEAVY METALS <231>

Test preparation: Dissolve 1 g in 16 mL of water and 6 mL of 1 N hydrochloric acid. Dilute with water to 25 mL.

Acceptance criteria: NMT 20 ppm

• CARBONATE AND BICARBONATE

Sample solution: To 5 mL of a solution (1 in 20), contained in a test tube, add 1 mL of 3 N hydrochloric acid.

Acceptance criteria: No effervescence is observed.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers.

Sodium Caprylate

$\text{C}_8\text{H}_{15}\text{NaO}_2$
 Sodium octanoate [1984-06-1].

166.19

DEFINITION

Sodium Caprylate contains NLT 99.0% and NMT 101.0% of sodium caprylate ($\text{C}_8\text{H}_{15}\text{NaO}_2$), calculated on the anhydrous basis.

IDENTIFICATION

• A. The retention time of the major peak of *Sample solution* A corresponds to that of the *Standard solution*, as obtained in the test for *Chromatographic Purity in Impurities*.

• B.

Methoxyphenylacetic reagent: Dissolve 2.7 g of methoxyphenylacetic acid in 6 mL of 10% tetramethylammonium hydroxide solution in methanol, and add 20 mL of alcohol. Store in a polyethylene container.

Sample solution: 20 mg

Analysis: Dissolve the *Sample* in 0.5 mL of water, add 1.5 mL of *Methoxyphenylacetic reagent*, and cool in ice water for 30 min. A voluminous, white, crystalline precipitate is formed. Place in water at 20°, and stir for 5 min. The precipitate does not disappear. Add 1 mL of ammonia TS. The precipitate dissolves completely. Add 1 mL of ammonium carbonate solution (160 mg/mL).

Acceptance criteria: No precipitate is formed.

ASSAY

• PROCEDURE

Sample: 150 mg

Blank: Glacial acetic acid

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis: Transfer the *Sample* to a 125-mL volumetric flask, and dissolve in 50 mL of glacial acetic acid. Titrate with *Titrant*. Perform a blank determination, and make

any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 16.62 mg of sodium caprylate ($\text{C}_8\text{H}_{15}\text{NaO}_2$).

Acceptance criteria: 99.0%–101.0% on the anhydrous basis

IMPURITIES

• HEAVY METALS, Method II (231)

Test preparation: Dissolve 2.0 g of Sodium Caprylate in 10 mL of glacial acetic acid, and add 10 mL of alcohol.

Standard solution: 1 mL of *Standard Lead Solution* and 9 mL of a mixture of glacial acetic acid and alcohol (1:1)

Analysis: Use 12 mL of the *Test preparation*, and proceed as directed in the chapter.

Acceptance criteria: NMT 5 µg/g

• CHROMATOGRAPHIC PURITY

Standard solution: 1.0 mg/mL of USP Caprylic Acid RS in ethyl acetate

Sample solution A: Dissolve 116 mg of Sodium Caprylate in 5 mL of water, add 1 mL of dilute sulfuric acid (1 in 35), and extract with 10 mL of ethyl acetate. Separate the organic layer, and dry it over anhydrous sodium sulfate.

Sample solution B: Dilute 1.0 mL of *Sample solution A* with ethyl acetate to 100 mL, transfer 5.0 mL of the solution obtained, and dilute with ethyl acetate to 50 mL.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-m fused silica; coated with a 0.25-µm layer of phase G25

Temperatures

Injection port: 250°

Detector: 250°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	—	100	1
100	5	220	10

Flow rate: 1.5 mL/min

Carrier gas: Helium

Injection volume: 1 µL

Injection type: Split ratio, 100:1

System suitability

Sample: *Sample solution B*

Suitability requirements

Signal-to-noise ratio: NLT 5

Analysis

Samples: *Standard solution*, *Sample solution A*, and *Sample solution B*

Disregard any peaks with an area less than half of the area of the principal peak from *Sample solution B* and any peak due to the solvent.

Calculate the percentage of each impurity in the portion of Sodium Caprylate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of the individual impurity

r_T = sum of all the peak responses

Acceptance criteria

Individual impurities: NMT 0.3%

Total impurities: NMT 0.5%

SPECIFIC TESTS

• APPEARANCE OF SOLUTION

Standard stock solution: Combine 30.0 mL of ferric chloride CS, 30.0 mL of cobaltous chloride CS, and 24.0 mL of cupric sulfate CS, and dilute with 1% (w/v) hydrochloric acid to 100.0 mL.

Standard solution: Dilute 1.0 mL of *Standard stock solution* with 1% (w/v) hydrochloric acid to 100.0 mL.

Sample solution: Dissolve 2.5 g of Sodium Caprylate in 25.0 mL of freshly boiled and cooled water.

Acceptance criteria: The *Sample solution* is clear and colorless, or not more intensely colored than the *Standard solution*.

• PH (791)

Sample solution: Use the *Sample solution* in the test for *Appearance of Solution*.

Acceptance criteria: 8.0–10.5

• WATER DETERMINATION, Method I (921): NMT 3.0%

ADDITIONAL REQUIREMENTS

• USP REFERENCE STANDARDS (11)

USP Caprylic Acid RS

Sodium Carbonate

Na_2CO_3 (anhydrous) 105.99

$\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ 124.00

Carbonic acid, disodium salt;
Disodium carbonate [497-19-8].
Monohydrate [5968-11-6].

DEFINITION

Sodium Carbonate is anhydrous or contains one molecule of water of hydration. It contains NLT 99.5% and NMT 100.5% of Na_2CO_3 , calculated on the anhydrous basis.

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL, Sodium (191):** Meets the requirements

• **B. IDENTIFICATION TESTS—GENERAL, Carbonate (191):** Meets the requirements

ASSAY

• PROCEDURE

Sample: 2 g of Sodium Carbonate, previously dried, from the test for *Water Determination*

Blank: 50 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 1 N sulfuric acid VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a flask with the aid of 50 mL of water. Add methyl red TS, and titrate with 1 N sulfuric acid VS. Add the acid slowly, with constant stirring, until the solution becomes faintly pink. Heat the solution to boiling, cool, and continue the titration. Heat again to boiling, and titrate further as necessary until the faint pink color is no longer affected by continued boiling.

Calculate the percentage of sodium carbonate (Na_2CO_3) in the *Sample* taken.

$$\text{Result} = [(V - B) \times N \times F \times 100]/W$$

V = Titrant volume consumed by the *Sample* (mL)

B = Titrant volume consumed by the *Blank* (mL)

N = Titrant actual normality (mEq/mL)

F = equivalency factor, 52.99 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.5%–100.5% on the anhydrous basis

IMPURITIES

• HEAVY METALS (231)

Test preparation: Dissolve 2.0 g in 10 mL of water.

Analysis: Add 1 drop of phenolphthalein TS to the *Test preparation*, and neutralize the solution with hydrochloric acid, added dropwise. Heat the solution to boiling, and again neutralize by the dropwise addition of hydrochloric acid. Cool, and dilute with water to 25 mL. Proceed as directed in the chapter.

Acceptance criteria: NMT 10 ppm

SPECIFIC TESTS

• WATER DETERMINATION, Method III (921)

Sample: 2 g

Analysis: Dry the *Sample* at 105° for 4 h.

Acceptance criteria: The anhydrous form loses NMT 0.5% of its weight, and the hydrous form loses 12.0%–15.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate whether it is anhydrous or hydrous.

Sodium Cetostearyl Sulfate

DEFINITION

Sodium Cetostearyl Sulfate is a mixture of sodium cetyl sulfate and sodium stearyl sulfate. It contains NLT 40.0% of sodium cetyl sulfate ($C_{16}H_{33}NaSO_4$), and the sum of the sodium cetyl sulfate content and sodium stearyl sulfate ($C_{18}H_{37}NaSO_4$) content is NLT 90.0% (both contents calculated on the anhydrous basis). It may contain a suitable buffer.

IDENTIFICATION

- **A.** The retention times of the two major peaks of *Sample solution C* correspond to those of the *System suitability solution*, as obtained in the Assay.
- **B. IDENTIFICATION TESTS—GENERAL, Sodium (191):** Meets the requirements of the flame test
- **C.**

Sample solution: 1.0 mg/mL in ethanol

Analysis: Heat 10 mL of *Sample solution* to boiling on a water bath, shaking frequently. Filter immediately, and evaporate to dryness. Dissolve the residue in 7 mL of water, add 3 mL of diluted hydrochloric acid, and evaporate the solution to half its volume. Allow to cool, and filter. To the filtrate add 1 mL of barium chloride solution (60 mg/mL).

Acceptance criteria: A white crystalline precipitate is formed.

ASSAY

• PROCEDURE

System suitability solution: 5 mg/mL each of USP Cetyl Alcohol RS and USP Stearyl Alcohol RS in alcohol

Internal standard solution: 4 mg/mL of 1-heptadecanol in alcohol

Sample solution A: Dissolve 300 mg of Sodium Cetostearyl Sulfate in 50 mL of alcohol, and add 2 mL of the *Internal standard solution* and 48 mL of water. Extract the solution with four 25-mL portions of pentane, adding 10–15 mL of saturated sodium chloride solution, if necessary, to facilitate the separation of the layers. Combine the organic layers, and reserve the hydro-alco-

holic layers for the preparation of *Sample solutions C* and *D*. Wash the organic layer with two 30-mL portions of water, dry over anhydrous sodium sulfate, and filter.

Sample solution B: Dissolve 300 mg of Sodium Cetostearyl Sulfate in 50 mL of alcohol, and add 50 mL of water. Extract the solution with four 25-mL portions of pentane, adding 10–15 mL of saturated sodium chloride solution, if necessary, to facilitate the separation of the layers. Combine the organic layers, wash with two 30-mL portions of water, dry over anhydrous sodium sulfate, and filter.

Sample solution C: Transfer 25 mL of the hydro-alcoholic solution obtained in the preparation of *Sample solution A* to a 200-mL flask that can be fitted with a reflux condenser. Add 20 mL of hydrochloric acid and 10 mL of the *Internal standard solution*, and boil under reflux for 2 h. Allow to cool. Extract with four 20-mL portions of pentane. Wash the combined organic layer with two 20-mL portions of water, dry over anhydrous sodium sulfate, and filter.

Sample solution D: Transfer 25 mL of the hydro-alcoholic solution obtained in the preparation of *Sample solution A* to a 200-mL flask that can be fitted with a reflux condenser. Add 20 mL of hydrochloric acid and 10 mL of alcohol, and boil under reflux for 2 h. Allow to cool. Extract with four 20-mL portions of pentane. Wash the combined organic layer with two 20-mL portions of water, dry over anhydrous sodium sulfate, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm \times 25-m fused silica capillary; phase G2

Temperatures

Injection port: 250°

Detector: 250°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	5	250	Duration of analysis

Injection type: Split ratio; 100:1

Injection volume: 1 μ L

Carrier gas: Nitrogen

Flow rate: 1 mL/min

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between cetyl alcohol and stearyl alcohol

Relative standard deviation: NMT 1.5%

Analysis

Correction for interference: Inject *Sample solution A* and *Sample solution B* into the chromatograph, record the chromatograms, and measure the areas for the major peaks.

If *Sample solution B* shows a peak at the same retention time as the internal standard peak of *Sample solution A*, calculate the ratio:

$$R = S_{CB}/S_I$$

S_{CB} = peak response of cetyl alcohol from *Sample solution B*

S_I = peak response with the same retention time as the internal standard of *Sample solution B*

If R is less than 300, calculate the corrected area, $S_{A(\text{corr})}$, of the peak corresponding to the internal standard of *Sample solution A*:

$$S_{A(\text{corr})} = S_{HA} - (S_I \times S_{CA}/S_{CB})$$

S_{HA} = peak response of the internal standard from *Sample solution A*

S_{CA} = peak response of cetyl alcohol from *Sample solution A*

Inject *Sample solution C* and *Sample solution D* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Carry out the *Correction for interference* in the same manner as for *Sample solution A*, and calculate the corrected area of the peak corresponding to the internal standard of *Sample solution C*, $S_{C(\text{corr})}$.

Samples: *System suitability solution*, *Sample solution C*, and *Sample solution D*

[NOTE—The substances are eluted in the following order: cetyl alcohol, 1-heptadecanol (internal standard), and stearyl alcohol. Identify the cetyl alcohol and stearyl alcohol peaks in the chromatograms of the *Sample solutions* by comparison with the *System suitability solution*.]

Calculate the percentage of sodium cetyl sulfate ($\text{C}_{16}\text{H}_{33}\text{NaSO}_4$) in the portion of Sodium Cetostearyl Sulfate taken:

$$\text{Result} = (r_C \times W_{CH}) / (S_{C(\text{corr})} \times W_C) \times F \times 100$$

r_C = peak response of cetyl alcohol from *Sample solution C*

W_{CH} = weight of the internal standard added in the preparation of *Sample solution C* (mg)

W_C = weight of Sodium Cetostearyl Sulfate taken to prepare *Sample solution C*, calculated on the anhydrous basis (mg)

F = factor, 1.421

Calculate the percentage of sodium stearyl sulfate ($\text{C}_{18}\text{H}_{37}\text{NaSO}_4$) in the portion of Sodium Cetostearyl Sulfate taken:

$$\text{Result} = B_C \times W_{CH} / (S_{C(\text{corr})} \times W_C) \times F \times 100$$

B_C = peak response of stearyl alcohol from *Sample solution C*

F = factor, 1.377

Acceptance criteria

Sodium cetyl sulfate: NLT 40.0% on the anhydrous basis

Sum of the sodium cetyl sulfate and sodium stearyl sulfate: NLT 90.0% on the anhydrous basis

IMPURITIES

• LIMIT OF SODIUM CHLORIDE AND SODIUM SULFATE

Sodium chloride

Sample: 5 g

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 50 mL of water, and add diluted nitric acid dropwise until the solution is neutral to blue litmus paper. Add 1 mL of potassium chromate TS to the *Sample solution*, and titrate with *Titrant*.

Calculate the percentage of sodium chloride (NaCl) in the Sodium Cetostearyl Sulfate taken:

$$\text{Result} = V \times N / W \times F$$

V = volume of the *Titrant* (mL)

N = actual normality of the *Titrant*

W = weight of the Sodium Cetostearyl Sulfate (g)

F = equivalence factor for sodium chloride, 5.844

Sodium sulfate

Dichloroacetic acid solution: Dilute 67 mL of dichloroacetic acid with water to 300 mL, and neutralize to blue litmus paper using ammonia TS. Cool, add 33 mL of dichloroacetic acid, and dilute with water to 600 mL.

Sample: 0.5 g

Titrimetric system

Mode: Direct titration

Titrant: 0.01 M lead nitrate VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 20 mL of water, warming gently if necessary, and add 1 mL of a solution containing 0.5 g/L of dithizone in acetone. If the solution is red, add 1 N nitric acid dropwise until a bluish-green color is obtained. To the *Sample solution* add 2.0 mL of *Dichloroacetic acid solution* and 80 mL of acetone, and titrate with *Titrant* until a persistent orange-red color is obtained.

Calculate the percentage of sodium sulfate (Na_2SO_4) in the Sodium Cetostearyl Sulfate taken:

$$\text{Result} = V \times M / W \times F$$

V = volume of *Titrant* (mL)

M = actual molarity of *Titrant*

W = weight of the Sodium Cetostearyl Sulfate (g)

F = equivalence factor for sodium sulfate, 14.20

Acceptance criteria: The sum of the percentages of sodium chloride and sodium sulfate is NMT 8.0%.

• LIMIT OF FREE CETOSTEARYL ALCOHOL

Analysis: Examine the chromatogram of *Sample solution A*, obtained as directed in the *Assay*.

Calculate the percentage of free cetostearyl alcohol in the Sodium Cetostearyl Sulfate taken:

$$\text{Result} = 100(r_A + r_B) \times W_{IS} \times (S_{A(\text{corr})} \times W)$$

r_A = peak response of the cetyl alcohol peak from *Sample solution A*

r_B = peak response of stearyl alcohol from *Sample solution A*

W_{IS} = weight of the internal standard added in the preparation of *Sample solution A* (mg)

$S_{A(\text{corr})}$ = corrected peak area corresponding to the internal standard of *Sample solution A* (see *Assay*)

W = weight of Sodium Cetostearyl Sulfate taken to prepare *Sample solution A* (mg)

Acceptance criteria: NMT 4.0%

SPECIFIC TESTS

• ACIDITY OR ALKALINITY

Sample: 500 mg

Analysis: Dissolve the *Sample* by heating in a mixture of 10 mL of water and 15 mL of 90% alcohol. Add 0.1 mL of phenolphthalein TS.

Acceptance criteria: The resulting solution is colorless. Add 0.1 mL of 0.1 N sodium hydroxide, and the resulting solution becomes red.

• WATER DETERMINATION, Method I (921): NMT 1.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

• **LABELING:** Label it to indicate the name and concentration of any added buffer.

• USP REFERENCE STANDARDS (11)

USP Cetyl Alcohol RS

USP Stearyl Alcohol RS

Sodium Dehydroacetate

$C_8H_7NaO_4$ 190.13
2*H*-Pyran-2,4(3*H*)-dione, 3-acetyl-6-methyl-, monosodium salt [4418-26-2].

DEFINITION

Sodium Dehydroacetate contains NLT 98.0% and NMT 100.5% of sodium dehydroacetate ($C_8H_7NaO_4$), calculated on the anhydrous basis.

IDENTIFICATION

• A. MELTING RANGE OR TEMPERATURE <741>

Sample solution: 150 mg/mL

Analysis: To 10 mL of the *Sample solution* add 5 mL of 3 N hydrochloric acid, collect the crystals by filtration with suction, wash with 10 mL of water, and dry at 80° for 4 h. Determine the melting point as directed in the chapter.

Acceptance criteria: 109°–111°

• B. IDENTIFICATION TESTS—GENERAL, *Sodium* <191>

Sample solution: 1 in 20

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: 500 mg

Blank: 25 mL of glacial acetic acid containing *p*-naphtholbenzein TS, which has been previously neutralized to a blue color

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 125-mL conical flask, and dissolve it in 25 mL of glacial acetic acid containing *p*-naphtholbenzein TS, which has been previously neutralized to a blue color. Titrate with 0.1 N perchloric acid VS to the original blue color. Perform a blank determination.

Calculate the percentage of dehydroacetate ($C_8H_7NaO_4$) in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = volume of the *Titrant* consumed by the *Sample* (mL)

V_B = volume of the *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 190.1 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 98.0%–100.5% on the anhydrous basis

IMPURITIES

• **HEAVY METALS**, *Method II* <231>: NMT 10 ppm

SPECIFIC TESTS

• **WATER DETERMINATION**, *Method I* <921>: 8.5%–10.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Sodium Formaldehyde Sulfoxylate

CH_3NaO_3S 118.09

$CH_3NaO_3S \cdot 2H_2O$ 154.11

Methanesulfinic acid, hydroxy-, monosodium salt; Monosodium hydroxymethanesulfinate [149-44-0]. Dihydrate [6035-47-8].

DEFINITION

Sodium Formaldehyde Sulfoxylate contains an amount of sodium formaldehyde sulfoxylate (CH_3NaO_3S) equivalent to NLT 45.5% and NMT 54.5% of SO_2 , calculated on the dried basis. It may contain a suitable stabilizer, such as sodium carbonate.

IDENTIFICATION

• A.

Sample solution: Dissolve 4 g in 10 mL of water in a test tube.

Analysis: To the *Sample solution* add 1 mL of silver–ammonia–nitrate TS.

Acceptance criteria: Metallic silver is produced, either as a finely divided, gray precipitate or as a bright metallic mirror on the inner surface of the tube.

• B.

Sample solution: Dissolve 40 mg of salicylic acid in 5 mL of sulfuric acid, and add 50 mg of Sodium Formaldehyde Sulfoxylate.

Analysis: Warm very gently.

Acceptance criteria: A permanent, deep red color appears.

ASSAY

• PROCEDURE

Sample: 1 g

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N iodine VS. [NOTE—Prepare an adequate amount for both the *Assay* and the test for *Sodium Sulfite*.]

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 50-mL volumetric flask, dissolve in 25 mL of water, and dilute with water to volume. Reserve a portion of this solution for the test for *Sodium Sulfite*. Transfer 4.0 mL of the remaining solution to a conical flask containing 100 mL of water. Titrate with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N iodine is equivalent to 1.602 mg of SO_2 .

Acceptance criteria: 45.5%–54.5% of SO_2 on the dried basis

IMPURITIES• **SULFIDE**

Analysis: Dissolve 6 g in 14 mL of water in a test tube, and wet a strip of lead acetate test paper with the clear solution.

Acceptance criteria: No discoloration is evident within 5 min.

• **IRON**

Standard solution: Dissolve 43.2 mg of ferric ammonium sulfate in 10 mL of 2 N sulfuric acid, and add water to make 1000 mL, each mL representing 5 µg of Fe.

Sample solution: Transfer 1.0 g of Sodium Formaldehyde Sulfoxylate to a suitable crucible, and carefully ignite, initially at a low temperature until thoroughly charred, and finally, preferably in a muffle furnace, at 500°–600° until the carbon is all burned off. Cool, dissolve the residue in 2 mL of hydrochloric acid, and dilute with water to 50 mL.

Analysis: To 5.0 mL of the *Standard solution* and 50 mL of the *Sample solution* add 50 mg of ammonium persulfate and 5 mL of ammonium thiocyanate TS, and transfer each to a separate color comparison tube.

Acceptance criteria: 0.0025%; the color of the *Sample* is not deeper than that of the *Standard solution*.

• **SODIUM SULFITE**

Sample solution: 4.0 mL of the solution prepared for the *Assay* in a conical flask containing 100 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N iodine VS, prepared in the *Assay*

Endpoint detection: Visual

Analysis: Add 2 mL of formaldehyde TS to the *Sample solution*, and titrate with the *Titrant*, adding 3 mL of starch TS as the endpoint is approached.

Calculate the percentage of sodium sulfite (Na₂SO₃) in the Sodium Formaldehyde Sulfoxylate taken:

$$\text{Result} = (V_2 - V_1) \times (N/W) \times (F \times 1.25)$$

V_2 = volume of 0.1 N iodine VS consumed in the titration performed in the *Assay* (mL)

V_1 = volume of 0.1 N iodine VS consumed in this titration (mL)

N = actual normality of the *Titrant* (mEq/mL)

W = weight of the *Sample* in the *Assay* (g)

F = equivalency weight of sodium sulfite, 63.02 mg/mEq

Acceptance criteria: NMT 5.0% on the dried basis

SPECIFIC TESTS• **PH (791)**

Sample solution: 20 mg/mL

Acceptance criteria: 9.5–10.5

• **LOSS ON DRYING (731)**

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 27.0%

• **ALKALINITY**

Sample solution: 1.0 g of Sodium Formaldehyde Sulfoxylate in 50 mL of water

Analysis: To the *Sample solution* add phenolphthalein TS, and titrate with 0.10 N sulfuric acid.

Acceptance criteria: NMT 3.5 mL is required for neutralization.

• **CLARITY AND COLOR OF SOLUTION**

Sample solution: 1 g of Sodium Formaldehyde Sulfoxylate in 20 mL of water

Analysis: Transfer 10 mL of the *Sample solution* to a 20- × 150-mm test tube. Compare with water in a similar test tube.

Acceptance criteria: The *Sample solution* and the water are equally clear and, when viewed transversely by

transmitted light, exhibit no apparent difference in color.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, and store at controlled room temperature.

Sodium Hydroxide

NaOH

40.00

Sodium hydroxide [1310-73-2].

DEFINITION

Sodium Hydroxide contains NLT 95.0% and NMT 100.5% of total alkali, calculated as sodium hydroxide (NaOH), including NMT 3.0% of sodium carbonate (Na₂CO₃).

[**CAUTION**—Exercise great care in handling sodium hydroxide, because it rapidly destroys tissues.]

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Sodium (191):** A solution (1 in 25) meets the requirements.

ASSAY• **PROCEDURE**

Sample solution: 1.5 g of Sodium Hydroxide in 40 mL of carbon dioxide-free water. Cool the solution to room temperature.

Blank: 40.0 mL of carbon dioxide-free water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 1 N sulfuric acid

Endpoint detection: Visual

Analysis: To the *Sample*, add phenolphthalein TS. Titrate with 1 N sulfuric acid VS. At the discharge of the pink color of the indicator, record the volume of *Titrant* (V_{S1}). Add methyl orange TS, and continue the titration until a persistent pink color is produced. Record the volume of *Titrant* (V_{S2}). Perform a blank determination, and make any necessary corrections.

Calculate the percentage of total alkali, calculated as sodium hydroxide (NaOH), in the *Sample* taken:

$$\text{Result} = \{[(V_{S1} - V_B) \times N \times F_1]/W\} \times 100$$

V_{S1} = volume of *Titrant* consumed by the *Sample* to the first endpoint (mL)

V_B = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F_1 = equivalency factor, 40.00 (mg/mEq)

W = weight of the *Sample* (mg)

Calculate the percentage of sodium carbonate (Na₂CO₃) in the *Sample* taken:

$$\text{Result} = \{[(V_{S2} - V_{S1}) \times N \times F_2]/W\} \times 100$$

V_{S2} = volume of *Titrant* consumed by the *Sample* to the second endpoint (mL)

V_{S1} = volume of *Titrant* consumed by the *Sample* to the first endpoint (mL)

N = actual normality of the *Titrant* (mEq/mL)

F_2 = equivalency factor, 106.0 (mg/mEq)

W = weight of the *Sample* (mg)

Acceptance criteria: 95.0%–100.5% of total alkali; NMT 3.0% of sodium carbonate (Na₂CO₃)

IMPURITIES• **POTASSIUM**

Sample solution: 1 in 20

Analysis: Acidify 5 mL of the *Sample solution* with 6 N acetic acid, then add 5 drops of sodium cobaltinitrite TS.

Acceptance criteria: No precipitate is formed.

• **HEAVY METALS** (231)

Test preparation: Dissolve 0.67 g in a mixture of 5 mL of water and 7 mL of 3 N hydrochloric acid. Heat to boiling, cool, and dilute with water to 25 mL.

Analysis: Proceed as directed in the chapter.

Acceptance criteria: NMT 30 ppm

SPECIFIC TESTS

- **INSOLUBLE SUBSTANCES AND ORGANIC MATTER:** A solution (1 in 20) is complete, clear, and colorless to slightly colored.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Sodium Lauryl Sulfate

Sulfuric acid monododecyl ester sodium salt;
Sodium monododecyl sulfate [151-21-3].

DEFINITION

Sodium Lauryl Sulfate is a mixture of sodium alkyl sulfates consisting chiefly of sodium lauryl sulfate [$\text{CH}_3(\text{CH}_2)_{10}\text{CH}_2\text{OSO}_3\text{Na}$]. The combined content of sodium chloride and sodium sulfate is NMT 8.0%.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Sodium (191):** Ignite 500 mg at 800° until the carbon is consumed. The residue dissolved in 10 mL of water meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL, Sulfate (191):** A solution (1 in 10), after acidification with hydrochloric acid and gentle boiling for 20 min, meets the requirements.

IMPURITIES**Inorganic Impurities**

- **HEAVY METALS, Method II (231):** 20 ppm
- **SODIUM CHLORIDE**

Sample solution: 100 mg/mL in water

Analysis: Neutralize 50 mL of *Sample solution* with 0.8 N nitric acid, using litmus paper as the indicator. Add 2 mL of potassium chromate TS, and titrate with 0.1 N silver nitrate VS. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

SPECIFIC TESTS• **SODIUM SULFATE**

Lead nitrate solution: 33.1 g/L of lead nitrate in water

Analysis: Transfer 1 g of Sodium Lauryl Sulfate, weighed, to a 250-mL beaker. Add 35 mL of water, and warm to dissolve. To the warm solution add 2.0 mL of 1 N nitric acid, mix, and add 50 mL of alcohol. Heat the solution to boiling, and slowly add 10 mL of *Lead nitrate solution*, with stirring. Cover the beaker, simmer for 5 min, and allow to settle. If the supernatant is hazy, allow to stand for 10 min, heat to boiling, and allow to settle. When the solution is almost to the boiling point, decant as much liquid as possible through 9-cm filter paper (Whatman No. 41 or equivalent). Wash four times by decantation, each time using 50 mL of 50% alcohol, and bring the mixture to a boil. Transfer the filter paper to the original beaker, and immediately add 30 mL of water, 20.0 mL of 0.05 M edetate disodium VS, and 1 mL of ammonia-ammonium chloride buffer TS. Warm to dissolve the precipitate, add 0.2 mL of eriochrome black TS, and titrate with 0.05 M

zinc sulfate VS. Each mL of 0.05 M edetate disodium is equivalent to 7.102 mg of Na_2SO_4 .

Acceptance criteria: NMT 8.0% of the combined content of sodium chloride and sodium sulfate

• **ALKALINITY**

Sample solution: Dissolve 1.0 g in 100 mL of water, add phenol red TS, and titrate with 0.10 N hydrochloric acid.

Acceptance criteria: NMT 0.60 mL for neutralization

- **TOTAL ALCOHOLS:** Transfer 5 g to an 800-mL Kjeldahl flask, and add 150 mL of water, 50 mL of hydrochloric acid, and a few boiling chips. Attach a reflux condenser to the Kjeldahl flask, heat carefully to avoid excessive frothing, and boil for 4 h. Cool the flask, rinse the condenser with ether, collecting the ether in the flask, and transfer the contents to a 500-mL separator, rinsing the flask twice with ether and adding the washings to the separator. Extract the solution with two 75-mL portions of ether, evaporate the combined ether extracts in a tared beaker on a steam bath, dry the residue at 105° for 30 min, cool, and weigh.

Acceptance criteria: The residue represents the total alcohols and is NLT 59.0% of the weight of Sodium Lauryl Sulfate taken.

• **UNSULFATED ALCOHOLS**

Sample solution: Dissolve 10 g in 100 mL of water, and add 100 mL of alcohol.

Analysis: Transfer the solution to a separator, and extract with three 50-mL portions of solvent hexane. If an emulsion forms, sodium chloride may be added to promote separation of the two layers. Wash the combined solvent hexane extracts with three 50-mL portions of water, and dry with anhydrous sodium sulfate. Filter the solvent hexane extract into a tared beaker, evaporate on a steam bath until the odor of solvent hexane no longer is perceptible, dry the residue at 105° for 30 min, cool, and weigh.

Acceptance criteria: The weight of the residue is NMT 4.0% of the weight of Sodium Lauryl Sulfate taken.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Sodium Metabisulfite

$\text{Na}_2\text{S}_2\text{O}_5$

190.11

Disulfurous acid, disodium salt;
Disodium pyrosulfite [7681-57-4].

DEFINITION

Sodium Metabisulfite contains an amount of sodium metabisulfite ($\text{Na}_2\text{S}_2\text{O}_5$) equivalent to NLT 65.0% and NMT 67.4% of SO_2 .

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Sodium (191) and Sulfite (191):** A solution (1 in 20) meets the requirements.

ASSAY• **PROCEDURE**

Sample: 200 mg of Sodium Metabisulfite

Blank: 50.0 mL of 0.1 N iodine VS, accurately measured

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N iodine VS

Back-titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Add the *Sample* to 50.0 mL of 0.1 N iodine VS in a glass-stoppered conical flask, and swirl to dissolve.

Allow to stand for 5 min, protected from light. Add

1 mL of hydrochloric acid, and titrate the excess iodine with *Back-titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform a blank determination. Calculate the percentage of sodium metabisulfite ($\text{Na}_2\text{S}_2\text{O}_5$) in the portion of Sodium Metabisulfite taken:

$$\text{Result} = \{[(V_B - V_S) \times N \times F]/W\} \times 100$$

V_B = *Back-titrant* volume consumed by the *Blank* (mL)

V_S = *Back-titrant* volume consumed by the *Sample* (mL)

N = *Back-titrant* normality (mEq/mL)

F = equivalency factor, 32.03 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 65.0%–67.4% of SO_2

IMPURITIES

• **HEAVY METALS**, *Method I* (231)

Test preparation: 1 g

Analysis: Dissolve the *Test preparation* in 10 mL water. Add 5 mL of hydrochloric acid, evaporate on a steam bath to dryness, and dissolve the residue in 25 mL of water.

Acceptance criteria: NMT 20 ppm

• **LIMIT OF CHLORIDE**

Standard solution: 0.71 mL of 0.020 N hydrochloric acid in 100 mL of water

Sample solution: 1.0 g in 10 mL of water. [NOTE—Pass through a small chloride-free filter, if necessary.] Add 6 mL of 30% hydrogen peroxide. Add 1 N sodium hydroxide until the solution is slightly alkaline to phenolphthalein, and dilute with water to 100 mL.

Analysis

Samples: *Standard solution* and *Sample solution*
Dilute 2.0 mL of the *Samples* with water to 20 mL. Add 1 mL of nitric acid and 1 mL of silver nitrate TS. Allow to stand for 5 min protected from direct sunlight, and compare the turbidity from the *Samples* (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*).

Acceptance criteria: Any turbidity produced by the *Sample solution* does not exceed that of the *Standard solution* (0.05%).

• **LIMIT OF THIOSULFATE**

Standard solution: Mix 0.10 mL of 0.10 N sodium thiosulfate with 10 mL of 1 N hydrochloric acid.

Sample solution: Mix 2.2 g with 10 mL of 1 N hydrochloric acid.

Analysis

Samples: *Standard solution* and *Sample solution*
Gently boil the *Samples* for 5 min. Cool, then transfer each solution to a small test tube.

Acceptance criteria: Any turbidity produced by the *Sample solution* does not exceed that of the *Standard solution* (0.05%).

• **IRON** (241)

Test preparation: Dissolve 500 mg of Sodium Metabisulfite in 14 mL of dilute hydrochloric acid (2 in 7), and evaporate on a steam bath to dryness. Dissolve the residue in 7 mL of dilute hydrochloric acid (2 in 7), and again evaporate to dryness. Dissolve the resulting residue in a mixture of 2 mL of hydrochloric acid and 20 mL of water. Add 3 drops of bromine TS, and boil to expel the bromine. Cool, then dilute with water to 47 mL.

Analysis: Proceed as directed in the chapter.

Acceptance criteria: NMT 20 ppm

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-filled, tight containers, and avoid exposure to excessive heat.

Sodium Phosphate, Dibasic—see *Dibasic Sodium Phosphate General Monographs*

Sodium Phosphate, Monobasic—see *Monobasic Sodium Phosphate General Monographs*

Tribasic Sodium Phosphate

Na_3PO_4 (anhydrous)	163.94
Trisodium phosphate, monohydrate	181.96
Phosphoric acid, trisodium salt, dodecahydrate;	
Trisodium phosphate, dodecahydrate	380.13
[10101-89-0].	
Anhydrous [7601-54-9].	

DEFINITION

Tribasic Sodium Phosphate is anhydrous or contains one to twelve molecules of water of hydration. Na_3PO_4 (anhydrous) and $\text{Na}_3\text{PO}_4 \cdot \text{H}_2\text{O}$ (monohydrate) contain NLT 97.0% of Na_3PO_4 , calculated on the ignited basis. $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$ (dodecahydrate) contains NLT 92.0% of Na_3PO_4 , calculated on the ignited basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL**, *Sodium* (191) and *Phosphate* (191): A solution (1 in 20) meets the requirements.

ASSAY

• **PROCEDURE**

Sample: 5.5 g of Tribasic Sodium Phosphate, on the anhydrous basis

Blank: 100.0 mL of 1 N hydrochloric acid, accurately measured

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 1 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis: Transfer the *Blank* to a 400-mL beaker, and titrate with the *Titrant* to the endpoint at a pH of 7.0. Record as the volume consumed, and designate as A. Transfer the *Sample* to a 400-mL beaker, add 100.0 mL of 1 N hydrochloric acid, and stir until dissolved. Pass a stream of carbon dioxide-free air, in fine bubbles, through the solution for 30 min to expel carbon dioxide, covering the beaker loosely to prevent any loss by spraying. Wash the cover and sides of the beaker with a few mL of water.

Titrate the excess acid potentiometrically with the *Titrant* to the inflection point at a pH of 4. Record the buret reading, and designate as B. Protect the solution from carbon dioxide absorbed from the air, and continue the titration with 1 N sodium hydroxide VS to the inflection point at a pH of 8.8. Record the buret reading, and designate as C.

Calculate the amount of *Titrant* consumed by the *Sample* to the first inflection point, correcting for the *Blank* ($V_1 = A - B$) and the amount of *Titrant* consumed by the *Sample* between the two inflection points ($V_2 = C - B$). If V_1 is equal to or greater than $2V_2$, calculate the amount of Na_3PO_4 in the portion of *Sample* taken:

$$D = V_2 \times N \times F$$

V_2 = volume of *Titrant* consumed between the two inflection points (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 163.9 mg/mEq

If V_1 is less than $2V_2$, calculate the amount of Na_3PO_4 in the portion of *Sample* taken:

$$D = (V_1 - V_2) \times N \times F$$

V_1 = volume of the *Titrant* consumed to the first inflection point, correcting for the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 163.9 mg/mEq

Calculate the percentage of Na_3PO_4 on the ignited basis in the portion of Tribasic Sodium Phosphate taken:

$$\text{Result} = [10/(100 - L)] \times (D/W)$$

L = percentage calculated in the test for *Loss on Ignition* (733)

D = amount of Na_3PO_4 found (mg)

W = weight of the *Sample* (g)

Acceptance criteria: NLT 97.0% of Na_3PO_4 on the ignited basis. $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$ (dodecahydrate) contains NLT 92.0% of Na_3PO_4 on the ignited basis.

IMPURITIES

• LOSS ON IGNITION (733)

Sample: 2 g

Analysis: Dry the *Sample* at 110° for 5 h, and then ignite at 800° for 30 min.

Acceptance criteria: The anhydrous form loses NMT 2.0% of its weight, the monohydrate loses 8.0%–11.0% of its weight, and the dodecahydrate loses 45.0%–57.0% of its weight.

• ARSENIC, Method I (211)

Test preparation: Dissolve a portion equivalent to 1.0 g of anhydrous tribasic sodium phosphate in 35 mL of water.

Analysis: Proceed as directed in the chapter.

Acceptance criteria: NMT 3 ppm

• HEAVY METALS, Method I (231)

Test preparation: Dissolve a portion equivalent to 2.0 g of anhydrous tribasic sodium phosphate in 25 mL of water.

Analysis: Proceed as directed in the chapter.

Acceptance criteria: 10 ppm

SPECIFIC TESTS

• INSOLUBLE SUBSTANCES

Sample solution: Dissolve a portion equivalent to 10.0 g of anhydrous tribasic sodium phosphate in 100 mL of hot water.

Analysis: Filter the *Sample solution* through a tared filtering crucible. [NOTE—Do not use glass.] Wash the insoluble residue with hot water, and dry at 105° for 2 h.

Acceptance criteria: The weight of the residue so obtained does not exceed 20 mg (0.2%).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.

• **LABELING:** Label it to indicate whether it is anhydrous, the monohydrate, or the dodecahydrate.

Sodium Propionate

$\text{C}_3\text{H}_5\text{NaO}_2 \cdot x\text{H}_2\text{O}$

$\text{C}_3\text{H}_5\text{NaO}_2$

96.06

Propanoic acid, sodium salt, hydrate;
Sodium propionate hydrate [6700-17-0].
Anhydrous [137-40-6].

DEFINITION

Sodium Propionate, dried at 105° for 2 h, contains NLT 99.0% and NMT 100.5% of sodium propionate ($\text{C}_3\text{H}_5\text{NaO}_2$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Analysis: Perform test on an undried sample.

Acceptance criteria: Meets the requirements

• B. IDENTIFICATION TESTS—GENERAL, Sodium (191)

Sample solution: 1 in 20

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: 200 mg of Sodium Propionate, previously dried at 105° for 2 h

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Blank: 50 mL of glacial acetic acid

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 50 mL of glacial acetic acid, and add 1 drop of crystal violet TS. Titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction.

Calculate the percentage of sodium propionate ($\text{C}_3\text{H}_5\text{NaO}_2$) in the *Sample* taken:

$$\text{Result} = [(V_S - V_B) \times N \times F \times 100]/W$$

V_S = volume of the *Titrant* consumed by the *Sample* (mL)

V_B = volume of the *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 96.06 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES

• HEAVY METALS, Method I (231)

Test preparation: Dissolve 2 g of Sodium Propionate in 1 mL of 1 N acetic acid and sufficient water to make 25 mL.

Acceptance criteria: NMT 10 ppm

SPECIFIC TESTS

• WATER DETERMINATION, Method I (921): NMT 1.0%

• ALKALINITY

Sample solution: 2.0 g of Sodium Propionate in 20 mL of water

Analysis: Add phenolphthalein TS to the *Sample solution*.

Acceptance criteria: If a pink color is produced, it is discharged by 0.60 mL of 0.10 N sulfuric acid.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
USP Sodium Propionate RS

Sodium Starch Glycolate

Starch carboxymethyl ether, sodium salt.

DEFINITION

Sodium Starch Glycolate is the sodium salt of a carboxymethyl ether of starch or of a cross-linked carboxymethyl ether of starch. It may contain NMT 7.0% of Sodium Chloride. The pH and assay requirements for Type A and Type B are set forth in the accompanying table.

Type	pH		% Sodium, Combined as Sodium Starch Glycolate	
	Min.	Max.	Min.	Max.
A	5.5	7.5	2.8	4.2
B	3.0	5.0	2.0	3.4

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** A slightly acidified solution is colored blue to violet by the addition of iodine and potassium iodide TS 1.
- **C. PROCEDURE**
Potassium pyroantimonate solution: To 2 g of potassium pyroantimonate add 100 mL of water. Boil the solution for 5 min, cool quickly, and add 10 mL of a solution of potassium hydroxide (3 in 20). Allow to stand for 24 h, and filter.
Analysis: To a 2-mL portion of the *Sample solution* prepared for the test for *Limit of Iron*, add 4 mL of *Potassium pyroantimonate solution*. If necessary, rub the inside of the test tube with a glass rod.
Acceptance criteria: A white, crystalline precipitate is formed.
- **D.** Sodium Starch Glycolate imparts an intense yellow color to a nonluminous flame.

ASSAY**• PROCEDURE**

Sample: 1 g

Analysis: Transfer the *Sample* to a conical flask, add 20 mL of 80% alcohol, stir for 10 min, and filter. Repeat the extraction until the chloride has been completely extracted, as shown by a test with silver nitrate. Dry the insoluble portion at 105° to constant weight, and transfer an accurately weighed portion (700 mg) of the dried 80% alcohol-insoluble portion to a suitable flask. Add 80 mL of glacial acetic acid, heat the mixture under reflux on a boiling water bath for 2 h, cool to room temperature, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically.

Calculate the percentage of sodium combined in the form of sodium starch glycolate:

$$\text{Result} = 100 \times (22.99) \times V \times N/W$$

V = volume of perchloric acid consumed (mL)

N = normality of the perchloric acid

W = weight of the dried alcohol-insoluble residue taken for the Assay (mg)

Acceptance criteria: 2.8%–4.2% for Type A;
2.0%–3.4% for Type B

OTHER COMPONENTS**• LIMIT OF SODIUM CHLORIDE**

Sample: 500 mg of Sodium Starch Glycolate

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Potentiometric

Indicator electrode: Suitable silver-based

Reference electrode: Double junction electrode containing a 10% potassium nitrate filling solution in the outer jacket and a standard filling solution in the inner jacket

Analysis: Transfer the *Sample* to a beaker, and suspend in 100 mL of water. Add 1 mL of nitric acid. Titrate with the *Titrant*. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride.

Acceptance criteria: NMT 7.0%

• LIMIT OF SODIUM GLYCOLATE

[NOTE—Conduct this test without exposure to daylight. Use low-actinic glassware.]

Solution A: 0.1 mg/mL of 2,7-dihydroxynaphthalene in sulfuric acid; allow to stand until decolorized, and use within 2 days.

Standard solution: Transfer 310 mg of glycolic acid, previously dried over phosphorus pentoxide in a desiccator at room temperature overnight, to a 500-mL volumetric flask, and dissolve in and dilute with water to volume. Transfer 5.0 mL of this solution to a 100-mL beaker, add 4 mL of 6 N acetic acid, and allow to stand for about 30 min. Add 50 mL of acetone and 1 g of sodium chloride, mix, and pass through fast filter paper moistened with acetone into a 100-mL volumetric flask. Rinse the beaker and the filter paper with acetone. Combine the filtrate and washings, dilute with acetone to volume, and mix. Allow to stand for 24 h without shaking. Use the clear supernatant as the *Standard solution*.

Sample solution: Transfer 200 mg to a 100-mL beaker. Add 4 mL of 6 N acetic acid and 5 mL of water. Stir until dissolution is complete (about 10 min). Add 50 mL of acetone and 1 g of sodium chloride, and pass through fast filter paper moistened with acetone into a 100-mL volumetric flask. Rinse the beaker and filter paper with acetone. Combine the filtrate and washings, and dilute with acetone to volume. Allow to stand for 24 h without shaking. Use the clear supernatant as the *Sample solution*.

Analysis: Treat the *Sample solution* and the *Standard solution* as follows. Heat 2.0 mL of the solution on a water bath for 20 min to remove the acetone. Cool to room temperature. Add 20.0 mL of *Solution A* to the solution under test, mix, and heat on a water bath for 20 min. Cool under running water, and quantitatively transfer to a 25-mL volumetric flask. Maintain the flask under running water, and dilute with sulfuric acid to volume. Within 10 min, determine the absorbance of the solution at 540 nm with a suitable spectrophotometer, using water as the blank.

Acceptance criteria: The absorbance of the *Sample solution* is NMT that of the *Standard solution* (2.0%).

IMPURITIES**Inorganic Impurities**

- **HEAVY METALS, Method II** (231): 20 ppm

• LIMIT OF IRON

Standard solution: Dissolve 863.4 mg of ferric ammonium sulfate $[\text{FeNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}]$ in water, add 25 mL of 2 N sulfuric acid, dilute with water to 500.0 mL, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains the equivalent of 1.0 µg/mL of iron.

Sample solution: Place 2.5 g in a silica or platinum crucible, and add 2 mL of 10 N sulfuric acid. Heat on a water bath, then cautiously raise the temperature progressively over an open flame. Ignite, preferably in a muffle furnace, at $600 \pm 25^\circ$. Continue heating until all black particles have disappeared. Cool, add a few drops of 2 N sulfuric acid, and heat and ignite as above. Add a few drops of 2 M ammonium carbonate, evaporate to dryness, and ignite as above. Cool, dissolve the residue in 50 mL of water, and mix.

[NOTE—Reserve a portion of this solution for Identification test C.]

Analysis: Treat the *Sample solution* and the *Standard solution* as follows. Transfer 10 mL of the solution to a suitable beaker, add 2 mL of citric acid solution (1 in 5) and 0.1 mL of thioglycolic acid, and mix. Render the solution alkaline, using litmus paper as an external indicator, by the addition of ammonium hydroxide. Dilute with water to 20 mL, and mix. Allow the solutions to stand for 5 min.

Acceptance criteria: The color of the solution from the *Sample solution* is a shade of pink no deeper than that of the solution from the *Standard solution* (0.002%).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **pH** (791): Disperse 1 g in 30 mL of water. The pH of the resulting suspension is either 5.5–7.5 for Type A or 3.0–5.0 for Type B.
- **LOSS ON DRYING** (731): Dry a sample at 130° for 90 min: it loses NMT 10.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, preferably protected from wide variations in temperature and humidity, which may cause caking.
- **LABELING:** Label it to indicate the botanical source of the starch from which it was derived, the cross-linking agent (if used), the pH range, and whether it is Type A or Type B.
- **USP REFERENCE STANDARDS** (11)
USP Sodium Starch Glycolate Type A RS
USP Sodium Starch Glycolate Type B RS

Sodium Stearate

Octadecanoic acid, sodium salt;
Sodium stearate [822-16-2].

DEFINITION

Sodium Stearate is a mixture of sodium stearate ($C_{18}H_{35}NaO_2$) and sodium palmitate ($C_{16}H_{31}NaO_2$), which together constitute NLT 90.0% of the total content. The content of $C_{18}H_{35}NaO_2$ is NLT 40.0% of the total. Sodium stearate contains small amounts of the sodium salts of other fatty acids.

IDENTIFICATION

- **A.** When heated, it fuses. At a high temperature it decomposes, emitting flammable vapors and the odor of burning fat, finally leaving a residue that, when moistened with water, is alkaline to litmus paper, effervesces with acids, and colors a nonluminous flame intensely yellow.
- **B.**

Sample: 25 g

Analysis: Dissolve the *Sample* in 300 mL of hot water, add 60 mL of 2 N sulfuric acid, and heat the solution, with frequent stirring, until the separated fatty acid layer is clear. Wash the fatty acids with boiling water

until they are free from sulfate, collect in a small beaker, and warm on a steam bath until the water has settled and the fatty acids are clear. Allow the acids to cool, pour off the water layer, then melt the acids, filter into a dry beaker while hot, and dry at 105° for 20 min.

Acceptance criteria: The solidification temperature of the fatty acids is NLT 54° .

ASSAY

• PROCEDURE

Standard solution: Transfer 50 mg of USP Stearic Acid RS and 50 mg of USP Palmitic Acid RS into a small conical flask fitted with a suitable reflux attachment. Add 5.0 mL of a solution prepared by dissolving 14 g of boron trifluoride in methanol to make 100 mL; swirl and reflux for 15 min or until the solid is dissolved. Cool, transfer the reaction mixture with the aid of 10 mL of chromatographic solvent hexane to a 60-mL separator, and add 10 mL of water and 10 mL of saturated sodium chloride solution. Shake, allow to separate, then drain and discard the lower, aqueous layer. Pass the hexane layer through 6 g of anhydrous sodium sulfate (previously washed with chromatographic solvent hexane) into a suitable flask.

Sample solution: Transfer 100 mg of Sodium Stearate into a small conical flask fitted with a suitable reflux attachment. Add 5.0 mL of a solution prepared by dissolving 14 g of boron trifluoride in methanol to make 100 mL; swirl and reflux for 15 min or until the solid is dissolved. Cool, transfer the reaction mixture with the aid of 10 mL of chromatographic solvent hexane to a 60-mL separator, and add 10 mL of water and 10 mL of saturated sodium chloride solution. Shake, allow to separate, then drain and discard the lower, aqueous layer. Pass the hexane layer through 6 g of anhydrous sodium sulfate (previously washed with chromatographic solvent hexane) into a suitable flask.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 1.5-m \times 3-mm, preferably glass; packed with 15% G4 on support S1A

Carrier gas: Helium, passed through a bed of molecular sieve for drying, if necessary.

Injection volume: 1–2 μ L

Temperatures

Injection port: 210°

Detector: 210°

Column: 165°

System suitability

Samples: *Standard solution* and *Sample solution*

Suitability requirements

Resolution: NLT 2.0 between methyl palmitate and methyl stearate, *Sample solution*

[NOTE—Locate the peaks by comparison with the chromatogram from the *Standard solution*.]

Relative standard deviation: NMT 1.5% for methyl stearate and methyl palmitate for five replicate injections of the *Sample solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of sodium stearate

($C_{18}H_{35}NaO_2$) in the portion of Sodium Stearate taken:

$$\text{Result} = (A/B) \times 100$$

A = peak area due to methyl stearate

B = sum of the peak areas of all the fatty acid esters

Calculate the percentage of sodium palmitate

($C_{16}H_{31}NaO_2$) in the portion of Sodium Stearate taken:

$$\text{Result} = (A/B) \times 100$$

- A = peak area due to methyl palmitate
 B = sum of the peak areas of all the fatty acid esters

Acceptance criteria

Sodium stearate: NLT 40.0%

Sum of sodium stearate and sodium palmitate:
 NLT 90.0%

SPECIFIC TESTS• **ACIDITY**

Sample solution: Heat 50 mL of alcohol to the same temperature, $\pm 5^\circ$, as that attained when the pink endpoint is reached in the titration of the sample specimen. Add 3 drops of phenolphthalein TS and sufficient 0.020 N sodium hydroxide to produce a faint pink color. Add 2.00 g of Sodium Stearate, and dissolve with the aid of a small amount of heat: no pink color is produced.

Analysis: Titrate the solution with 0.020 N sodium hydroxide until a pink color is produced.

Acceptance criteria: 1.00–4.25 mL of 0.020 N sodium hydroxide is required (0.28%–1.2% as stearic acid).

• **LOSS ON DRYING (731)**

Sample: Tare a beaker containing 1 g of washed sand, previously dried at 105° , add 500 mg of Sodium Stearate, and again weigh.

Analysis: To the *Sample* add 10 mL of alcohol and evaporate at 80° to dryness, and dry at 105° for 4 h.

Acceptance criteria: NMT 5.0%

• **FATS AND FIXED OILS, Acid Value of Fatty Acids (401)**

Sample: 1 g of the fatty acids obtained in *Identification* test B

Acceptance criteria: 196–211

• **FATS AND FIXED OILS, Iodine Value of Fatty Acids (401)**

Sample: The fatty acids obtained in *Identification* test B

Acceptance criteria: NMT 4.0

• **ALCOHOL-INSOLUBLE SUBSTANCES**

Sample solution: Reflux 1.0 g with 25 mL of alcohol.

Analysis: It dissolves completely, and the resulting solution is clear or NMT slightly opalescent.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS (11)**
 USP Palmitic Acid RS
 USP Stearic Acid RS

Sodium Stearyl Fumarate

DEFINITION

Sodium Stearyl Fumarate contains NLT 99.0% and NMT 101.5% of sodium stearyl fumarate ($C_{22}H_{39}NaO_4$), calculated on the anhydrous basis.

IDENTIFICATION• **INFRARED ABSORPTION (197K)**

Analysis: Perform test on an undried specimen (1 in 300).

Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Sample: 250 mg

Blank: 10 mL of chloroform

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 50-mL conical flask, mix with 10 mL of chloroform, and add 20 mL of glacial acetic acid to dissolve. Add quinaldine red TS, and titrate with 0.1 N perchloric acid VS.

Calculate the percentage of sodium stearyl fumarate ($C_{22}H_{39}NaO_4$) in the *Sample* taken:

$$\text{Result} = \{(V_s - V_b) \times N \times F / W\} \times 100$$

V_s = volume of *Titrant* consumed by the *Sample* (mL)

V_b = volume of *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 390.5 mg/mEq

W = weight of the *Sample* (mg)

Acceptance criteria: 99.0%–101.5% on the anhydrous basis

OTHER COMPONENTS• **LIMIT OF SODIUM STEARYL MALEATE AND STEARYL ALCOHOL**

Solvent: Chloroform and glacial acetic acid (4:1)

Standard monostearyl maleate stock solution:

1 mg/mL of USP Monostearyl Maleate RS in *Solvent*

Standard monostearyl maleate solution: Pipet 5.0 mL of *Standard monostearyl maleate stock solution*, and dilute with chloroform to 50 mL.

Standard stearyl alcohol stock solution: 1 mg/mL of USP Stearyl Alcohol RS in *Solvent*

Standard stearyl alcohol solution: Pipet 5.0 mL of *Standard stearyl alcohol stock solution*, and dilute with chloroform to 50 mL.

Sample solution: Transfer 200 mg of Sodium Stearyl Fumarate to a small, glass-stoppered conical flask. Add 10.0 mL of *Solvent*. Dissolve by placing the flask in an ultrasonic bath for 10 min.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel (TLC plates)

Spray reagent: Sulfuric acid and alcohol (1:9).

[NOTE—Add cautiously and with stirring.]

Developing solvent system: Hexanes, toluene, and glacial acetic acid (5:5:1)

Analysis

Samples: *Standard monostearyl maleate solution*, *Standard stearyl alcohol solution*, and *Sample solution*
 Apply 5 μ L of *Standard monostearyl maleate solution* and 10 μ L each of *Standard stearyl alcohol solution* and *Sample solution* to the plate. Immerse the plate in a tank containing a layer of 10 mm of chloroform on the bottom. Allow the solvent front to reach the upper edge of the spots. Withdraw the plate, and dry in a current of cold air. Repeat the immersion, development, and drying. This results in spots having a linear shape. Develop the chromatograph in a saturated chamber containing the *Developing solvent system* until the solvent front has moved 15 cm, and remove the plate from the chamber. Allow to dry for 10 min, and heat in an oven at 90° for 2 min. Allow to cool to room temperature. Replace the plate in the chamber for another 15-cm development, remove the plate, and allow to dry at room temperature for 15 min. Spray the plate with *Spray reagent*. Dry the plate in an oven at 150° for 15 min. Dark spots appear on a light background. Allow to cool. Faint spots at an R_f value of 0.9 may result from traces of distearyl maleate and distearyl fumarate.

Acceptance criteria: The intensity of any spot from the *Sample solution* is not greater than that from the corresponding spot from the *Standard monostearyl maleate solution* and *Standard stearyl alcohol solution*

(NMT 0.25% sodium stearyl maleate, NMT 0.5% stearyl alcohol).

IMPURITIES

- **LEAD** (251): NMT 10 ppm
- **HEAVY METALS**, *Method II* (231): NMT 20 ppm

SPECIFIC TESTS

- **WATER DETERMINATION**, *Method I* (921): NMT 5.0%

Change to read:

- **FATS AND FIXED OILS**, *Saponification Value* (401)

Sample: 450 mg

Ethanol potassium hydroxide: Dissolve 5.5 g of potassium hydroxide in absolute alcohol, heating if necessary to dissolve, and dilute with absolute alcohol to about 1000 mL. Prepare fresh daily, and filter if necessary to remove carbonate.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N hydrochloric acid VS

Blank: 50.0 mL of *Ethanol potassium hydroxide*

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 300-mL conical flask, and add 50.0 mL of *Ethanol potassium hydroxide*, rinsing down the inside of the flask during the addition. Gently reflux the mixture on a steam bath for NLT 2 h, occasionally swirl gently, but avoid splashing the mixture up into the condenser. Rinse the condenser with two 10-mL portions of 70% alcohol, add phenolphthalein TS, and titrate with 0.1 N hydrochloric acid VS to the disappearance of any pink color. Perform a blank determination.

Calculate the *Saponification Value* for Sodium Stearyl Fumarate in the *Sample* taken:

$$\bullet \text{Result} = [(V_B - V_S) \times N \times F] / W$$

V_B = volume of the *Titrant* consumed by the *Blank* (mL)

V_S = volume of the *Titrant* consumed by the *Sample* (mL) • (ERR 1-May-2012)

N = actual normality of the *Titrant* (mEq/mL)

F = molecular weight of potassium hydroxide, 56.11

W = weight of the *Sample* (g)

Acceptance criteria: 142.2–146.0, calculated on the anhydrous basis

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
 - USP Monostearyl Maleate RS
 - USP Sodium Stearyl Fumarate RS
 - USP Stearyl Alcohol RS

Sodium Sulfite

Na_2SO_3 126.04
[7757-83-7].

DEFINITION

Sodium Sulfite contains NLT 95.0% and NMT 100.5% of sodium sulfite (Na_2SO_3).

IDENTIFICATION

- **A.**

Sample solution: 50 mg/mL of Sodium Sulfite. [NOTE—Reserve portions of the solution so obtained for use in

Identification test B and in the test for *Color and Clarity of Solution*.]

Analysis: Add a drop of phenolphthalein TS.

Acceptance criteria: A pink color is produced.

- **B. IDENTIFICATION TESTS—GENERAL, Sulfate** (191)

Analysis: To 5 mL of the solution from *Identification test A* add 0.5 mL of iodine TS.

Acceptance criteria: The solution is colorless and meets the requirements of the barium chloride test.

- **C. IDENTIFICATION TESTS—GENERAL, Sodium** (191): Meets the requirements of the pyroantimonate precipitate test

ASSAY

PROCEDURE

Sample: 250 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N iodine VS

Back titrant: 0.1 N sodium thiosulfate VS

Blank: 50.0 mL of 0.1 N iodine VS, accurately measured

Endpoint detection: Colorimetric

Analysis: Add the *Sample* to a 500-mL beaker, add 50.0 mL of 0.1 N iodine VS, accurately measured, and shake to dissolve. Add 1 mL of starch TS, and titrate with 0.1 N sodium thiosulfate VS to a clear endpoint. Perform a blank determination, and make any necessary correction. Calculate the percentage of sodium sulfite (Na_2SO_3) in the *Sample* taken:

$$\text{Result} = [(B - V) \times N \times F \times 100] / W$$

B = 0.1 N sodium thiosulfate VS volume consumed by the *Blank*

V = 0.1 N sodium thiosulfate VS volume consumed by the *Sample*

N = actual normality of the *Back titrant* (mEq/mL)

F = equivalency factor, 63.0 mg/mEq

W = weight of *Sample* (mg)

Acceptance criteria: 95.0%–100.5%

IMPURITIES

- **HEAVY METALS**, *Method I* (231)

Sample solution: To 8.0 g of Sodium Sulfite add 25 mL of water. Shake until mostly dissolved, and slowly and carefully add 15 mL of hydrochloric acid. Heat to boiling. Cool, and dilute with water to 100.0 mL. Use a 25-mL portion.

Acceptance criteria: NMT 10 ppm

- **LIMIT OF IRON**

Standard solution: Immediately before use, dilute 1 volume of *Standard Iron Solution*, prepared as directed under *Iron* (241), to 10 mL with water. [NOTE—This solution contains the equivalent of 1 µg/mL of iron.]

Sample solution: 10.0 g of Sodium Sulfite in 25 mL of water. Shake until mostly dissolved, and add 15 mL of hydrochloric acid. Heat to boiling. Cool, and dilute with water to 100.0 mL. Use a 10-mL portion.

Analysis: To the *Standard solution* and the *Sample solution*, separately add 2 mL of a citric acid solution (200 g/L), and then add 0.1 mL of thioglycolic acid. Make alkaline with stronger ammonia water, and dilute with water to 20 mL. Allow to stand for 5 min.

Acceptance criteria: Any pink color in the *Sample solution* is not more intense than that in the *Standard solution* (NMT 10 ppm).

- **LIMIT OF SELENIUM**

[CAUTION—Selenium is toxic; handle with care.]

Selenium standard solution: 100 µg/mL of selenium is prepared as follows. Dissolve 0.1 g of metallic selenium in 2 mL of nitric acid. Evaporate to dryness, add 2 mL of water, and evaporate to dryness. Repeat the addition of water and the evaporation to dryness three more times. Dissolve the residue so obtained in 50 mL of

diluted hydrochloric acid. Transfer to a 1000-mL volumetric flask, and dilute with diluted hydrochloric acid to volume.

Standard solution: To 1.0 g of Sodium Sulfite add 0.2 mL of *Selenium standard solution* and 10 mL of formaldehyde TS, and slowly add 2 mL of hydrochloric acid. Heat in a water bath for 20 min.

Sample solution: To 3.0 g of Sodium Sulfite add 10 mL of formaldehyde TS, and slowly add 2 mL of hydrochloric acid.

Analysis: Heat the *Standard solution* and the *Sample solution* in a water bath for 20 min.

Acceptance criteria: Any pink color in the *Sample solution* is not more intense than that in the *Standard solution* (NMT 10 ppm).

• LIMIT OF THIOSULFATES

Sample solution: 20 mg/mL of Sodium Sulfite

Analysis: To 100 mL of the *Sample solution*, add 10 mL of formaldehyde TS and 10 mL of acetic acid. Allow to stand for 5 min. Add 0.5 mL of starch TS, and titrate with 0.1 N iodine VS. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*), and note the difference in volumes required.

Acceptance criteria: The difference in volumes is NMT 0.15 mL (NMT 0.1%).

• LIMIT OF ZINC

Zinc standard stock solution: A solution of 1 mL of acetic acid and the amount of zinc sulfate equivalent to 0.440 g of $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ in 100.0 mL of water. [NOTE—This solution contains the equivalent of 1000 µg/mL of Zn.]

Zinc standard solution: 25 µg/mL of zinc from *Zinc standard stock solution*

Standard solutions: Transfer 1.0-, 2.0-, and 4.0-mL portions of *Zinc standard solution* to separate 100-mL volumetric flasks. Dilute the contents of each flask with water to volume, and mix to obtain solutions having known concentrations of 0.25, 0.5, and 1.0 µg/mL of zinc.

Sample stock solution: 100 mg/mL of Sodium Sulfite is prepared as follows. To 10.0 g of Sodium Sulfite add 25 mL of water. Shake until mostly dissolved, and slowly add 15 mL of hydrochloric acid. Heat to boiling. Cool, and dilute with water to 100.0 mL.

Sample solution: 20.0 mg/mL of Sodium Sulfite from the *Sample stock solution*

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Zinc emission line at 213.9 nm

Lamp: Zinc hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Standard solutions* and the *Sample solution*
Plot the absorbances of the *Standard solutions* versus concentration of zinc, in µg/mL, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration of zinc, in µg/mL, in the *Sample solution*.

Acceptance criteria: NMT 25 ppm

SPECIFIC TESTS

• COLOR AND CLARITY OF SOLUTION

Analysis: Examine the solution prepared for *Identification test A*.

Acceptance criteria: The solution is clear and colorless.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at room temperature.

Sodium Tartrate

$\text{C}_4\text{H}_4\text{Na}_2\text{O}_6 \cdot 2\text{H}_2\text{O}$

230.08

Disodium L-tartrate;

Disodium (+)-2,3-dihydroxybutanedioic acid [868-18-8].

DEFINITION

Sodium Tartrate contains NLT 99.0% and NMT 100.5% of sodium tartrate ($\text{C}_4\text{H}_4\text{Na}_2\text{O}_6$), calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Sodium (191):** Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Tartrate (191):** Meets the requirements

ASSAY

• PROCEDURE

Sample: 250 mg, previously dried at 150° for 3 h

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N Perchloric acid VS (in glacial acetic acid)

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 150 mL of glacial acetic acid by stirring and heating to near the boiling point. Cool to room temperature. Titrate with 0.1 N perchloric acid VS (in glacial acetic acid) to a potentiometric endpoint. Perform a blank determination, and make any necessary adjustments. Each mL of 0.1 N perchloric acid is equivalent to 9.703 mg of sodium tartrate ($\text{C}_4\text{H}_4\text{Na}_2\text{O}_6$).

Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES

- **HEAVY METALS, Method I (231):** NMT 20 ppm

SPECIFIC TESTS

- **pH (791):** 7–9 (1 in 10 solution)
- **LOSS ON DRYING (731):** Dry a sample at 150° for 3 h: it loses 14.0%–17.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in a tight container. No storage requirements specified.

Sodium Thiosulfate—see Sodium Thiosulfate General Monographs

Sorbic Acid

$\text{C}_6\text{H}_8\text{O}_2$

112.13

2,4-Hexadienoic acid, (*E,E*)-; 2,4-Hexadienoic acid; (*E,E*)-Sorbic acid; Sorbic acid [110-44-1].

DEFINITION

Sorbic Acid contains NLT 99.0% and NMT 101.0% of $\text{C}_6\text{H}_8\text{O}_2$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B.** A 1-in-400,000 solution in isopropyl alcohol exhibits an absorbance maximum at 254 ± 2 nm.

ASSAY• **PROCEDURE**

Sample solution: Dissolve 250 mg of Sorbic Acid in a mixture of 50 mL of methanol and 25 mL of water that previously has been neutralized with 0.02 N sodium hydroxide. Add phenolphthalein TS.

Analysis: Titrate with 0.1 N sodium hydroxide VS to the first pink color that persists for at least 30 s. Each mL of 0.1 N sodium hydroxide is equivalent to 11.21 mg of $C_6H_8O_2$.

Acceptance criteria: 99.0%–101.0% on the anhydrous basis

IMPURITIES**Inorganic Impurities**

- **RESIDUE ON IGNITION** <281>: NMT 0.2%
- **HEAVY METALS**, *Method II* <231>: 10 ppm

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** <741>: 132° – 135°
- **WATER DETERMINATION**, *Method I* <921>: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light, and avoid exposure to excessive heat.
- **USP REFERENCE STANDARDS** <11>
USP Sorbic Acid RS

Sorbitan Monolaurate

Sorbitan, esters, monododecanoate;
Sorbitan monolaurate [1338-39-2].

DEFINITION

Sorbitan Monolaurate is a partial ester of lauric acid with Sorbitol and its mono- and dianhydrides. It yields, upon saponification, NLT 55.0% and NMT 63.0% of fatty acids, and NLT 39.0% and NMT 45.0% of polyols (w/w).

IDENTIFICATION

- **A.**
Sample: 1 g of the residue obtained in the Assay for *Fatty Acids*
Acceptance criteria
Fats and Fixed Oils, Acid Value <401>: 260–280
Fats and Fixed Oils, Iodine Value <401>: NMT 5
- **B.**
Standard solution: 33 mg/mL of USP Isosorbide RS, 25 mg/mL of USP 1,4-Sorbitan RS, and 25 mg/mL of sorbitol
Sample solution: 250 mg/mL of the polyols from the Assay for *Polyols*
Chromatographic system
(See *Chromatography* <621>, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel
Application volume: 2 μ L
Developing solvent system: Acetone and glacial acetic acid (50:1)

Spray reagent: Sulfuric acid and water (50:50)

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Standard solution* and *Sample solution*, and allow the spots to dry. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Spray evenly with *Spray reagent* until the surface is uniformly wet (do not overspray), and immediately place the sprayed plate on a 200° hot plate in a well-ventilated hood. Char until white fumes of sulfur trioxide cease, and cool.

Acceptance criteria: The R_f values of the spots of the *Sample solution* correspond to those of the spots of the *Standard solution*.

ASSAY• **FATTY ACIDS**

Sample: 10 g

Analysis: Transfer the *Sample* to a 500-mL conical flask. Cautiously add 100 mL of alcohol and 3.0 g of potassium hydroxide, and a few glass beads. Connect a suitable condenser to the flask, reflux the mixture on a hot plate for 2 h, add 100 mL of water, and heat on a steam bath to evaporate the alcohol, adding water occasionally to replace the alcohol. Continue the evaporation until the odor of alcohol can no longer be detected, and transfer the saponification mixture, with the aid of 100 mL of hot water, to a 500-mL separator. Using extreme caution, neutralize to litmus paper with a mixture of equal volumes of sulfuric acid and water, noting the volume used, and add a 10% excess of the dilute acid. Allow the solution to cool. If salts appear, add sufficient water to produce a clear solution. Cautiously add 100 mL of solvent hexane, shake thoroughly, and withdraw the lower layer into a second 500-mL separator. Similarly extract with two more 100-mL portions of solvent hexane. Extract the combined hexane layers with 50-mL portions of water until neutral to litmus paper. Combine the extracts with the original aqueous phase to use for the Assay for *Polyols*. Evaporate the solvent hexane in a tared beaker on a steam bath nearly to dryness, dry under vacuum at 60° for 1 h, cool in a desiccator, and weigh the fatty acids.

Acceptance criteria: 55.0%–63.0%

• **POLYOLS**

Sample solution: Aqueous solution retained from the Assay for *Fatty Acids*

Analysis: Neutralize the *Sample solution* with potassium hydroxide solution (1 in 10) to a pH of 7, using a pH meter. Evaporate on a steam bath to a moist residue, extract the polyols from the salts with three 150-mL portions of dehydrated alcohol, boiling the salt residue for 3 min, and crushing it, as necessary, with the flattened end of a stirring rod during each extraction; filtering each extract while hot through a medium-porosity sintered-glass funnel provided with a sheet of retentive filter paper on which a layer of purified siliceous earth has been superimposed; and receiving the filtrates in a 1-L suction flask. Transfer the clear alcoholic polyols solution to a tared beaker, evaporate the alcohol on a steam bath, dry under vacuum at 60° for 1 h, cool in a desiccator, and weigh the polyols.

Acceptance criteria: 39.0%–45.0% (w/w)

IMPURITIES

Sorbitan Sesquioleate

DEFINITION

Sorbitan Sesquioleate is a partial oleate ester of Sorbitol and its mono- and dianhydrides. It yields, upon saponification, NLT 74.0% and NMT 80.0% of fatty acids, and NLT 22.0% and NMT 28.0% of polyols (w/w).

IDENTIFICATION

• A.

Sample: 1 g of the residue obtained in the *Assay for Fatty Acids*

Acceptance criteria

Fats and Fixed Oils, *Acid Value* (401): 192–204

Fats and Fixed Oils, *Iodine Value* (401): 75–95

• B.

Standard solution: 33 mg/mL of USP Isosorbide RS, 25 mg/mL of USP 1,4-Sorbitan RS, and 25 mg/mL of sorbitol

Sample solution: 250 mg/mL of the polyols, obtained in the *Assay for Polyols*

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 2 µL

Developing solvent system: Acetone and glacial acetic acid (50:1)

Spray reagent: Sulfuric acid and water (50:50)

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Standard solution* and *Sample solution*, and allow the spots to dry. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Spray evenly with *Spray reagent* until the surface is uniformly wet (do not overspray), and immediately place the sprayed plate on a 200° hot plate in a well-ventilated hood. Char until white fumes of sulfur trioxide cease, and cool.

Acceptance criteria: The R_f values of the spots from the *Sample solution* correspond to those of the spots from the *Standard solution*.

ASSAY

• FATTY ACIDS

Sample: 10 g

Analysis: Transfer the *Sample* to a 500-mL conical flask. Cautiously add 100 mL of alcohol, 3.5 g of potassium hydroxide, and a few glass beads. Connect a suitable condenser to the flask, reflux the mixture on a hot plate for 2 h, add 100 mL of water, and heat on a steam bath to evaporate the alcohol, adding water occasionally to replace the alcohol. Continue the evaporation until the odor of alcohol can no longer be detected, and transfer the saponification mixture, with the aid of 100 mL of hot water, to a 500-mL separator. Using extreme caution, neutralize to litmus paper with a mixture of equal volumes of sulfuric acid and water, noting the volume used, and add a 10% excess of the dilute acid. Allow the solution to cool. If salts appear, add sufficient

water to produce a clear solution. Cautiously add 100 mL of solvent hexane, shake thoroughly, and withdraw the lower layer into a second 500-mL separator. Similarly extract with two more 100-mL portions of solvent hexane. Extract the combined hexane layers with 50-mL portions of water until neutral to litmus paper. Combine the extracts with the original aqueous phase to use for the *Assay for Polyols*. Evaporate the solvent hexane in a tared beaker on a steam bath nearly to dryness, dry under vacuum at 60° for 1 h, cool in a desiccator, and weigh the fatty acids.

Acceptance criteria: 74.0%–80.0%

• POLYOLS

Sample solution: Aqueous solution retained from the *Assay for Fatty Acids*

Analysis: Neutralize the *Sample solution* with a potassium hydroxide solution (1 in 10) to a pH of 7, using a pH meter. Evaporate on a steam bath to a moist residue, extract the polyols from the salts with three 150-mL portions of dehydrated alcohol, boiling the salt residue for 3 min, and crushing it, as necessary, with the flattened end of a stirring rod, during each extraction; filtering each extract while hot through a medium-porosity, sintered-glass funnel provided with a sheet of retentive filter paper on which a layer of purified siliceous earth has been superimposed; and receiving the filtrates in a 1-L suction flask. Transfer the clear alcoholic polyols solution to a tared beaker, evaporate the alcohol on a steam bath, dry under vacuum at 60° for 1 h, cool in a desiccator, and weigh the polyols.

Acceptance criteria: 22.0%–28.0% (w/w)

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 1.4%

Sorbitol

C₆H₁₄O₆
D-Glucitol [50-70-4].

182.17

DEFINITION

Sorbitol contains NLT 91.0% and NMT 100.5% of D-sorbitol, calculated on the anhydrous basis. The amounts of total sugars, other polyhydric alcohols, and any hexitol anhydrides, if detected, are not included in the requirements, nor in the calculated amount under *Other Impurities* in *General Notices*.

IDENTIFICATION

- **A.**

Sample solution: 1 g of Sorbitol in 75 mL of water

Analysis: Transfer 3 mL of *Sample solution* to a 15-cm test tube, and add 3 mL of freshly prepared catechol solution (1 in 10), and mix. Add 6 mL of sulfuric acid, then gently heat the tube in a flame for 30 s.

Acceptance criteria: A deep pink or wine-red color appears.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the *Assay*.

ASSAY**PROCEDURE**

Mobile phase: Use degassed water.

System suitability solution: Prepare a solution containing 4.8 mg/g of each USP Sorbitol RS and mannitol

Standard solution: 4.8 mg/g of USP Sorbitol RS

Sample solution: Dissolve 0.10 g of Sorbitol in water, and dilute with water to 20 g. Record the final solution weight, and mix thoroughly.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm × 10-cm; packing L34

Temperature

Column: 50 ± 2°

Detector: 35°

Flow rate: 0.7 mL/min

Injection size: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for mannitol and sorbitol are about 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between sorbitol and mannitol, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage, on the anhydrous basis, of D-sorbitol in the portion of Sorbitol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/(100 - W)) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Sorbitol RS in the *Standard solution* (mg/g)

C_U = concentration of Sorbitol in the *Sample solution* (mg/g)

W = percentage obtained in the test for *Water Determination*

Acceptance criteria: 91.0%–100.5% on the anhydrous basis

IMPURITIES**LIMIT OF NICKEL**

Sample solution: Dissolve 20.0 g of Sorbitol in diluted acetic acid, and dilute with diluted acetic acid to 150 mL.

Blank solution: 150 mL of diluted acetic acid

Standard solutions: Prepare three solutions by adding 0.5, 1.0, and 1.5 mL of nickel standard solution TS to 20.0 g of Sorbitol dissolved in diluted acetic acid, and dilute with the same solvent to 150 mL.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Standard solutions* and *Sample solution*

To each sample add 2.0 mL of a saturated ammonium pyrrolidinedithiocarbamate solution (containing 10 g/L of ammonium pyrrolidinedithiocarbamate) and 10.0 mL of methyl isobutyl ketone, and shake for 30 s. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer. Set the instrument to zero using the organic layer from the *Blank solution*. Concomitantly determine the absorbances of the organic layer from the *Samples* at least three times each. Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution*. Between each measurement, aspirate the organic layer from the *Blank solution*, and ascertain that the reading returns to zero. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution*.

Acceptance criteria: NMT 1 ppm

- **RESIDUE ON IGNITION** (281): NMT 0.1%, determined on a 1.5-g portion

REDUCING SUGARS

[NOTE—The amount determined in this test is not included in the calculated amount under *Other Impurities* in the *General Notices*.]

Sample solution: Dissolve 3.3 g of Sorbitol in 3 mL of water with the aid of gentle heat. Cool, and add 20.0 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 min, and maintain

boiling for 3 min. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water.

Analysis: When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added toward the end of the titration, as an indicator.

Acceptance criteria: NLT 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to NMT 0.3% of reducing sugars, as glucose.

- **CHLORIDE AND SULFATE, Chloride** (221) (if labeled for use in preparing parenteral dosage forms)

Sample: 1.5 g

Acceptance criteria: The *Sample* shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (NMT 0.0050%).

- **CHLORIDE AND SULFATE, Sulfate** (221) (if labeled for use in preparing parenteral dosage forms)

Sample: 1.0 g

Acceptance criteria: The *Sample* shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid (NMT 0.01%).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62):

The total aerobic count using the *Plate Method* is NMT 1000 cfu/g, and the total combined molds and yeasts count is NMT 100 cfu/g.

- **pH** (791): 3.5–7.0, in a 10% (w/w) solution in carbon dioxide-free water

- **WATER DETERMINATION, Method I** (921): NMT 1.5%

- **CLARITY AND COLOR OF SOLUTION** (if labeled for use in preparing parenteral dosage forms)

Sample: 10.0 g

Analysis: Dissolve the *Sample* in 100.0 mL of carbon dioxide-free water.

Acceptance criteria: The solution is clear and colorless.

- **BACTERIAL ENDOTOXINS TEST** (85) (if labeled for use in preparing parenteral dosage forms): NMT 4 USP Endotoxin Units/g for parenteral dosage forms having a concentration of less than 100 g/L of sorbitol, and NMT 2.5 USP Endotoxin Units/g for parenteral dosage forms having a concentration of 100 g/L or more of sorbitol

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements are specified.
- **LABELING:** Sorbitol intended for use in preparing parenteral dosage forms is so labeled.
- **USP REFERENCE STANDARDS** (11)
USP Endotoxin RS
USP Sorbitol RS

Noncrystallizing Sorbitol Solution

DEFINITION

Noncrystallizing Sorbitol Solution is an aqueous solution containing NLT 45.0% of D-sorbitol ($C_6H_{14}O_6$) (w/w). The amounts of total sugars, other polyhydric alcohols, and any hexitol anhydrides, if detected, are not included in the requirements nor in the calculated amount under *General Notices*, 5.60.10. *Other Impurities in USP and NF Articles*.

IDENTIFICATION

- **A. PROCEDURE**

Sample solution: Dissolve 1.4 g of Noncrystallizing Sorbitol Solution in 75 mL of water.

Analysis: Transfer 3 mL of *Sample solution* to a 15-cm test tube. Add 3 mL of freshly prepared catechol solution (1 in 10), and mix. Add 6 mL of sulfuric acid, mix again, and gently heat the tube in a flame for 30 s.

Acceptance criteria: A deep pink or wine-red color appears.

- **B.** The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

- **C. LIMIT OF DIETHYLENE GLYCOL AND ETHYLENE GLYCOL**

Diluent: Acetone and water (96:4)

Standard solution: 0.08 mg/mL of USP Diethylene Glycol RS and 0.08 mg/mL of USP Ethylene Glycol RS in *Diluent*.

Sample solution: Transfer 2.0 g of Noncrystallizing Sorbitol Solution to a 25-mL volumetric flask. Add 1.0 mL of *Diluent* to the flask, and mix on a vortex mixer for 3 min. Add the remaining *Diluent* to the flask to volume in three equal portions. Mix on a vortex mixer for about 3 min after each addition of *Diluent*. Pass a portion of the supernatant layer obtained through a 0.45- μ m nylon filter. Discard the first 2 mL of the filtrate, and collect the rest of the filtrate for analysis.

[NOTE—Acetone is used to precipitate sorbitol.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm \times 15-m fused-silica capillary column; 0.25- μ m layer of phase G46

Temperature

Detector: 300°

Injector port: 240°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	2
70	50	300	5

Carrier gas: Helium

Flow rate: 3.0 mL/min

Injection size: 1.0 μ L

Injection type: Split injection. The split ratio is about 10:1. [NOTE—A split liner, deactivated with glass wool, is used.]

System suitability

Sample: *Standard solution*

[NOTE—Diethylene glycol elutes after ethylene glycol in the chromatogram]

Suitability requirements

Resolution: NLT 30 between ethylene glycol and diethylene glycol

Analysis

Samples: *Standard solution* and *Sample solution*

Based on the *Standard solution*, identify the peaks of ethylene glycol and diethylene glycol. Compare the peak areas of ethylene glycol and diethylene glycol in the *Standard solution* and the *Sample solution*.

Acceptance criteria

Diethylene glycol: The peak area of diethylene glycol in the *Sample solution* is NMT the peak area of diethylene glycol in the *Standard solution*, corresponding to NMT 0.10% of diethylene glycol in Noncrystallizing Sorbitol Solution.

Ethylene glycol: The peak area of ethylene glycol in the *Sample solution* is NMT the peak area of ethylene glycol in the *Standard solution*, corresponding to NMT 0.10% of ethylene glycol in Noncrystallizing Sorbitol Solution.

ASSAY**• PROCEDURE**

Mobile phase: Use degassed water.

System suitability solution: 4.8 mg/g each of mannitol and USP Sorbitol RS

Standard solution: 4.8 mg/g of USP Sorbitol RS

Sample solution: Weigh 0.20 g of Noncrystallizing Sorbitol Solution, and dissolve in and dilute with water to 20 g. Record the final solution weight.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm × 10-cm; packing L34

Temperature

Detector: 35°

Column: 50 ± 2°

Flow rate: 0.7 mL/min

Injection size: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for mannitol and sorbitol are about 0.6 and 1.0, respectively, *System suitability solution*.]

Suitability requirements

Resolution: NLT 2.0 between sorbitol and mannitol, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of D-sorbitol (C₆H₁₄O₆) in the portion of Noncrystallizing Sorbitol Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Sorbitol RS in the *Standard solution* (mg/g)

C_U = concentration of Noncrystallizing Sorbitol Solution in the *Sample solution* (mg/g)

Acceptance criteria: NLT 45.0%

IMPURITIES**Inorganic Impurities**

• RESIDUE ON IGNITION <281>: NMT 0.1%, calculated on the anhydrous basis, determined on a 2-g portion

• LIMIT OF NICKEL

Solution A: A saturated ammonium pyrrolidine dithiocarbamate solution (containing 10 mg/mL of ammonium pyrrolidine dithiocarbamate)

Sample solution: Dissolve 20.0 g of Noncrystallizing Sorbitol Solution in diluted acetic acid, and dilute with diluted acetic acid to 100.0 mL. Add 2.0 mL of *Solution A* and 10.0 mL of methyl isobutyl ketone, and shake for 30 s. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Blank solution: Prepare as directed for the *Sample solution*, except omit the use of the Noncrystallizing Sorbitol Solution.

Standard solutions: Prepare as directed for the *Sample solution*, except prepare three solutions by adding 0.5, 1.0, and 1.5 mL of nickel standard solution TS.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 232.0 nm (maximum absorbance)

Lamp: Nickel hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank solution*

Set the instrument to zero using the *Blank solution*. Concomitantly determine the absorbances of the *Standard solutions* and the *Sample solution* at least three times each. Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution*. Between each measurement, aspirate the *Blank solution*, and ascertain that the reading returns to zero. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution*.

Acceptance criteria: NMT 1 µg/g on the anhydrous basis

Organic Impurities**• PROCEDURE: REDUCING SUGARS**

Sample: An amount of Noncrystallizing Sorbitol Solution, equivalent to 3.3 g on the anhydrous basis.

Analysis: To the *Sample*, add 3 mL of water, 20.0 mL of cupric citrate TS, and a few glass beads. Heat so that boiling begins after 4 min, and maintain boiling for 3 min. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS, added towards the end of the titration, as an indicator.

Acceptance criteria: NLT 12.8 mL of 0.05 N sodium thiosulfate VS is required corresponding to NMT 0.3% of reducing sugars, on the anhydrous basis, as glucose. The amount determined in this test is not included in the calculated amount under *General Notices*, 5.60.10. *Other Impurities in USP and NF Articles*.

SPECIFIC TESTS

- MICROBIAL ENUMERATION TESTS** <61> and **ABSENCE OF SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count using the *Plate Method* is NMT 1000 cfu/mL, and the total combined molds and yeasts count is NMT 100 cfu/mL.
- pH** <791>: 5.0–7.5, in a 14% (w/w) solution of Noncrystallizing Sorbitol Solution in carbon dioxide-free water

Sorbitol Sorbitan Solution

Former Title: Anhydriized Liquid Sorbitol

DEFINITION

Sorbitol Sorbitan Solution is a water solution containing, on the anhydrous basis, NLT 25.0% of D-sorbitol (C₆H₁₄O₆) and NLT 15.0% of 1,4-sorbitan (C₆H₁₂O₅). The amounts of total sugars, other polyhydric alcohols, and any other hexitol anhydrides, if detected, are not included in the requirements or in the calculated amount under *General Notices*, 5.60.10. *Other Impurities in USP and NF Articles*.

IDENTIFICATION**A. PROCEDURE**

Sample: 1.4 g of Sorbitol Sorbitan Solution in 75 mL of water

Analysis: Transfer 3 mL of *Sample* to a 15-cm test tube. Add 3 mL of freshly prepared catechol solution (1 in 10), and mix. Add 6 mL of sulfuric acid, mix again, then gently heat the tube in a flame for about 30 s.

Acceptance criteria: A deep pink or wine-red color appears.

- B.** The retention times of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

C. LIMIT OF DIETHYLENE GLYCOL AND ETHYLENE GLYCOL

Diluent: Acetone and water (96:4)

Standard solution: 0.08 mg/mL of USP Diethylene Glycol RS and 0.08 mg/mL of USP Ethylene Glycol RS in *Diluent*

Sample solution: Transfer 2.0 g of Sorbitol Sorbitan Solution to a 25-mL volumetric flask. Add 1.0 mL of *Diluent* to the flask, and mix on a vortex mixer for about 3 min. Add the remaining *Diluent* to the flask to volume in three equal portions. Mix on a vortex mixer for about 3 min after each addition of *Diluent*. Pass a portion of the supernatant layer obtained through a 0.45- μ m nylon filter. Discard the first 2 mL of the filtrate, and collect the rest of the filtrate for analysis. [NOTE—Acetone is used to precipitate sorbitol.]

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm \times 15-m fused-silica capillary column; 0.25- μ m layer of phase G46

Temperature

Detector: 300°

Injector port: 240°

Column: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	2
70	50	300	5

Carrier gas: Helium

Flow rate: 3.0 mL/min

Injection size: 1.0 μ L

Injection type: Split injection. The split ratio is about 10:1. [NOTE—A split liner, deactivated with glass wool, is used.]

System suitability

Sample: *Standard solution*

[NOTE—Diethylene glycol elutes after ethylene glycol in the chromatogram.]

Suitability requirements

Resolution: NLT 30 between ethylene glycol and diethylene glycol

Analysis

Samples: *Standard solution* and *Sample solution*
Based on the *Standard solution*, identify the peaks of ethylene glycol and diethylene glycol. Compare peak areas of ethylene glycol and diethylene glycol in the *Standard solution* and the *Sample solution*.

Acceptance criteria

Diethylene glycol: The peak area of diethylene glycol in the *Sample solution* is NMT the peak area of diethylene glycol in the *Standard solution*, corresponding to NMT 0.10% of diethylene glycol in Sorbitol Sorbitan Solution.

Ethylene glycol: The peak area of ethylene glycol in the *Sample solution* is NMT the peak area of ethylene

glycol in the *Standard solution*, corresponding to NMT 0.10% of ethylene glycol in Sorbitol Sorbitan Solution.

ASSAY**PROCEDURE**

Mobile phase: Water

System suitability solution: 10 mg/g of sorbitol, 4 mg/g of 1,4-sorbitan, 4 mg/g of isosorbide, and 1 mg/g of mannitol in water

Standard solution: 10 mg/g of USP Sorbitol RS and 4 mg/g of USP 1,4-Sorbitan RS in water

Sample solution: Dissolve 0.40 g of Sorbitol Sorbitan Solution in water, and dilute with water to about 20 g. Record the weight of the final solution, and mix thoroughly.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm \times 10-cm; packing L34

Temperature

Detector: 35°

Column: 50 \pm 2°

Flow rate: 0.6 mL/min

Injection size: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for 1,4-sorbitan, isosorbide, mannitol, and sorbitol are about 0.35, 0.43, 0.7, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between 1,4-sorbitan and isosorbide, *System suitability solution*

Relative standard deviation: NMT 2.0% for each analyte, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Separately calculate the percentages, on the anhydrous basis, of 1,4-sorbitan and D-sorbitol in the portion of Sorbitol Sorbitan Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times [100/(100 - W)] \times 100$$

r_U = peak responses of the corresponding analyte from the *Sample solution*

r_S = peak responses of the corresponding analyte from the *Standard solution*

C_S = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/g)

C_U = concentration of Sorbitol Sorbitan Solution in the *Sample solution* (mg/g)

W = percentage from the test for *Water Determination*

Acceptance criteria: NLT 25.0% of $C_6H_{14}O_6$ and NLT 15.0% of $C_6H_{12}O_5$ on the anhydrous basis

IMPURITIES**Inorganic Impurities**

- RESIDUE ON IGNITION** <281>: NMT 0.20%, calculated on the anhydrous basis on a 2-g portion

LIMIT OF NICKEL

Solution A: A saturated ammonium pyrrolidine dithiocarbamate solution (10 mg/mL of ammonium pyrrolidine dithiocarbamate)

Sample solution: 200 mg/mL of Sorbitol Sorbitan Solution in diluted acetic acid. To 100 mL of this solution add 2.0 mL of *Solution A* and 10.0 mL of methyl isobutyl ketone, and shake for 30 s. Protect from bright light. Allow the two layers to separate, and use the methyl isobutyl ketone layer.

Standard solutions: Prepare as directed for the *Sample solution*, except to prepare three solutions by adding 0.5, 1.0, and 1.5 mL of nickel standard solution TS.

Blank solution: Prepare as directed for the *Sample solution*, except to omit the use of Sorbitol Sorbitan Solution. Quantities should be increased five fold to ensure that a sufficient volume of *Blank solution* is available.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 232.0 nm (maximum absorbance)

Lamp: Nickel hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Blank solution*, *Standard solutions*, and *Sample solution*

Set the instrument to zero, using the *Blank solution*. Concomitantly determine the absorbances of the *Standard solutions* and the *Sample solution* at least three times each. Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution*. Between each measurement, aspirate the *Blank solution*, and ascertain that the reading returns to zero. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution*.

Acceptance criteria: NMT 1 ppm, calculated on the anhydrous basis

Organic Impurities

• **PROCEDURE: REDUCING SUGARS**

Sample: An amount of Sorbitol Sorbitan Solution equivalent to 3.3 g, on the anhydrous basis.

Analysis: To the *Sample*, add 3 mL of water, 20.0 mL of cupric citrate TS, and a few glass beads. Heat so that boiling begins after 4 min, and maintain boiling for 3 min. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS, using 2 mL of starch TS, added toward the end of the titration, as an indicator.

Acceptance criteria: NLT 12.8 mL of 0.05 N sodium thiosulfate VS is required, corresponding to NMT 0.3% of reducing sugars, on the anhydrous basis, as glucose.

[NOTE—The amount determined in this test is not included in the calculated amount under *General Notices*, 5.60.10. *Other Impurities in USP and NF Articles*.]

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED ORGANISMS** (62): The total aerobic microbial count using the *Plate Method* is NMT 1000 cfu/mL. The total combined molds and yeasts count is NMT 100 cfu/mL.
- **pH** (791): 4.0–7.0, in a 14% solution of Sorbitol Sorbitan Solution in carbon dioxide-free water
- **WATER DETERMINATION, Method I** (921): NMT 31.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.
- **LABELING:** The labeling indicates the percentage content, on the anhydrous basis, of D-sorbitol and 1,4-sorbitan.
- **USP REFERENCE STANDARDS** (11)
 - USP Diethylene Glycol RS
 - USP Ethylene Glycol RS
 - USP 1,4-Sorbitan RS
 - C₆H₁₂O₅ 164.16

USP Sorbitol RS

Sorbitol Solution—see *Sorbitol Solution General Monographs*

Soybean Oil—see *Soybean Oil General Monographs*

Hydrogenated Soybean Oil

[8016-70-4].

DEFINITION

Hydrogenated Soybean Oil is the product obtained by refining, bleaching, hydrogenation, and deodorization of oil obtained from seeds of the soya plant *Glycine max* Merr. (Fabaceae). The product consists mainly of triglycerides of palmitic and stearic acids.

IDENTIFICATION

- **A.** It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* (401).
- **B.** It meets the requirements in *Specific Tests for Melting Range or Temperature, Class II* (741).

IMPURITIES

• **LIMIT OF NICKEL**

Nickel standard solution: Immediately before use, prepare the equivalent of 0.2 µg/g of nickel by diluting 10 mL of nickel standard solution TS with water to 500 mL.

Sample solution: Weigh 5.0 g of Hydrogenated Soybean Oil into a previously tared platinum or silica crucible. Cautiously heat, and introduce into the substance a wick formed from twisted ashless filter paper. Ignite the wick. When the substance ignites, stop heating. After combustion, ignite in a muffle furnace at 600°. Continue the incineration until white ash is obtained. After cooling, transfer the residue, with the aid of two 2-mL portions of diluted hydrochloric acid, to a 25-mL volumetric flask, add 0.3 mL of nitric acid, and dilute with water to volume.

Standard solutions: Into three identical 10-mL volumetric flasks introduce 1.0, 2.0, and 4.0 mL of *Nickel standard solution*. To each flask add a 2.0-mL portion of the *Sample solution*, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption, equipped with a graphite furnace

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Analysis

Samples: *Sample solution* and *Standard solutions*
Determine the absorbances of the *Samples* at least three times each. Record the average of the steady readings for each of the *Samples*. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the added quantity of nickel, and draw the straight line best fitting the three plotted points. Extrapolate the line until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution*.

Acceptance criteria: NMT 1 µg/g

• **ALKALINE IMPURITIES**

Sample: 2.0 g

Analysis: Dissolve the *Sample* by gently heating in a mixture of 1.5 mL of alcohol and 3.0 mL of toluene. Add 0.05 mL of bromophenol blue TS, and titrate with 0.01 N hydrochloric acid VS to a yellow endpoint.

Acceptance criteria: NMT 0.4 mL of 0.01 N hydrochloric acid VS is required.

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE**, *Class II* (741): 66°–72°

• **FATS AND FIXED OILS**, *Acid Value* (401)

Sample: 10 g of Hydrogenated Soybean Oil

Analysis: Dissolve the *Sample* in 50 mL of a hot mixture of neutralized alcohol and toluene (1:1). Add 0.5 mL of phenolphthalein TS, and immediately titrate, while still hot, with 0.1 N potassium hydroxide VS to produce a permanent, faint pink color.

Acceptance criteria: NMT 0.5

• **FATS AND FIXED OILS**, *Fatty Acid Composition* (401): Hydrogenated Soybean Oil exhibits the composition profile of fatty acids in *Table 1*.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
<14	0	≤0.1
14	0	≤0.5
16	0	9–16
18	0	79–89
20	0	≤1.0
22	0	≤1.0
18	1	≤4.0
18	2	≤1.0
18	3	≤0.2

• **FATS AND FIXED OILS**, *Peroxide Value* (401): NMT 5.0

• **FATS AND FIXED OILS**, *Unsaponifiable Matter* (401)

Sample: 5.0 g

Acceptance criteria: NMT 1.0%

• **WATER DETERMINATION**, *Method I* (921): NMT 0.3%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE**: Preserve in tight, light-resistant containers. No storage requirements are specified.

Squalane

C₃₀H₆₂

422.81

Tetracosane, 2,6,10,15,19,23-hexamethyl-;
2,6,10,15,19,23-Hexamethyltetracosane [111-01-3].

DEFINITION

Squalane is a saturated hydrocarbon obtained by hydrogenation of squalene, an aliphatic triterpene occurring in some fish oils.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197F)

Sample: Undried specimen

Acceptance criteria: Meets the requirements

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.5%

• **CHROMATOGRAPHIC PURITY**

Standard solution: 20 mg/mL of USP Squalane RS in *n*-hexane

Sample solution: 20 mg/mL of Squalane in *n*-hexane

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 3-mm × 1.8-m; packed with 3% phase G1 on packing S1A

Temperatures

Detector: 280°

Injection port: 280°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
130	6	270	End

Carrier gas: Nitrogen

Flow rate: 25 mL/min

Injection volume: 2 µL

Analysis

Samples: *Standard solution* and *Sample solution*
Identify the squalane peak in the *Sample solution* by comparison of the retention time with that of the main peak in the *Standard solution*.

Acceptance criteria: The area of the squalane peak in the *Sample solution* is NLT 97% of the sum of the areas of all of the peaks.

SPECIFIC TESTS

• **SPECIFIC GRAVITY** (841): 0.807–0.810 at 20°

• **FATS AND FIXED OILS**, *Acid Value* (401): NMT 0.2

• **FATS AND FIXED OILS**, *Iodine Value* (401): NMT 4

• **FATS AND FIXED OILS**, *Saponification Value* (401): NMT 2

Stannous Chloride

SnCl₂ · 2H₂O

225.65

Tin chloride (SnCl₂) dihydrate [10025-69-1].

DEFINITION

Stannous Chloride contains NLT 98.0% and NMT 102.0% of SnCl₂ · 2H₂O.

IDENTIFICATION

• **A.**

Sample solution: To 0.40 g of Stannous Chloride add 1 mL of dilute hydrochloric acid solution (236 mL/L of hydrochloric acid), and dilute with water to 20 mL.
[NOTE—Keep a portion for the *Limit of Sulfate* test.]

Analysis: To 1 mL of the *Sample solution* add a mixture of 5 mL of water and 0.05 mL of mercuric chloride TS.

- Acceptance criteria:** A blackish-gray precipitate forms.
- **B.**
Sample: 1.0 g
Analysis 1: Dissolve the *Sample* in 3.0 mL of water. Add 0.5 mL of dilute sodium hydroxide solution (85 mg/mL of sodium hydroxide) to the cloudy solution.
Acceptance criteria 1: A yellowish, flocculent precipitate is formed.
Analysis 2: Add 6.5 mL of water to the solution resulting from *Analysis 1*. To 1.0 mL of the previously shaken suspension add 1.0 mL of sodium hydroxide solution (420 mg/mL of sodium hydroxide).
Acceptance criteria 2: The precipitate dissolves, and the resulting solution is clear and colorless.
 - **C. IDENTIFICATION TESTS—GENERAL, Chloride (191)**
Sample solution: Dissolve 10 mg of Stannous Chloride in 2 mL of 20% nitric acid.
Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: 0.1 g of Stannous Chloride

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N iodine VS

Blank: 50 mL of water

Endpoint detection: Colorimetric

Analysis: Dissolve the *Sample* in 50 mL of water freed from oxygen by purging with carbon dioxide or nitrogen for 15 min prior to the addition. Add 1.5 mL of 0.8 N hydrochloric acid, 5 g of potassium sodium tartrate, 10 g of sodium bicarbonate, and 1 mL of starch TS. Titrate the resulting solution immediately with *Titrant*. Perform a blank determination.

Calculate the percentage of stannous chloride ($\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$) in the *Sample*:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* consumed by the *Sample* (mL)

V_B = *Titrant* consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 112.8 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

• LIMIT OF SULFATE

Acetic acid solution: Dilute 30 mL of glacial acetic acid with water to 100 mL.

30% alcohol: Dilute 30 mL of alcohol with water to 100 mL.

Potassium sulfate solution 1: 1.8 mg/mL of potassium sulfate in 30% *Alcohol*. Immediately before use, dilute with 30% *Alcohol* to obtain a solution having a known concentration of about 18 µg/mL.

Potassium sulfate solution 2: 1.8 mg/mL of potassium sulfate in water. Immediately before use, dilute with water to obtain a solution having a known concentration of about 18 µg/mL.

Standard solution: Mix 3 mL of barium chloride solution (250 mg/mL) and 4.5 mL of *Potassium sulfate solution 1*. Shake, and let stand for 1 min. To 2.5 mL of this solution add 15 mL of *Potassium sulfate solution 2* and 0.5 mL of *Acetic acid solution*. Allow to stand for 5 min.

Sample solution: Use 15 mL of the solution prepared in *Identification test A*.

Analysis: Mix 3 mL of barium chloride solution (250 mg/mL) and 4.5 mL of *Potassium sulfate solution 1*. Shake, and let stand for 1 min. To 2.5 mL of this solution add the *Sample solution* and 0.5 mL of *Acetic acid solution*. Allow to stand for 5 min.

Acceptance criteria: Any opalescence in the *Sample solution* is not more intense than that in the *Standard solution* (500 ppm).

• LIMIT OF IRON

Standard iron solution: Prepare as directed under *Iron* (241), *Special Reagents*.

Standard solution: Immediately before use, dilute 1 mL of *Standard iron solution* with water to 10 mL. This solution contains the equivalent of 1 µg/mL of iron.

Sample solution: Dilute 5 mL of the *Sample solution* prepared as directed in *Substances Not Precipitated by Thioacetamide* with water to 10 mL.

Analysis: To 10 mL each of the *Standard solution* and the *Sample solution* add 2 mL of dilute citric acid (200 mg/mL) and 0.1 mL of thioglycolic acid, and mix. Make alkaline with a dilute ammonia solution (620 mL/L of ammonium hydroxide). Dilute with water to 20 mL. Allow the treated *Standard solution* and the treated *Sample solution* to stand for 5 min.

Acceptance criteria: Any pink color in the *Sample solution* is not more intense than that in the *Standard solution* (100 ppm).

• LIMIT OF LEAD

Dilute thioacetamide solution: [NOTE—Prepare immediately before use.] To 0.2 mL of thioacetamide TS add 1 mL of a mixture of 5 mL of water, 15 mL of 1 N sodium hydroxide, and 20 mL of 85% glycerin. Heat in a water bath for 20 s.

Standard lead solution: Prepare as directed under *Heavy Metals* (231), *Special Reagents*.

Standard solution: On the day of use, mix 1.0 mL of *Standard lead solution*, 6 mL of water, 3 mL of sodium hydroxide solution (420 mg/mL of sodium hydroxide), and 0.5 mL of *Dilute thioacetamide solution*.

Sample solution: Dissolve 1.0 g of Stannous Chloride in 2 mL of a mixture of nitric acid and hydrochloric acid (1:3). Heat the solution on a water bath until nitrous vapor is no longer evolved. Dissolve the residue in water, and dilute with water to 25 mL. To 5 mL of this solution add 3 mL of sodium hydroxide solution (420 mg/mL of sodium hydroxide) and 2 mL of water. Heat until a clear solution is obtained, and cool. Add 0.5 mL of *Dilute thioacetamide solution*, and allow to stand for 2 min.

Analysis: Compare the *Standard solution* and the *Sample solution*.

Acceptance criteria: Any color in the *Sample solution* is not more intense than that in the *Standard solution* (50 ppm).

SPECIFIC TESTS

• APPEARANCE OF SOLUTION

Standard stock solution: Pipet 30.0 mL of ferric chloride CS, 30.0 mL of cobaltous chloride CS, and 24.0 mL of cupric sulfate CS into a 100-mL volumetric flask. Dilute with 1% (w/v) hydrochloric acid to volume.

Standard solution: Dilute 1.0 mL of the *Standard stock solution* with 1% (w/v) hydrochloric acid to 100 mL.

Sample solution: Dissolve 10.0 g of Stannous Chloride in dilute hydrochloric acid solution, and dilute with dilute hydrochloric acid solution to 20 mL.

Acceptance criteria: The *Sample solution* is clear and colorless, or if not, not more intensely colored than the *Standard solution*.

• SUBSTANCES NOT PRECIPITATED BY THIOACETAMIDE

Sample solution: Dissolve 1.0 g of Stannous Chloride in dilute hydrochloric acid solution, and dilute with the same acid to 30 mL. Heat to boiling. Add 30 mL of thioacetamide TS, and boil for 15 min to produce *Solution A*. Filter 5 mL of *Solution A*, and heat the filtrate to boiling. Add 5 mL of thioacetamide TS, and boil for 15 min. If a precipitate is formed, add the remainder of *Solution A* to the mixture to produce *Solution A1*. Add 10 mL of thioacetamide TS, and boil. Repeat the series of operations from "Filter 5 mL" until a precipitate is no

longer formed on addition of thioacetamide TS to the filtrate obtained from the 5 mL of *Solution A* (*Solution A1*, *Solution A2*, and so on, respectively). If no precipitate is formed, or if no more precipitate is formed, combine the solution obtained with the remainder of *Solution A* (*Solution A1*, *Solution A2*, and so on, respectively), filter, and wash the precipitate with 10 mL of water. Heat the filtrate until the resulting vapor no longer turns a moistened piece of lead acetate test paper blackish-gray. Allow to cool, and dilute with water to 50 mL. [NOTE—Keep a portion for the *Limit of Iron* test.]

Analysis: Evaporate 25 mL of the *Sample solution* to dryness, and ignite at 600°.

Acceptance criteria: The residue weighs NMT 1 mg (0.2%).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

Corn Starch

Legend: + will adopt and implement; – will not stipulate

Nonharmonized attributes: Characters, Microbial Enumeration Tests and Tests for Specified Microorganisms, Labeling, and Packaging and Storage (USP)

Specific local attributes: Foreign matter (EP)

Reagents and reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

DEFINITION

Corn Starch consists of the starch granules separated from the mature grain of corn [*Zea mays* Linné (Fam. Gramineae)].

IDENTIFICATION

- **A. PROCEDURE:** Examine under a microscope, using NLT 20× magnification and using a mixture of glycerin and water (1:1) as a mounting agent.
Acceptance criteria: It appears either as angular polyhedral granules of irregular sizes with diameters ranging from 2–23 µm, or as rounded or spheroidal granules of irregular sizes with diameters ranging from 25–35 µm. The central hilum consists of a distinct cavity or two- to five-rayed cleft, and there are no concentric striations. Between orthogonally oriented polarizing plates or prisms, the starch granules show a distinct black cross intersecting at the hilum.
- **B. PROCEDURE**
Sample solution: 20 mg/mL in water
Analysis: Boil for 1 min, and cool.
Acceptance criteria: A thin, cloudy mucilage is formed.
- **C. PROCEDURE**
Sample solution: 1 mL of the mucilage obtained in Identification test B

Analysis: Add 0.05 mL of iodine and potassium iodide TS 2 to the *Sample solution*.

Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION (281):** NMT 0.6%, determined on a 1.0-g sample

LIMIT OF IRON

Standard iron stock solution A: Equivalent to 10 µg/mL of iron prepared as directed under *Iron* (241)

Standard iron stock solution B: 1 µg/mL of iron from *Standard iron stock solution A* in water

[NOTE—Prepare immediately before use.]

Standard iron solution: Transfer 10 mL of *Standard iron stock solution B* to a test tube, and add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

Sample solution: Shake 1.5 g of Corn Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, add 2 mL of citric acid solution (2 in 10), and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard iron solution*, corresponding to a limit of 10 ppm of iron.

LIMIT OF SULFUR DIOXIDE

Carbon dioxide: Use carbon dioxide, with a flow regulator that will maintain a flow of 100 ± 10 mL/min.

Bromophenol blue indicator solution: 0.2 mg/mL of bromophenol blue in dilute alcohol. Filter if necessary.

Hydrogen peroxide solution: Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Just before use, add 3 drops of *Bromophenol blue indicator solution*, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

Apparatus: Figure 1.

Figure 1

In this test, the sulfur dioxide is released from the sample in a boiling acid medium and is removed by a

stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500-mL three-neck, round-bottom boiling flask, A; separatory funnel, B, having a capacity of 100 mL or greater; a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask; a reflux condenser, C, having a jacket length of 200 mm, and a delivery tube, E, connecting the upper end of the reflux condenser to the bottom of a receiving test tube, D. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

Sample: 25.0 g of Corn Starch

Analysis: Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of 100 ± 5 mL/min through the *Apparatus*. Start the condenser coolant flow. Add 10 mL of *Hydrogen peroxide solution* to a receiving test tube. After 15 min, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer the *Sample* into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 h. Remove the receiving test tube, and transfer its contents to a 200-mL wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 min, and allow to cool.

Add 0.1 mL of *Bromophenol blue indicator solution*, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)).

Calculate the content, in ppm, of sulfur dioxide in the *Sample* taken:

$$\text{Result} = 1000 (32.03) \text{ VN/W}$$

32.03 = milliequivalent weight of sulfur dioxide

V = volume of titrant consumed (mL)

N = normality of the titrant

W = weight of the *Sample* (g)

Acceptance criteria: NMT 50 ppm

• **LIMIT OF OXIDIZING SUBSTANCES**

Sample solution: Transfer 4.0 g to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS.

Analysis: Titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch–iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate is required (20 ppm, calculated as H_2O_2).

SPECIFIC TESTS

- **♦MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 1000 cfu/g; the total combined molds and yeasts count does not exceed 100 cfu/g; and it meets the requirements of the test for the absence of *Escherichia coli*. Where it is intended for use in preparing Absorbable Dusting Powder, it also meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.♦
- **LOSS ON DRYING (731):** Dry 1 g at 130° for 90 min: it loses NMT 15.0% of its weight.
- **pH (791):** 4.0–7.0

Sample solution: Prepare a slurry by weighing 5.0 g of Corn Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water.

Analysis: Agitate continuously at a moderate rate for 1 min. Stop the agitation, and allow to stand for 15 min. Determine the pH to the nearest 0.1 unit.

ADDITIONAL REQUIREMENTS

- **♦PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.♦
- **♦LABELING:** Where Corn Starch is intended for use in preparing Absorbable Dusting Powder, it is so labeled, and the label states that it must be subjected to further processing during the preparation of Absorbable Dusting Powder.♦

Hydroxypropyl Corn Starch

For the Amylose derivative, *m* is about 300–1000.

DEFINITION

Hydroxypropyl Corn Starch is partially substituted 2-hydroxypropylether obtained from corn starch by a chemical modification of etherification with propylene oxide. In addition, this starch may be partially hydrolyzed using acids or enzymes to obtain thinned starch. It contains NLT 2.0% and NMT 7.0% of hydroxypropyl groups on the dried basis.

IDENTIFICATION

• **A. PROCEDURE**

Analysis: Examine under a microscope, using NLT 20× magnification and a mixture of glycerin and water (1:1) as a mounting agent.

Acceptance criteria: It presents either as angular polyhedral granules of irregular sizes with diameters of 2–23 µm, or as rounded or spheroidal granules of irregular sizes with diameters of 25–35 µm. The central hilum consists of a distinct cavity or 2- to 5-rayed cleft, and there are no concentric striations. Between crossed nicol prisms, the Hydroxypropyl Corn Starch granules show a distinct black cross intersecting at the hilum.

• **B. PROCEDURE**

Sample solution: Suspend 1 g of Hydroxypropyl Corn Starch in 50 mL of water, boil for 1 min, and cool.

Acceptance criteria: A translucent or clear mucilage is formed.

• C. PROCEDURE

Analysis: To 1 mL of the *Sample solution* obtained in *Identification test B* add 0.05 mL of iodine and potassium iodide TS 2.

Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

• D. PROCEDURE

Ninhydrin solution: Dissolve 3 g of ninhydrin in 100 mL of a 45.5-g/L solution of sodium metabisulfite.

Diluted sulfuric acid: 98 g/L of H₂SO₄

Sample: 100 mg of Hydroxypropyl Corn Starch

Analysis: Transfer the *Sample* to a 100-mL volumetric flask, and add 12.5 mL of *Diluted sulfuric acid*. Place the flask in a water bath, and heat until the *Sample* is dissolved. Cool, and dilute with water to 100 mL. [**CAUTION**—When sulfuric acid is miscible with water, it produces intense heat.]

Pipet 1 mL of this solution to a glass-stoppered, 25-mL graduated test tube and, with the tube immersed in cold water, add drop-wise 8 mL of sulfuric acid. Mix well, and place the tube in a boiling water bath for exactly 3 min. Immediately transfer the tube to an ice bath until the solution is chilled. Add 0.6 mL of *Ninhydrin solution*, carefully allowing the reagent to run down the walls of the test tube. Immediately shake the tube well, and place it in a water bath at 25° for 100 min. Dilute with sulfuric acid to 25 mL [**CAUTION**—Use sulfuric acid cautiously.], and mix by inverting the tube several times. Do not shake.

Acceptance criteria: A violet color develops within 5 min due to the presence of hydroxypropyl groups (starch ether).

ASSAY

• PROCEDURE FOR HYDROXYPROPYL GROUPS

Deuterium chloride solution: Dilute 1 mL of deuterium chloride (38% w/w) with 5 mL of deuterium oxide.

Internal standard solution: Disperse 50.0 mg of sodium 3-trimethylsilyl-1-propane sulfonate in about 5 g of deuterium oxide, weighed to the nearest 0.1 mg. Store in a sealed bottle.

Sample solution: Disperse 20 g of Hydroxypropyl Corn Starch in 200.0 mL of carbon dioxide-free water at room temperature. Agitate for 15 min, and filter. Repeat the operation two more times. If poor dispersibility or slow filtration is observed, use refrigerated carbon dioxide-free water for the washing operation. Dry the washed starch for NLT 4 h in vacuum at 30 ± 5°. Determine the moisture content (B) on 5 g of the washed and dried starch following the *Loss on Drying* test. Weigh 12.0 mg of the washed and dried starch in a 5-mm NMR tube. Add 0.75 mL of deuterium oxide and 0.1 mL of *Deuterium chloride solution*. Cap the tube, mix, and place it in a boiling water bath until a clear solution is obtained. [NOTE—This may take 3 min to 1 h.] When a clear solution is obtained, allow to cool to room temperature. Dry the exterior of the tube, and weigh to the nearest 0.1 mg. Add 0.05 mL of *Internal standard solution*, and weigh to the nearest 0.1 mg. Determine the mass of the *Internal standard solution* added. Mix thoroughly.

Nuclear magnetic resonance spectrometry

(See *Nuclear Magnetic Resonance* (761), *Quantitative Application*.)

Apparatus: FT-NMR spectrometer at minimum 300 MHz

Acquisition of ¹H NMR spectra: The following parameters may be used.

Sweep width: 8 ppm (about -1.0 to +7 ppm)

Irradiation frequency offset: None

Time domain: NLT 64 K

Pulse width: 90 degree

Pulse delay: 10 s

Dummy scans: 0

Number of scans: 8

Use the CH₃ signal of the internal standard for shift referencing. Set the shift of the peak of the singlet to 0 ppm. Record the FID signal.

Analysis

Samples: *Internal standard solution* and *Sample solution*
Call the integration sub-routine after phase corrections and baseline correction between -0.5 and +6 ppm. Measure the peak areas of the doublet from the methyl groups of the hydroxypropyl function at +1.2 ppm (A₂), and of the methyl groups at 0 ppm of the internal standard (A₁) without ¹³C-satellites.

Measure the signal coming from the 3 protons of the methyl group in the hydroxypropyl function.

Calculate the content of hydroxypropyl groups as a percentage (w/w, dried basis):

$$\text{Result} = (N \times A_2/A_1) \times (C_i \times W_i/W) \times (M_{r2}/M_{r1}) \times [100/(100 - B)] \times 100$$

N = numerical value representing the 3 methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate), 3

A₂ = area of the methyl groups of hydroxypropyl in Hydroxypropyl Corn Starch

A₁ = area of the methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate)

C_i = concentration of the internal standard in the *Internal standard solution* (mg/g)

W_i = weight of the *Internal standard solution* in the NMR tube (g)

W = weight of the washed and dried Hydroxypropyl Corn Starch in the NMR tube (mg)

M_{r1} = molecular weight of the internal standard, 218.32 g/mol

M_{r2} = molar mass of hydroxypropyl group, 59.09 g/mol

B = moisture content of the washed and dried Hydroxypropyl Corn Starch used in the *Sample solution*, as a percentage (w/w)

Acceptance criteria: The content of hydroxypropyl groups is 2.0%–7.0% on the dried basis.

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION** (281): NMT 0.6%, determined on a 1.0-g test specimen

• LIMIT OF IRON

Standard iron stock solution: Prepare a solution containing the equivalent of 10 µg/mL of iron, as directed under *Iron* (241).

Diluted standard iron solution: Immediately before use, dilute an accurately measured volume of *Standard iron stock solution* quantitatively with water to obtain a solution containing the equivalent of 1 µg/mL of iron.

Standard solution: Transfer 10 mL of the *Diluted standard iron solution* to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Sample solution: Shake 1.0 g of Hydroxypropyl Corn Starch with 20 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the

Standard solution, corresponding to a limit of 20 µg/g of iron.

- **LIMIT OF SULFUR DIOXIDE, Method IV (525):** NMT 50 ppm Organic Impurities

- **PROCEDURE 1: LIMIT OF OXIDIZING SUBSTANCES**

Sample: 4.0 g of Hydroxypropyl Corn Starch

Analysis: Transfer the *Sample* to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate VS is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate VS is required (20 µg/g, calculated as H₂O₂).

- **PROCEDURE 2: FOREIGN MATTER**

Sample: 50 mg/mL of Hydroxypropyl Corn Starch in a mixture of glycerin and water (1:1)

Analysis: Examine under a microscope, using NLT 20× magnification and a mixture of glycerin and water (1:1) as a mounting agent.

Acceptance criteria: NMT traces of matter other than Hydroxypropyl Corn Starch granules are present.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10³ cfu/g, and the total combined molds and yeasts count does not exceed 10² cfu/g. It meets the requirements of the test for the absence of *Escherichia coli*.
- **PH (791)**
Sample solution: Suspend 5.0 g of Hydroxypropyl Corn Starch in 25.0 mL of carbon dioxide-free water, and shake for 60 s. Allow to stand for 15 min.
Acceptance criteria: 4.5–8.0
- **LOSS ON DRYING (731):** Dry about 1 g at 130° for 90 min: it loses NMT 15.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

Pregelatinized Hydroxypropyl Corn Starch

DEFINITION

Pregelatinized Hydroxypropyl Corn Starch is prepared from Hydroxypropyl Corn Starch by mechanical processing in the presence of water, with or without heat, to rupture all or some of the starch granules, and is subsequently dried. It contains NLT 2.0% and NMT 7.0% of hydroxypropyl groups on the dried basis.

IDENTIFICATION

- **A. TEST FOR PREGELATINIZED STATE**

Sample: 1 g

Analysis: Disperse the *Sample* in 50 mL of water at a temperature NMT 25°. Shake vigorously until lumps completely disperse/solubilize or until lumps disappear. Allow to stand for 20 min.

Acceptance criteria: A translucent or clear mucilage without precipitate is formed.

- **B. TEST FOR STARCH**

Analysis: Disperse 0.5 g in 2 mL of water without heating, and add 0.05 mL of iodine and potassium iodide TS₂.

Acceptance criteria: A reddish-violet or blue color is produced.

- **C. NINHYDRIN TEST**

Ninhydrin solution: Dissolve 3 g of ninhydrin in

100 mL of a 45.5-g/L solution of sodium metabisulfite.

Diluted sulfuric acid: 98 g/L of H₂SO₄

Sample: 100 mg

Analysis: Transfer the *Sample* to a 100-mL volumetric flask, and add 12.5 mL of *Diluted sulfuric acid*. Place the flask in a water bath, and heat until the *Sample* is dissolved. Cool, and dilute with water to 100 mL. [**CAUTION**—When sulfuric acid is miscible with water, it produces intense heat.]

Pipet 1 mL of this solution to a glass-stoppered 25-mL graduated test tube and, with the tube immersed in cold water, add dropwise 8 mL of sulfuric acid. Mix well, and place the tube in a boiling water bath for exactly 3 min. Immediately transfer the tube to an ice bath until the solution is chilled. Add 0.6 mL of *Ninhydrin solution*, carefully allowing the reagent to run down the walls of the test tube. Immediately shake the tube well, and place it in a water bath at 25° for 100 min. Dilute with sulfuric acid to 25 mL. [**CAUTION**—Use sulfuric acid cautiously.] Mix by inverting the tube several times. Do not shake.

Acceptance criteria: A violet color develops within 5 min due to the presence of hydroxypropyl groups (starch ether).

ASSAY

- **ASSAY FOR HYDROXYPROPYL GROUPS**

Deuterium chloride solution: Dilute 1 mL of deuterium chloride (38% w/w) with 5 mL of deuterium oxide.

Internal standard solution: Disperse 50.0 mg of sodium 3-trimethylsilyl-1-propane sulfonate in about 5 g of deuterium oxide, weighed to the nearest 0.1 mg. Store in a sealed bottle.

Sample solution: Determine the moisture content (*B*) of 5 g of Pregelatinized Hydroxypropyl Corn Starch following the *Loss on Drying* test. Weigh 12.0 mg of Pregelatinized Hydroxypropyl Corn Starch in a 5-mm NMR tube. Add 0.75 mL of deuterium oxide and 0.1 mL of *Deuterium chloride solution*. Cap the tube, mix, and place it in a boiling water bath until a clear solution is obtained. [NOTE—This may take from 3 min to 1 h.] When a clear solution is obtained, allow it to cool to room temperature. Dry the exterior of the tube, and weigh to the nearest 0.1 mg. Add 0.05 mL of *Internal standard solution*. Weigh to the nearest 0.1 mg. Determine the mass of the *Internal standard solution* added. Mix thoroughly.

Instrumental conditions

(See *Nuclear Magnetic Resonance (761)*, *Quantitative Applications*.)

Mode: Nuclear magnetic resonance spectrometry

Apparatus: FT-NMR spectrometer at minimum 300 MHz

Acquisition of ¹H NMR spectra: The following parameters may be used:

Acceptance criteria: 2.0%–7.0% of hydroxypropyl groups on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.6%, determined on a 1.0-g test specimen

- **LIMIT OF IRON**

Standard iron stock solution: Prepare a solution containing the equivalent of 10 $\mu\text{g/mL}$ of iron, as directed under *Iron* (241).

Diluted standard iron solution: Immediately before use, dilute an accurately measured volume of the *Standard iron stock solution* quantitatively with water to obtain a solution containing the equivalent of 1 $\mu\text{g/mL}$ of iron.

Sample solution: Shake the residue obtained from the test for *Residue on Ignition* with 20 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Standard solution: Transfer 10 mL of the *Diluted standard iron solution* to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard solution*, corresponding to a limit of 20 ppm of iron.

- **LIMIT OF SULFUR DIOXIDE, Method IV** (525): NMT 50 ppm

- **LIMIT OF PROPYLENE GLYCOL**

Internal standard solution: 0.5 mg/mL of 1,3-propanediol in anhydrous pyridine

Standard stock solution: 0.5 mg/mL of USP Propylene Glycol RS in *Internal standard solution*

Standard solution: Transfer 0.1 mL of the *Standard stock solution* to a 2-mL vessel with a screw cap fitted with a septum. Add 0.9 mL of anhydrous pyridine, 0.2 mL of hexamethyldisilazane, and 0.1 mL of trimethylchlorosilane. Close, and mix. Allow to stand for 15 min before injection.

Sample stock solution: Transfer 200 mg of Pregelatinized Hydroxypropyl Corn Starch to a 100-mL volumetric flask. Add 1.0 mL of the *Internal standard solution* and 9.0 mL of anhydrous pyridine. Boil under reflux using a water bath for 20 min. Allow to cool to room temperature.

Sample solution: Transfer 1.0 mL of the *Sample stock solution* to a 2-mL vessel with a screw cap fitted with a septum. Add 0.2 mL of hexamethyldisilazane and 0.1 mL of trimethylchlorosilane. Close, and mix. Allow to stand for 15 min before injection.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm \times 30-m fused-silica capillary column; 0.25- μm layer of phase G1

Temperature

Detector: 250°

Injection port: 250°

Column: 70°. [NOTE—The column must be desorbed regularly. Conditions: Program from 70° to 300° at 7°/min, and maintain 10 min at 300°.]

Carrier gas: Helium

Flow rate: 3 mL/min

Injection type: Split ratio of 1:30

Injection size: 1 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for the trimethylsilylated derivative of propylene glycol and the trimethylsilylated derivative of 1,3-propanediol are 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the peaks due to the trimethylsilylated derivative of propylene glycol and the trimethylsilylated derivative of 1,3-propanediol

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the percentage of propylene glycol in the portion of Pregelatinized Hydroxypropyl Corn Starch taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = internal standard ratio (peak response of propylene glycol/peak response of 1,3-propanediol) from the *Sample solution*

R_S = internal standard ratio (peak response of propylene glycol/peak response of 1,3-propanediol) from the *Standard solution*

C_S = concentration of USP Propylene Glycol RS in the *Standard solution* (mg/mL)

C_U = concentration of Pregelatinized Hydroxypropyl Corn Starch in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.1%

- **LIMIT OF OXIDIZING SUBSTANCES**

Sample: 4.0 g

Analysis: Transfer the *Sample* to a glass-stoppered 125-mL conical flask, and add 50.0 mL of a mixture of water and methanol (1:1). Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine

color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate VS is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate VS is required (20 ppm, calculated as H₂O₂).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10³ cfu/g, the total combined molds and yeasts count does not exceed 10² cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*.
- **pH** (791)
Sample solution: Progressively suspend 3.0 g of Pregelatinized Hydroxypropyl Corn Starch in 100.0 mL of carbon dioxide-free water, stirring continuously. Determine the pH when all the solid is wetted.
Acceptance criteria: 4.5–8.0
- **LOSS ON DRYING** (731): Dry about 1 g at 130° for 90 min; it loses NMT 15.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)
USP Propylene Glycol RS

Hydrogenated Starch Hydrolysate

Hydrogenated Polysaccharides

Polyglucitol;
Polyglycitol syrup [68425-17-2].

DEFINITION

Hydrogenated Starch Hydrolysate is a mixture that contains NLT 50% of hydrogenated polysaccharides containing more than 3 D-glucopyranosyl units terminated with a D-glucityl unit, calculated on the anhydrous basis. Other ingredients can include sorbitol, maltitol, and other sugar polyols.

IDENTIFICATION

- **A.** It meets the requirements of the test for *Content of Maltitol and Sorbitol*.
- **B.** It meets the requirements of the test for *Content of Hydrogenated Polysaccharides*.
- **C. LIMIT OF DIETHYLENE GLYCOL AND ETHYLENE GLYCOL**
[NOTE—Perform this test for liquid products of Hydrogenated Starch Hydrolysate.]
Diluent: Acetone and water (96:4)
Standard stock solution: 0.5 mg/mL of USP Diethylene Glycol RS and 0.5 mg/mL of USP Ethylene Glycol RS in *Diluent*
Internal standard stock solution: 0.5 mg/mL of 1,3-butanediol (internal standard) in *Diluent*
Standard solution: 0.04 mg/mL of USP Diethylene Glycol RS, 0.04 mg/mL of USP Ethylene Glycol RS, and 0.04 mg/mL of 1,3-butanediol (internal standard), in *Diluent*, prepared from the *Standard stock solution* and the *Internal standard stock solution*

Sample solution: Transfer 1.0 g of Hydrogenated Starch Hydrolysate to a 25-mL volumetric flask. Add 1.0 mL of water to the flask, and mix on a vortex mixer for 3 min. Add 2.0 mL of the *Internal standard stock solution*, and add the remaining *Diluent* to the flask in three equal portions to volume. Mix the contents for about 3 min after each addition of *Diluent*. Pass a portion of the supernatant layer through a nylon filter of 0.45-µm pore size. Discard the first 2 mL of the filtrate, and collect the rest of the filtrate for analysis. [NOTE—Acetone is used to precipitate sugar alcohols.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 15-m fused-silica capillary; 0.25-µm layer of phase G46

Temperature

Detector: 300°

Injection port: 240°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	2
70	50	300	5

Carrier gas: Helium

Flow rate: 3.0 mL/min

Injection size: 1.0 µL

Injection type: Split injection. The split ratio is about 10:1. [NOTE—A general-purpose split/splitless, tapered, glass wool, deactivated liner is used.]

System suitability

Sample: *Standard solution*

[NOTE—See *Table 2*. Relative retention times are provided for information only, and the standards should be used to ensure appropriate peak identification.]

Table 2

Name	Relative Retention Time
Ethylene glycol	1.0
1,3-Butanediol (internal standard)	2.0
Diethylene glycol	2.5

Suitability requirements

Resolution: NLT 15 between ethylene glycol and 1,3-butanediol

Analysis

Samples: *Standard solution* and *Sample solution*

Based on the *Standard solution*, identify the peaks of ethylene glycol, 1,3-butanediol (internal standard), and diethylene glycol. Compare peak area ratios of ethylene glycol to the internal standard and of diethylene glycol to the internal standard in the *Standard solution* and *Sample solution*, respectively.

Acceptance criteria

Diethylene glycol: The peak area ratio of diethylene glycol to the internal standard in the *Sample solution* is NMT the peak area ratio of diethylene glycol to the internal standard in the *Standard solution*, corresponding to NMT 0.10% of diethylene glycol in Hydrogenated Starch Hydrolysate.

Ethylene glycol: The peak area ratio of ethylene glycol to the internal standard in the *Sample solution* is NMT the peak area ratio of ethylene glycol to the internal standard in the *Standard solution*, corresponding to

NMT 0.10% of ethylene glycol in Hydrogenated Starch Hydrolysate.

ASSAY

• CONTENT OF MALTITOL AND SORBITOL

Mobile phase: Degassed water

Standard solution: Dissolve accurately weighed quantities of USP Maltose Monohydrate RS, USP Maltitol RS, USP Dextrose RS, and USP Sorbitol RS in water to obtain a solution having known concentrations of about 1.0 mg/mL for each, calculated on the anhydrous basis.

Sample solution: Transfer a quantity of Hydrogenated Starch Hydrolysate, equivalent to 100 mg on the anhydrous basis, to a 100-mL volumetric flask. Dilute with water to volume, and mix. Transfer approximately 10 mL of the solution into a separate container, shake the solution for 30 s, pass through a filter of 0.45-μm or finer pore size into a suitable autosampler vial, and seal.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.7-mm × 30-cm; packing L58

Temperature

Detector: 40°

Column: 80°, controlled within ±2°

Flow rate: 0.3 mL/min

Injection size: 50 μL

System suitability

Sample: *Standard solution*

[NOTE—See *Table 3* for relative retention times.]

Table 3

Name	Relative Retention Time
Maltose	0.81
Maltitol	0.84
Dextrose	0.94
Sorbitol	1.00

[NOTE—Sorbitol is the last peak to elute.]

System suitability requirements

Relative standard deviation: NMT 2.0% for the maltitol peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each component, maltose (P_{M1}), maltitol (P_{M2}), dextrose (P_D), and sorbitol (P_S), in the solid portion of Hydrogenated Starch Hydrolysate taken:

$$\text{Result} = V \times (r_U/r_S) \times (C/W) \times 100$$

V = volume of the *Sample solution*, 100 mL

r_U = peak response for the respective component (maltose, maltitol, dextrose, sorbitol) from the *Sample solution*

r_S = peak response for the respective component (maltose, maltitol, dextrose, sorbitol) from the *Standard solution*

C = concentration of the respective component (maltose, maltitol, dextrose, sorbitol) in the *Standard solution* (mg/mL)

W = weight of Hydrogenated Starch Hydrolysate that was taken to prepare the *Sample solution* (mg), calculated on the anhydrous basis

Acceptance criteria: Less than 50% of total maltitol and sorbitol and less than 1% of total maltose and dextrose, on the anhydrous basis

• CONTENT OF HYDROGENATED POLYSACCHARIDES

Mobile phase, Standard solution, Sample solution, and Chromatographic system: Prepare as directed in the test for *Content of Maltitol and Sorbitol*.

Analysis

Samples: *Standard solution* and *Sample solution*

Inject a volume (about 50 μL) of the *Sample solution*, and measure all the peak areas. The elution pattern includes the higher-molecular-weight hydrogenated polysaccharides containing more than 11 D-glucopyranosyl units, followed by some individual peaks representing hydrogenated polysaccharides containing NMT 10 D-glucopyranosyl units, if this hydrogenated species is present. The higher-molecular-weight hydrogenated polysaccharides containing more than 11 D-glucopyranosyl units can be integrated into one peak; the relative retention time is about 0.29 relative to the peak of sorbitol. The relative retention times for hydrogenated polysaccharides containing NMT 10 D-glucopyranosyl units are given in *Table 4*.

Table 4

Hydrogenated Species for Degree of Polymerization (DP)	Relative Retention Time
Sorbitol (HDP 1)	1.00
Maltitol (HDP 2)	0.84
Maltotriitol (HDP 3)	0.72
Maltotetraitol (HDP 4)	0.64
Maltopentaitol (HDP 5)	0.58
Maltohexaitol (HDP 6)	0.53
Maltoheptaitol (HDP 7)	0.48
Maltooctaitol (HDP 8)	0.45
Maltononaitol (HDP 9)	0.42
Maltodecailol (HDP 10)	0.40

Calculate the percentage of hydrogenated polysaccharides containing more than 3 D-glucopyranosyl units in the solid portion of Hydrogenated Starch Hydrolysate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = sum of peak areas of hydrogenated polysaccharides containing more than 3 D-glucopyranosyl units from the *Sample solution*

r_T = sum of all the peak areas from the *Sample solution*

Acceptance criteria: NLT 50% of hydrogenated polysaccharides containing more than 3 D-glucopyranosyl units, on the anhydrous basis

IMPURITIES

• **RESIDUE ON IGNITION (281):** NMT 0.15%, ignition of a quantity of Hydrogenated Starch Hydrolysate equivalent to 1.0 g of solid, on the anhydrous basis

• LIMIT OF CHLORIDE

Sample solution: Transfer a quantity of Hydrogenated Starch Hydrolysate, equivalent to 25 g on the anhydrous basis, to a beaker, add 100 mL of water, and stir until the Hydrogenated Starch Hydrolysate is completely dissolved.

Analysis: Add 1.0 mL of potassium chromate indicator solution (1 in 20) to the *Sample solution*. Slowly titrate with 0.1 N silver nitrate VS until a reddish-orange color persists.

Calculate the quantity, in μg, of chloride in each g of Hydrogenated Starch Hydrolysate taken:

$$\text{Result} = (F \times M_r \times N \times V)/W$$

F = factor converting mg to μg, 10³ μg/mg

M_r = molar mass of chloride, 35.45

- N* = exact normality of the silver nitrate solution
V = volume of the silver nitrate solution consumed in the titration (mL)
W = weight of Hydrogenated Starch Hydrolysate taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 50 µg/g (ppm) of chloride

- **CHLORIDE AND SULFATE, Sulfate (221):** 1.0 g of the solid portion of Hydrogenated Starch Hydrolysate shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid: NMT 100 µg/g (ppm) of sulfate is found.
- **LIMIT OF NICKEL**

[NOTE—When water is specified as the diluent, use deionized ultra-filtered water.]

Digester solution (aqua regia): Add 360 mL of hydrochloric acid and 240 mL of nitric acid to 1200 mL of water.

Blank solution: Add 40 mL of nitric acid to a 2-L volumetric flask, dilute with water to volume, and mix well.

Internal standard solution: Transfer 2.0 mL of commercially prepared yttrium reference standard solution (1000 ppm) to a 1-L volumetric flask, dilute with *Blank solution* to volume, and mix well. The *Internal standard solution* contains 2 µg/mL of yttrium.

Standard stock solution: [NOTE—Prepare this solution fresh every two months.] Quantitatively dilute an accurately measured volume of a commercially prepared nickel ICP standard (1000 ppm) with *Blank solution* to obtain a solution containing 10 µg/mL of nickel (*Standard stock solution 10 ppm*).

Standard solutions: [NOTE—Prepare these solutions fresh weekly.] Separately pipet 1.0, 2.0, and 4.0 mL of *Standard stock solution*, respectively, into three 200-mL volumetric flasks. Dilute the content in each flask with *Blank solution* to volume, and mix well. These are, respectively, the *Standard nickel solution 50 ppb*, *Standard nickel solution 100 ppb*, and *Standard nickel solution 200 ppb*.

Sample solution: Transfer a quantity of Hydrogenated Starch Hydrolysate, equivalent to 10.0 g on the anhydrous basis, into a 125-mL conical flask. Add 40 mL of *Digester solution*, and place on a hot plate. Heat the solution for about 20 min, being careful to prevent the solution from boiling over. Pull the sample off the hot plate just before it turns a dark caramel color. [NOTE—Do not overburn the sample.] Transfer the flask's contents into a clean, dry, 50-mL volumetric flask with washings of *Blank solution*. Dilute with *Blank solution* to volume. Filter the sample into a 15-mL centrifuge tube, using a 10-mL BD syringe fitted with a syringe filter of 0.45-µm pore size.

Instrumental conditions

(See *Plasma Spectrochemistry* (730).)

Mode: Inductively coupled plasma–optical emission spectroscopy (ICP–OES) configured in an axial optical alignment

Detector: Set a UV detector to scan nickel at 232.005 nm and yttrium at 371.029 nm, and set the sample read time to 10 s minimum and 50 s maximum.

Analysis

Samples: *Blank solution*, *Standard solutions*, and *Sample solution*

Take three replicate scans with the integration set to one point per peak. Set forward power from the RF generator to 1500 watts. The argon plasma feed gas flows at 15 L/min with the auxiliary gas (shear gas) set to flow at 0.5 L/min. Use a gem cone nebulizer with a nebulization gas flow rate of 0.55 L/min. Deliver the sample to the spray chamber with a multichannel peristaltic pump set to deliver sample at a rate of 1.00 mL/min. Add the *Internal standard solution* in-line via a mixing block between the sample probe and the spray chamber. Flush the samples through the system for 30 s at a rate of 4.0 mL/min before analysis. Program a 60-s read delay into the sampling routine to

allow for fluid flow equilibration after the high-speed flush, before the first analytical read of the sample. Between samples, wash the pumping system by flushing the *Blank solution* for 30 s at a rate of 4.0 mL/min.

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check.

Generate the calibration curve using the *Blank solution*, *Standard nickel solution 50 ppb*, *Standard nickel solution 100 ppb*, and *Standard nickel solution 200 ppb* as follows. Scan the *Internal standard solution* while running the *Blank solution* to measure the intensity of the yttrium emission. Hold this value constant throughout the remainder of the test. Separately scan the *Blank solution*, *Standard nickel solution 50 ppb*, *Standard nickel solution 100 ppb*, and *Standard nickel solution 200 ppb* for nickel and yttrium. [NOTE—Add the *Internal standard solution* via an in-line mixing chamber.] Normalize the yttrium intensity to the value of the *Internal standard solution*. Apply this normalization factor to the nickel intensity, which is then referred to as the corrected nickel intensity. Construct a calibration curve by plotting the corrected nickel intensity versus the known concentrations, in ng/mL, of the nickel: the linear regression coefficient is NLT 0.999.

Similarly, analyze the *Sample solution* on the ICP. Plot the intensity of the emission of the *Sample solution* on the calibration curve. Obtain the concentration of nickel, *C*, in ng/mL, in the *Sample solution* through the calibration curve.

Calculate the content, in µg/g, of nickel in the solid portion of Hydrogenated Starch Hydrolysate taken:

$$\text{Result} = F \times V \times (C/W)$$

- F* = factor converting ng to µg, 10^{-3} µg/ng
V = volume of the *Sample solution*, 50 mL
C = concentration of nickel in the *Sample solution* (ng/mL)
W = weight of Hydrogenated Starch Hydrolysate calculated on the anhydrous basis (g)

Acceptance criteria: Nickel content is NMT 1 µg/g (ppm).

• LIMIT OF REDUCING SUGARS

Analysis: Dissolve a quantity of Hydrogenated Starch Hydrolysate, equivalent to 1.0 g on the anhydrous basis, in 6 mL of water with the aid of gentle heat, if necessary. Cool, and add 20.0 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 min, and maintain boiling for 3 min. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS, using 2 mL of starch TS as an indicator, added toward the end of the titration.

Acceptance criteria: NLT 12.8 mL of 0.05 N sodium thiosulfate, corresponding to NMT 1% of reducing sugars

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **PH (791):** 3.0–7.0, in a 20% (w/w) solution in freshly boiled and cooled water

- **WATER DETERMINATION, Method I (921)**
For dried powder product: NMT 6.0%
For liquid product: Within ± 1.5 units of the labeled value

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified for liquid product; protect from moisture for dried powder product.
- **LABELING:** Label it to indicate *Water* content, as the percentage of water, for liquid product.
- **USP REFERENCE STANDARDS (11)**
USP Dextrose RS
USP Diethylene Glycol RS
USP Ethylene Glycol RS
USP Maltitol RS
USP Maltose Monohydrate RS
USP Sorbitol RS

Modified Starch

DEFINITION

Modified Starch is Starch modified by chemical means. Food Starch may be acid-modified, bleached, oxidized, esterified, etherified, or treated enzymatically to change its functional properties (21 CFR 172.892).

IDENTIFICATION

- **A.**
Corn starch: Polygonal, rounded, or spheroidal granules up to 35 μm in diameter and usually having a circular or several-rayed central cleft
Tapioca starch: Spherical granules with one truncated side, typically 5–35 μm in diameter and usually having a circular or several-rayed central cleft
Potato starch: Irregularly shaped, ovoid, or pear-shaped granules, usually 30–100 μm in size but occasionally exceeding 100 μm ; or rounded, 10–35 μm in size. There are occasional compound granules having two to four components. The ovoid and pear-shaped granules have an eccentric hilum, and the rounded granules have an accentric or slightly eccentric hilum. All granules show clearly visible concentric striations.
Wheat starch: Large and small granules, usually 10–60 μm in diameter. The central hilum and striations are visible or barely visible.
- **B.**
Sodium hydroxide solution: 2% (w/w)
Sample: 0.6 g
Analysis: Transfer the *Sample* to a 25-mL glass vial with a plastic cap. Add 9.4 g of water, cap, and shake vigorously to evenly disperse the starch. Add 10 g of the *Sodium hydroxide solution*, cap, and shake vigorously for 1 min to create a smooth mixture. Evaluate within 1 min.
Acceptance criteria: The final solution is translucent to opaque with a fluid consistency. A yellow tint of the final solution is acceptable.
- **C.** A water slurry of the Modified Starch is colored orange-red to deep blue by iodine TS.

IMPURITIES

- **RESIDUE ON IGNITION (281)**
Sample: 2.0 ± 0.1 g
Analysis: Proceed as directed in the chapter.
Acceptance criteria: NMT 1.5%
- **IRON (241)**
Test preparation: Dissolve the residue obtained in the test for *Residue on Ignition* in 8 mL of hydrochloric acid

with the aid of gentle heating. Dilute with water to 100 mL in a volumetric flask, and mix. Dilute 25 mL of this solution with water to 47 ± 1 mL.

Analysis: Proceed as directed in the chapter.

Acceptance criteria: NMT 20 ppm

- **LIMIT OF SULFUR DIOXIDE**

Sample: 20.0 ± 0.1 g

Analysis: Mix the *Sample* with 200 mL of 5% alcohol until a smooth suspension is obtained, and vacuum-filter through paper (Whatman No.1 or equivalent). To 100 mL of the filtrate add 3 mL of starch TS, and titrate with 0.01 N iodine VS to the first permanent blue color.

Acceptance criteria: NMT 1.7 mL of 0.01 N iodine VS is consumed, which corresponds to NMT 50 ppm of sulfur dioxide being found.

- **OXIDIZING SUBSTANCES**

Sample: 4.0 g

Titrimetric system

Mode: Direct titration

Titrant: 0.002 N sodium thiosulfate VS

Blank: 30.0 mL of water, accurately measured

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with *Titrant* to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 μg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 12.6 mL of 0.002 N sodium thiosulfate is required (180 ppm, calculated as H_2O_2), which corresponds to NMT 0.018% of oxidizing substances

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **pH (791)**
Sample: 20.0 ± 0.1 g
Analysis: Transfer the *Sample* to a suitable nonmetallic container, and add 100 mL of water to obtain a slurry. Stir using a magnetic stirrer at a moderate rate for 5 min, and determine the pH to the nearest 0.1 unit.
Acceptance criteria: 3.0–9.0
- **LOSS ON DRYING (731)**
Analysis: Dry a sample at 120° for 4 h.
Acceptance criteria
Corn starch and Wheat starch: NMT 15.0%
Tapioca starch: NMT 18.0%
Potato starch: NMT 21.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

Pea Starch

DEFINITION

Pea Starch is obtained from the seeds of *Pisum sativum* L.

IDENTIFICATION

- **A.** Examined under a microscope using a mixture of equal volumes of glycerin and water, it presents a majority of large elliptical granules, 25-45 μm in size, sometimes irregular, or reniform. It also presents a minority of small rounded granules, 5-8 μm in size. Granules can present cracks or irregularities. Sometimes, granules show barely visible concentric striations. Exceptionally, granules show a slit along the main axis. Between orthogonally oriented polarizing plates or prisms, the granules show a distinct black cross.
- **B.** Suspend 1 g of it in 50 mL of water, boil for 1 min, and cool: a thin, cloudy mucilage is formed.
- **C.** To 1 mL of the mucilage obtained in *Identification test B* add 0.05 mL of iodine and potassium iodide TS 2: an orange-red to dark blue color is produced, which disappears on heating.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.6%, determined on a 1.0-g sample
- **LIMIT OF IRON**

Standard iron stock solution: Prepare a solution containing the equivalent of 10 $\mu\text{g}/\text{mL}$ of iron, as directed under *Iron* (241).

Diluted standard iron solution: Immediately before use, dilute a measured volume of *Standard iron stock solution* quantitatively with water to obtain a solution containing the equivalent of 1 $\mu\text{g}/\text{mL}$ of iron.

Standard solution: Transfer 10 mL of the *Diluted standard iron solution* to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Sample solution: Shake 1.0 g of Pea Starch with 50 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard solution*, corresponding to a limit of 50 $\mu\text{g}/\text{g}$ of iron.

- **LIMIT OF SULFUR DIOXIDE**

[NOTE—Perform either *Test 1* or *Test 2*.]

Test 1

Carbon dioxide: Use carbon dioxide with a flow regulator that will maintain a flow of 100 ± 10 mL/min.

Hydrogen peroxide solution: Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Neutralize the solution with 0.01 N sodium hydroxide to a pH of 4.1, determined potentiometrically.

Potassium metabisulfite solution: Transfer 0.87 g of potassium metabisulfite ($\text{K}_2\text{S}_2\text{O}_5$) and 0.2 g of edetate disodium to a 1000-mL volumetric flask. Dilute with water to volume before mixing. [NOTE—Edetate disodium is used to protect the sulfite ion from oxidation.]

Apparatus: In this test, the sulfur dioxide is released from the sample in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. A suitable apparatus for sulfur dioxide determination is shown in the accompanying diagram (Figure 1).

Figure 1

The apparatus consists of a 500-mL three-neck, round-bottom boiling flask, A; a separatory funnel, B, having a capacity of 100 mL or greater; a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask; a reflux condenser, C, having a jacket length of 200 mm; and a delivery tube, E, connecting the upper end of the reflux condenser to the bottom of a receiving test tube, D. Apply a thin film of stopcock grease to the sealing surfaces of all the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

System suitability test

Test A: Using the *Potassium metabisulfite solution* as the standard, proceed as directed in *Analysis*, except for replacing the 25.0 g of Pea Starch with 20 mL of the *Potassium metabisulfite solution*.

Calculate the content, in $\mu\text{g}/\text{mL}$, of sulfur dioxide in the *Potassium metabisulfite solution* taken:

$$\text{Result} = (F \times \text{MW} \times V \times N) / V_p$$

F = factor for conversion of mg to μg , 1000
MW = milliequivalent weight of sulfur dioxide, 32.03

V = volume of titrant consumed (mL)

N = normality of the titrant

V_p = volume of the *Potassium metabisulfite solution* taken for the test (mL)

Test B: In a 100-mL conical flask, add 20 mL of 0.02 N iodine solution and 5 mL of 2 N hydrochloric acid. Add 1 mL of starch TS, and titrate with *Potassium metabisulfite solution* until the first discoloration is observed.

Calculate the content, in $\mu\text{g}/\text{mL}$, of sulfur dioxide in the *Potassium metabisulfite solution*:

$$\text{Result} = (F \times \text{MW} \times V_i \times N_i) / V_p$$

F = factor for conversion of mg to μg , 1000

MW = milliequivalent weight of sulfur dioxide, 32.03

V_i = the volume of the iodine solution used in the test (mL)

N_i = normality of the iodine solution

V_p = volume of the *Potassium metabisulfite solution* consumed (mL)

The difference between the sulfur dioxide contents obtained from *Test A* and *Test B* is NMT 5% of their mean value. *Test B* shall be performed within 15 min after the completion of *Test A*. [NOTE—This time limit avoids potential variation in the sulfur dioxide content of the *Potassium bisulfite solution* when stored at room temperature.]

Analysis: Add 150 mL of water to the boiling flask (A) (see *Figure 1*). Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide through the apparatus at a rate of 100 ± 5 mL/min. Start the condenser coolant flow. Place 10 mL of *Hydrogen peroxide solution* in the receiving test tube (D). After 15 min, without interrupting the flow of carbon dioxide, remove the separatory funnel (B) from the boiling flask, and transfer 25.0 g of Pea Starch to the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 h. Open the stopcock of the funnel, stop the flow of carbon dioxide, discontinue heating the flask, and turn off the cooling water in the condenser. Remove the receiving test tube, and transfer its contents to a 200-mL wide-necked conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 min, and allow to cool. Titrate the contents with 0.1 N sodium hydroxide VS until the pH reaches 4.1, determined potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Calculate the content, in $\mu\text{g/g}$, of sulfur dioxide in the Pea Starch taken:

$$\text{Result} = (F \times \text{MW} \times V \times N)/W$$

F = factor for conversion of mg to μg , 1000
 MW = milliequivalent weight of sulfur dioxide, 32.03
 V = volume of titrant consumed (mL)
 N = normality of the titrant
 W = weight of the Pea Starch taken (g)

Test 2: Determine the content of sulfur dioxide as directed under *Sulfur Dioxide* (525), *Method I*. Use 200 mL of water as a solvent. Then, to 100 mL of the clear filtrate, add 3 mL of starch TS, and titrate with 0.01 N iodine VS to the first permanent blue color.

Acceptance criteria: NMT 50 $\mu\text{g/g}$ of sulfur dioxide

Organic Impurities

• PROCEDURE 1: LIMIT OF OXIDIZING SUBSTANCES

Sample: 4.0 g of Pea Starch

Analysis: Transfer the *Sample* to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate VS is equivalent to 34 μg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate VS is required (20 $\mu\text{g/g}$, calculated as H_2O_2).

• PROCEDURE 2: FOREIGN MATTER

Analysis: Examine under a microscope, using a mixture of equal volumes of glycerin and water.

Acceptance criteria: NMT traces of matter other than starch granules are present. No starch grains of any other origin are present.

SPECIFIC TESTS

• MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):

The total aerobic microbial count does not exceed 1000 cfu/g, the total combined molds and yeasts count does not exceed 100 cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*.

• pH (791)

Sample solution: Prepare a slurry by weighing 5.0 g of Pea Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water.

Analysis: Agitate continuously at a moderate rate for 1 min. Stop the agitation, allow to stand for 15 min, and shake again. Determine the pH to the nearest 0.1 unit: the pH is determined potentiometrically.

Acceptance criteria: 5.0–8.0

• LOSS ON DRYING (731):

Dry about 1 g at 130° for 90 min: it loses NMT 16.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

Hydroxypropyl Pea Starch

For the Amylose derivative, *m* is about 300–1000.

DEFINITION

Hydroxypropyl Pea Starch is partially substituted 2-hydroxypropylether obtained from pea starch by a chemical modification of etherification with propylene oxide. In addition, this starch may be partially hydrolyzed using acids or enzymes to obtain thinned starch. It contains NLT 2.0% and NMT 7.0% of hydroxypropyl groups, on the dried basis.

IDENTIFICATION

• A. PROCEDURE

Analysis: Examine under a microscope, using NLT 20 \times magnification and a mixture of glycerin and water (1:1) as a mounting agent.

Acceptance criteria: It presents a majority of large elliptical granules 25–45 μm in size, sometimes irregular or reniform. It also presents a minority of small rounded granules 5–8 μm in size. Granules can present cracks or irregularities. Sometimes, granules show barely visible concentric striations. Exceptionally, granules show a slit along the main axis. Between orthogonally oriented polarizing plates or prisms, the granules show a distinct black cross.

• B. PROCEDURE

Sample solution: Suspend 1 g of Hydroxypropyl Pea Starch in 50 mL of water, boil for 1 min, and cool.

Acceptance criteria: A translucent or clear mucilage is formed.

• **C. PROCEDURE**

Analysis: To 1 mL of the *Sample solution* obtained in Identification test B add 0.05 mL of iodine and potassium iodide TS 2.

Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

• **D. PROCEDURE**

Ninhydrin solution: Dissolve 3 g of ninhydrin in 100 mL of a 45.5-g/L solution of sodium metabisulfite.

Diluted sulfuric acid: 98 g/L of H₂SO₄

Sample: 100 mg of Hydroxypropyl Pea Starch

Analysis: Transfer the *Sample* to a 100-mL volumetric flask, and add 12.5 mL of *Diluted sulfuric acid*. Place the flask in a water bath, and heat until the *Sample* is dissolved. Cool, and dilute with water to 100 mL. [**CAUTION**—When sulfuric acid is miscible with water, it produces intense heat.]

Pipet 1 mL of this solution to a glass-stoppered, 25-mL graduated test tube and, with the tube immersed in cold water, add drop-wise 8 mL of sulfuric acid. Mix well, and place the tube in a boiling water bath for exactly 3 min. Immediately transfer the tube to an ice bath until the solution is chilled. Add 0.6 mL of *Ninhydrin solution*, carefully allowing the reagent to run down the walls of the test tube. Immediately shake the tube well, and place it in a water bath at 25° for 100 min. Dilute with sulfuric acid to 25 mL [**CAUTION**—Use sulfuric acid cautiously.], and mix by inverting the tube several times. Do not shake.

Acceptance criteria: A violet color develops within 5 min due to the presence of hydroxypropyl groups (starch ether).

ASSAY

• **PROCEDURE FOR HYDROXYPROPYL GROUPS**

Deuterium chloride solution: Dilute 1 mL of deuterium chloride (38% w/w) with 5 mL of deuterium oxide.

Internal standard solution: Dissolve 50.0 mg of sodium 3-trimethylsilyl-1-propane sulfonate in about 5 g of deuterium oxide, weighed to the nearest 0.1 mg. Store in a sealed bottle.

Sample solution: Disperse 20 g of Hydroxypropyl Pea Starch in 200.0 mL of carbon dioxide-free water at room temperature. Agitate for 15 min, and filter. Repeat the operation two more times. If poor dispersibility or slow filtration is observed, use refrigerated carbon dioxide-free water for the washing operation. Dry the washed starch for NLT 4 h in vacuum at 30 ± 5°. Weigh 12.0 mg of this sample in a 5-mm NMR tube. Add 0.75 mL of deuterium oxide and 0.1 mL of *Deuterium chloride solution*. Cap the tube, mix, and place it in a boiling water bath until a clear solution is obtained. [NOTE—This may take 3 min to 1 h.] When a clear solution is obtained, allow to cool to room temperature. Dry the exterior of the tube, and weigh to the nearest 0.1 mg. Add 0.05 mL of *Internal standard solution*, and weigh to the nearest 0.1 mg. Determine the mass of the *Internal standard solution* added. Mix thoroughly.

Nuclear magnetic resonance spectrometry

(See *Nuclear Magnetic Resonance* (761), *Quantitative Application*.)

Apparatus: FT-NMR spectrometer at minimum 300 MHz

Acquisition of ¹H NMR spectra: The following parameters may be used.

Sweep width: 8 ppm (about -1.0 to +7 ppm)

Irradiation frequency offset: None

Time domain: NLT 64 K

Pulse width: 90 degree

Pulse delay: 10 s

Dummy scans: 0

Number of scans: 8

Use the CH₃ signal of the internal standard for shift referencing. Set the shift of the peak of the singlet to 0 ppm. Record the FID signal.

Analysis

Samples: *Internal standard solution* and *Sample solution*
Call the integration sub-routine after phase corrections and baseline correction between -0.5 and +6 ppm. Measure the peak areas of the doublet from the methyl groups of the hydroxypropyl function at +1.2 ppm (A₂), and of the methyl groups at 0 ppm of the internal standard (A₁) without ¹³C-satellites.

Measure the signal coming from the 3 protons of the methyl group in the hydroxypropyl function. Calculate the content of hydroxypropyl groups as a percentage (w/w, dried basis):

$$\text{Result} = \left(N \times A_2 / A_1 \right) \times \left(C_i \times W_i / W \right) \times \left(M_{r2} / M_{r1} \right) \times \left[100 / (100 - B) \right] \times 100$$

- N = numerical value representing the 3 methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate), 3
A₂ = area of the methyl groups of hydroxypropyl in Hydroxypropyl Pea Starch
A₁ = area of the methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate)
C_i = concentration of the internal standard in the *Internal standard solution* (mg/g)
W_i = weight of the *Internal standard solution* in the NMR tube (g)
W = weight of the washed and dried Hydroxypropyl Pea Starch in the NMR tube (mg)
M_{r1} = molecular weight of the internal standard, 218.32 g/mol
M_{r2} = molar mass of hydroxypropyl group, 59.09 g/mol
B = moisture content of the washed and dried Hydroxypropyl Pea Starch used in the *Sample solution*, as a percentage (w/w)

Acceptance criteria: The content of hydroxypropyl groups is 2.0%–7.0%.

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION (281):** NMT 0.6%, determined on a 1.0-g test specimen

• **LIMIT OF IRON**

Standard iron stock solution: Prepare a solution containing the equivalent of 10 µg/mL of iron, as directed under *Iron* (241).

Diluted standard iron solution: Immediately before use, dilute an accurately measured volume of *Standard iron stock solution* quantitatively with water to obtain a solution containing the equivalent of 1 µg/mL of iron.

Standard solution: Transfer 10 mL of the *Diluted standard iron solution* to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Sample solution: Shake 1.0 g of Hydroxypropyl Pea Starch with 50 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard solution*, corresponding to a limit of 50 µg/g of iron.

• **LIMIT OF SULFUR DIOXIDE, Method IV (525):** NMT 50 ppm
Organic Impurities

• **PROCEDURE 1: LIMIT OF OXIDIZING SUBSTANCES**

Sample: 4.0 g of Hydroxypropyl Pea Starch

Analysis: Transfer the *Sample* to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate VS is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate VS is required (20 µg/g, calculated as H₂O₂).

• **PROCEDURE 2: FOREIGN MATTER**

Sample: 50 mg/mL of Hydroxypropyl Pea Starch in a mixture of glycerin and water (1:1)

Analysis: Examine under a microscope, using NLT 20× magnification and a mixture of glycerin and water (1:1) as a mounting agent.

Acceptance criteria: NMT traces of matter other than Hydroxypropyl Pea Starch granules are present.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10³ cfu/g, the total combined molds and yeasts count does not exceed 10² cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*.

• **PH (791)**

Sample solution: Suspend 5.0 g of Hydroxypropyl Pea Starch in 25.0 mL of carbon dioxide-free water, and shake for 60 s. Allow to stand for 15 min.

Acceptance criteria: 4.5–8.0

- **LOSS ON DRYING (731):** Dry about 1 g at 130° for 90 min: it loses NMT 15.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

Pregelatinized Hydroxypropyl Pea Starch

DEFINITION

Pregelatinized Hydroxypropyl Pea Starch is prepared from Hydroxypropyl Pea Starch by mechanical processing in the presence of water, with or without heat, to rupture all or some of the starch granules, and is subsequently dried. It contains NLT 2.0% and NMT 7.0% of hydroxypropyl groups on the dried basis.

IDENTIFICATION

• **A. TEST FOR PREGELATINIZED STATE**

Sample: 1 g

Analysis: Disperse the *Sample* in 50 mL of water at a temperature NMT 25°. Shake vigorously until lumps completely disperse/solubilize or until lumps disappear. Allow to stand for 20 min.

Acceptance criteria: A translucent or clear mucilage without precipitate is formed.

• **B. TEST FOR STARCH**

Analysis: Disperse 0.5 g in 2 mL of water without heating, and add 0.05 mL of iodine and potassium iodide TS₂.

Acceptance criteria: A reddish-violet or blue color is produced.

• **C. NINHYDRIN TEST**

Ninhydrin solution: Dissolve 3 g of ninhydrin in 100 mL of a 45.5-g/L solution of sodium metabisulfite.

Diluted sulfuric acid: 98 g/L of H₂SO₄

Sample: 100 mg

Analysis: Transfer the *Sample* to a 100-mL volumetric flask and add 12.5 mL of *Diluted sulfuric acid*. Place the flask in a water bath, and heat until the *Sample* is dissolved. Cool, and dilute with water to 100 mL. [**CAUTION**—When sulfuric acid is miscible with water, it produces intense heat.]

Pipet 1 mL of this solution to a glass-stoppered 25-mL graduated test tube and, with the tube immersed in cold water, add dropwise 8 mL of sulfuric acid. Mix well, and place the tube in a boiling water bath for exactly 3 min. Immediately transfer the tube to an ice bath until the solution is chilled. Add 0.6 mL of *Ninhydrin solution*, carefully allowing the reagent to run down the walls of the test tube. Immediately shake the tube well, and place it in a water bath at 25° for 100 min. Dilute with sulfuric acid to 25 mL. [**CAUTION**—Use sulfuric acid cautiously.] Mix by inverting the tube several times. Do not shake.

Acceptance criteria: A violet color develops within 5 min due to the presence of hydroxypropyl groups (starch ether).

ASSAY

• **ASSAY FOR HYDROXYPROPYL GROUPS**

Deuterium chloride solution: Dilute 1 mL of deuterium chloride (38% w/w) with 5 mL of deuterium oxide.

Internal standard solution: Disperse 50.0 mg of sodium 3-trimethylsilyl-1-propane sulfonate in about 5 g of deuterium oxide, weighed to the nearest 0.1 mg. Store in a sealed bottle.

Sample solution: Determine the moisture content (*B*) on 5 g of Pregelatinized Hydroxypropyl Pea Starch following the *Loss on Drying* test. Weigh 12.0 mg of the Pregelatinized Hydroxypropyl Pea Starch in a 5-mm NMR tube. Add 0.75 mL of deuterium oxide and 0.1 mL of *Deuterium chloride solution*. Cap the tube, mix, and place it in a boiling water bath until a clear solution is obtained. [NOTE—This may take from 3 min to 1 h.] When a clear solution is obtained, allow to cool to room temperature. Dry the exterior of the tube, and weigh to the nearest 0.1 mg. Add 0.05 mL of the *Internal standard solution*. Weigh to the nearest 0.1 mg. Determine the mass of the *Internal standard solution* added. Mix thoroughly.

Instrumental conditions

(See *Nuclear Magnetic Resonance (761)*, *Quantitative Applications*.)

Mode: Nuclear magnetic resonance spectrometry

Apparatus: FT-NMR spectrometer at minimum 300 MHz

Acquisition of ¹H NMR spectra: The following parameters may be used:

Sweep width: 8 ppm (about –1.0 to +7 ppm)

Irradiation frequency offset: None

Time domain: NLT 64 K

Pulse width: 90°

Pulse delay: 10 s

Dummy scans: 0

Number of scans: 8

Use the CH₃ signal of the internal standard for shift referencing. Set the shift of the peak of the singlet to 0 ppm. Record the FID signal.

Analysis

Samples: *Internal standard solution* and *Sample solution*
 Call the integration subroutine after phase corrections and baseline correction between -0.5 and +6 ppm. Measure the peak areas of the doublet from the methyl groups of the hydroxypropyl function at +1.2 ppm (A_2), and of the methyl groups at 0 ppm of the internal standard (A_1) without ^{13}C -satellites. Measure the signal originating from the 3 protons of the methyl group in the hydroxypropyl function. Calculate the content of hydroxypropyl groups as a percentage (w/w, dried basis):

$$\text{Result} = (N \times A_2/A_1) \times (C_i \times W_i/W) \times (M_{r2}/M_{r1}) \times [100/(100 - B)] \times 100$$

- N = numerical value representing the 3 methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate), 3
 A_2 = area of the methyl groups of hydroxypropyl in Pregelatinized Hydroxypropyl Pea Starch
 A_1 = area of the methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate)
 C_i = concentration of the internal standard in the *Internal standard solution* (mg/g)
 W_i = weight of the *Internal standard solution* in the NMR tube (g)
 W = weight of the Pregelatinized Hydroxypropyl Pea Starch in the NMR tube (mg)
 M_{r2} = molar mass of hydroxypropyl groups, 59.09 g/mol
 M_{r1} = molecular weight of the internal standard, 218.32 g/mol
 B = moisture content of the Pregelatinized Hydroxypropyl Pea Starch used in the *Sample solution*, as a percentage (w/w)

Acceptance criteria: 2.0%–7.0% of hydroxypropyl groups on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.6%, determined on a 1.0-g test specimen

- **LIMIT OF IRON**

Standard iron stock solution: Prepare a solution containing the equivalent of 10 µg/mL of iron, as directed under *Iron* (241).

Diluted standard iron solution: Immediately before use, dilute an accurately measured volume of the *Standard iron stock solution* quantitatively with water to obtain a solution containing the equivalent of 1 µg/mL of iron.

Sample solution: Shake the residue obtained from the test for *Residue on Ignition* with 50 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Standard solution: Transfer 10 mL of the *Diluted standard iron solution* to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard solution*, corresponding to a limit of 50 µg/g (ppm) of iron.

- **LIMIT OF SULFUR DIOXIDE, Method IV** (525): NMT 50 ppm
- **LIMIT OF PROPYLENE GLYCOL**

Internal standard solution: 0.5 mg/mL of 1,3-propanediol in anhydrous pyridine

Standard stock solution: 0.5 mg/mL of USP Propylene Glycol RS in *Internal standard solution*

Standard solution: Transfer 0.1 mL of the *Standard stock solution* to a 2-mL vessel with a screw cap fitted with a septum. Add 0.9 mL of anhydrous pyridine, 0.2 mL of hexamethyldisilazane, and 0.1 mL of trimethylchlorosilane. Close, and mix. Allow to stand for 15 min before injection.

Sample stock solution: Transfer 200 mg of Pregelatinized Hydroxypropyl Pea Starch to a 100-mL volumetric flask. Add 1.0 mL of the *Internal standard solution* and 9.0 mL of anhydrous pyridine. Boil under reflux using a water bath for 20 min. Allow to cool to room temperature.

Sample solution: Transfer 1.0 mL of the *Sample stock solution* to a 2-mL vessel with a screw cap fitted with a septum. Add 0.2 mL of hexamethyldisilazane and 0.1 mL of trimethylchlorosilane. Close, and mix. Allow to stand for 15 min before injection.

Chromatographic system

(See *Chromatography* (621), *System Suitability*).

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica capillary column; 0.25-µm layer of phase G1

Temperature

Detector: 250°

Injection port: 250°

Column: 70°. [NOTE—The column must be desorbed regularly. Conditions: Program from 70° to 300° at 7°/min, and maintain 10 min at 300°.]

Carrier gas: Helium

Flow rate: 3 mL/min

Injection type: Split ratio of 1:30

Injection size: 1 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for the trimethylsilylated derivative of propylene glycol and the trimethylsilylated derivative of 1,3-propanediol are 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the peaks due to the trimethylsilylated derivative of propylene glycol and the trimethylsilylated derivative of 1,3-propanediol

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the percentage of propylene glycol in the portion of Pregelatinized Hydroxypropyl Pea Starch taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = internal standard ratio (peak response of propylene glycol/peak response of 1,3-propanediol) from the *Sample solution*

R_S = internal standard ratio (peak response of propylene glycol/peak response of 1,3-propanediol) from the *Standard solution*

C_S = concentration of USP Propylene Glycol RS in the *Standard solution* (mg/mL)

C_U = concentration of Pregelatinized Hydroxypropyl Pea Starch in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.1%

- **LIMIT OF OXIDIZING SUBSTANCES**

Sample: 4.0 g

Analysis: Transfer the *Sample* to a glass-stoppered 125-mL conical flask, and add 50.0 mL of a mixture of water and methanol (1:1). Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine

color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate VS is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate VS is required (20 ppm, calculated as H₂O₂).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10³ cfu/g, the total combined molds and yeasts count does not exceed 10² cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*.
- **pH** (791)
Sample solution: Progressively suspend 3.0 g of Pregelatinized Hydroxypropyl Pea Starch in 100.0 mL of carbon dioxide-free water, stirring continuously. Determine the pH when all the solid is wetted.
Acceptance criteria: 4.5–8.0
- **LOSS ON DRYING** (731): Dry about 1 g at 130° for 90 min: it loses NMT 15.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)
USP Propylene Glycol RS

Potato Starch

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

DEFINITION

Potato Starch is obtained from the tuber of *Solanum tuberosum* L.

IDENTIFICATION

A. PROCEDURE

Analysis: Examine under a microscope using a mixture of equal volumes of glycerol and water.

Acceptance criteria: It presents granules, either irregularly shaped, ovoid or pear-shaped, usually 30–100 µm in size but occasionally exceeding 100 µm, or rounded, 10–35 µm in size. There are occasional compound granules having 2–4 components. The ovoid and pear-shaped granules have an eccentric hilum and the rounded granules acentric or slightly eccentric hilum. All granules show clearly visible concentric striations. Between orthogonally oriented polarizing plates or prisms, the granules show a distinct black cross intersecting at the hilum.

B. PROCEDURE

Sample solution: 20 mg/mL in water

Analysis: Boil for 1 min, and cool.

Acceptance criteria: A thick, opalescent mucilage is formed.

C. PROCEDURE

Sample solution: 1 mL of the mucilage obtained in Identification test B

Analysis: Add 0.05 mL of iodine and potassium iodide TS 2 to the *Sample solution*.

Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.6%, determined on a 1.0-g sample
- **LIMIT OF IRON**
Standard iron stock solution A: Equivalent of 10 µg/mL of iron prepared as directed under *Iron* (241)

Standard iron stock solution B: 1 µg/mL of iron from *Standard iron stock solution A* in water [NOTE—Prepare immediately before use.]

Standard iron solution: Transfer 10 mL of *Standard iron stock solution B* to a test tube, and add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

Sample solution: Shake 1.5 g of Potato Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, and add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard iron solution*, corresponding to a limit of 10 ppm of iron.

LIMIT OF SULFUR DIOXIDE

Carbon dioxide: Use carbon dioxide, with a flow regulator that will maintain a flow of 100 ± 5 mL/min.

Bromophenol blue indicator solution: 0.2 mg/mL of bromophenol blue in dilute alcohol. Filter if necessary.

Hydrogen peroxide solution: Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Just before use, add three drops of *Bromophenol blue indicator solution*, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

Apparatus: Figure 1

Figure 1

In this test, the sulfur dioxide is released from the sample in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500-mL three-neck, round-bottom boiling flask, A; a separatory funnel, B, having a capacity of 100 mL or greater; a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask; a reflux condenser, C, having a jacket length of 200 mm; and a delivery tube, E, connecting the upper end of the reflux condenser to the bottom of a receiving test tube, D. Apply a thin

film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

Sample: 25.0 g of Potato Starch

Analysis: Add 150 mL of water to the boiling flask.

Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of 100 ± 5 mL/min through the *Apparatus*. Start the condenser coolant flow. Add 10 mL of *Hydrogen peroxide solution* to a receiving test tube. After 15 min, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer the *Sample* into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 h. Remove the receiving test tube, and transfer its contents to a 200-mL wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 min, and allow to cool.

Add 0.1 mL of *Bromophenol blue indicator solution*, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)).

Calculate the content, in ppm, of sulfur dioxide in the *Sample* taken:

$$\text{Result} = 1000 \times 32.03 \times (\text{VN}/\text{W})$$

32.03 = milliequivalent weight of sulfur dioxide

V = volume of titrant consumed (mL)

N = normality of the titrant

W = weight of the *Sample* (g)

Acceptance criteria: NMT 50 ppm

• LIMIT OF OXIDIZING SUBSTANCES

Sample solution: Transfer 4.0 g to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS.

Analysis: Titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch–iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate is required (20 ppm, calculated as H_2O_2).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10^3 cfu/g; the total combined molds and yeasts count does not exceed 10^2 cfu/g; and it meets the requirements of the test for the absence of *Escherichia coli*.

• LOSS ON DRYING (731)

Sample: 1 g

Analysis: Dry the *Sample* at 130° for 90 min.

Acceptance criteria: NMT 20.0%

• pH (791)

Sample solution: Prepare a slurry by weighing 5.0 g of Potato Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water.

Analysis: Agitate continuously at a moderate rate for 1 min. Stop the agitation, and allow to stand for 15 min. Determine the pH to the nearest 0.1 unit.

Acceptance criteria: 5.0–8.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.♦

Hydroxypropyl Potato Starch

For the Amylose derivative, *m* is about 300–1000.

DEFINITION

Hydroxypropyl Potato Starch is partially substituted 2-hydroxypropylether obtained from potato starch by a chemical modification of etherification with propylene oxide. In addition, this starch may be partially hydrolyzed using acids or enzymes to obtain thinned starch. It contains NLT 2.0% and NMT 7.0% of hydroxypropyl groups, on the dried basis.

IDENTIFICATION

• A. PROCEDURE

Analysis: Examine under a microscope, using NLT 20× magnification and a mixture of glycerin and water (1:1) as a mounting agent.

Acceptance criteria: It presents granules, either irregularly shaped, ovoid or pear-shaped, usually 30–100 µm in size, but occasionally exceeding 100 µm, or rounded 10–35 µm in size. There are occasional compound granules having 2–4 components. The ovoid and pear-shaped granules have an eccentric hilum, and the rounded granules have a centric or slightly eccentric hilum. All granules show clearly visible concentric striations. Between crossed nicol prisms, the Hydroxypropyl Potato Starch granules show a distinct black cross intersecting at the hilum.

• B. PROCEDURE

Sample solution: Suspend 1 g of Hydroxypropyl Potato Starch in 50 mL of water, boil for 1 min, and cool.

Acceptance criteria: A translucent or clear mucilage is formed.

• C. PROCEDURE

Analysis: To 1 mL of the *Sample solution* obtained in *Identification test B* add 0.05 mL of iodine and potassium iodide TS 2.

Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

• D. PROCEDURE

Ninhydrin solution: Dissolve 3 g of ninhydrin in 100 mL of a 45.5-g/L solution of sodium metabisulfite.

Diluted sulfuric acid: 98 g/L of H₂SO₄

Sample: 100 mg of Hydroxypropyl Potato Starch

Analysis: Transfer the *Sample* to a 100-mL volumetric flask, and add 12.5 mL of *Diluted sulfuric acid*. Place the flask in a water bath, and heat until the *Sample* is dissolved. Cool, and dilute with water to 100 mL. [**CAUTION**—When sulfuric acid is miscible with water, it produces intense heat.]

Pipet 1 mL of this solution to a glass-stoppered, 25-mL graduated test-tube and, with the tube immersed in cold water, add drop-wise 8 mL of sulfuric acid. Mix well, and place the tube in a boiling water bath for exactly 3 min. Immediately transfer the tube to an ice bath until the solution is chilled. Add 0.6 mL of *Ninhydrin solution*, carefully allowing the reagent to run down the walls of the test tube. Immediately shake the tube well, and place it in a water bath at 25° for 100 min. Dilute with sulfuric acid to 25 mL [**CAUTION**—Use sulfuric acid cautiously.], and mix by inverting the tube several times. Do not shake.

Acceptance criteria: A violet color develops within 5 min due to the presence of hydroxypropyl groups (starch ether).

ASSAY

• PROCEDURE FOR HYDROXYPROPYL GROUPS

Deuterium chloride solution: Dilute 1 mL of deuterium chloride (38% w/w) with 5 mL of deuterium oxide.

Internal standard solution: Dissolve 50.0 mg of sodium 3-trimethylsilyl-1-propane sulfonate in about 5 g of deuterium oxide, weighed to the nearest 0.1 mg. Store in a sealed bottle.

Sample solution: Disperse 20 g of Hydroxypropyl Potato Starch in 200.0 mL of carbon dioxide-free water at room temperature. Agitate for 15 min, and filter. Repeat the operation two more times. If poor dispersibility or slow filtration is observed, use refrigerated carbon dioxide-free water for the washing operation. Dry the washed starch for NLT 4 h in vacuum at 30 ± 5°. Determine the moisture content (B) on 5 g of the washed and dried starch following the *Loss on Drying* test. Weigh 12.0 mg of the washed and dried starch in a 5-mm NMR tube. Add 0.75 mL of deuterium oxide and 0.1 mL of *Deuterium chloride solution*. Cap the tube, mix, and place it in a boiling water bath until a clear solution is obtained. [NOTE—It may take 3 min–1 h.] When a clear solution is obtained, allow to cool to room temperature. Dry the exterior of the tube, and weigh to the nearest 0.1 mg. Add 0.05 mL of *Internal standard solution*, and weigh to the nearest 0.1 mg. Determine the mass of the *Internal standard solution* added. Mix thoroughly.

Nuclear magnetic resonance spectrometry

(See *Nuclear Magnetic Resonance* <761>, *Quantitative Application*.)

Apparatus: FT-NMR spectrometer at minimum 300 MHz

Acquisition of ¹H NMR spectra: The following parameters may be used.

Sweep width: 8 ppm (about –1.0 to +7 ppm)

Irradiation frequency offset: None

Time domain: NLT 64 K

Pulse width: 90 degree

Pulse delay: 10 s

Dummy scans: 0

Number of scans: 8

Use the CH₃ signal of the internal standard for shift referencing. Set the shift of the peak of the singlet to 0 ppm. Record the FID signal.

Analysis

Samples: *Internal standard solution* and *Sample solution*
Call the integration sub-routine after phase corrections and baseline correction between –0.5 and +6 ppm. Measure the peak areas of the doublet from the methyl groups of the hydroxypropyl function at +1.2 ppm (A₂),

and of the methyl groups at 0 ppm of the internal standard (A₁) without ¹³C-satellites.

Measure the signal coming from the 3 protons of the methyl group in the hydroxypropyl function. Calculate the content of hydroxypropyl groups as a percentage (w/w, dried basis):

$$\text{Result} = \frac{(N \times A_2/A_1) \times (C_i \times W_i/W) \times (M_{r2}/M_{r1}) \times [100/(100 - B)]}{100}$$

- N = numerical value representing the 3 methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate), 3
- A₂ = area of the methyl groups of hydroxypropyl in Hydroxypropyl Potato Starch
- A₁ = area of the methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate)
- C_i = concentration of the internal standard in the *Internal standard solution* (mg/g)
- W_i = weight of the *Internal standard solution* in the NMR tube (g)
- W = weight of the washed and dried Hydroxypropyl Potato Starch in the NMR tube (mg)
- M_{r1} = molecular weight of the internal standard, 218.32 g/mol
- M_{r2} = molar mass of hydroxypropyl group, 59.09 g/mol
- B = moisture content of the washed and dried Hydroxypropyl Potato Starch used in the *Sample solution*, as a percentage (w/w)

Acceptance criteria: The content of hydroxypropyl groups is 2.0%–7.0% on the dried basis.

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION** <281>: NMT 0.6%, determined on a 1.0-g test specimen

• LIMIT OF IRON

Standard iron stock solution: Prepare a solution containing the equivalent of 10 µg/mL of iron, as directed under *Iron* <241>.

Diluted standard iron solution: Immediately before use, dilute an accurately measured volume of *Standard iron stock solution* quantitatively with water to obtain a solution containing the equivalent of 1 µg/mL of iron.

Standard solution: Transfer 10 mL of the *Diluted standard iron solution* to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Sample solution: Shake 1.0 g of Hydroxypropyl Potato Starch with 20 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard solution*, corresponding to a limit of 20 µg/g of iron.

• **LIMIT OF SULFUR DIOXIDE**, *Method IV* <525>: NMT 50 ppm

Organic Impurities

• PROCEDURE 1: LIMIT OF OXIDIZING SUBSTANCES

Sample: 4.0 g of Hydroxypropyl Potato Starch

Analysis: Transfer the *Sample* to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide.

Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate VS is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate VS is required (20 µg/g, calculated as H₂O₂).

• **PROCEDURE 2: FOREIGN MATTER**

Sample: 50 mg/mL of Hydroxypropyl Potato Starch in a mixture of glycerin and water (1:1)

Analysis: Examine under a microscope, using NLT 20× magnification and a mixture of glycerin and water (1:1) as a mounting agent.

Acceptance criteria: NMT traces of matter other than Hydroxypropyl Potato Starch granules are present.

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62):

The total aerobic microbial count does not exceed 10³ cfu/g, the total combined molds and yeasts count does not exceed 10² cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*.

• **pH** (791)

Sample solution: Suspend 5.0 g of Hydroxypropyl Potato Starch in 25.0 mL of carbon dioxide-free water, and shake for 60 s. Allow to stand for 15 min.

Acceptance criteria: 4.5–8.0

• **LOSS ON DRYING** (731): Dry about 1 g at 130° for 90 min: it loses NMT 20.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

Pregelatinized Hydroxypropyl Potato Starch

DEFINITION

Pregelatinized Hydroxypropyl Potato Starch is prepared from Hydroxypropyl Potato Starch by mechanical processing in the presence of water, with or without heat, to rupture all or some of the starch granules, and is subsequently dried. It contains NLT 2.0% and NMT 7.0% of hydroxypropyl groups on the dried basis.

IDENTIFICATION

• **A. TEST FOR PREGELATINIZED STATE**

Sample: 1 g

Analysis: Disperse the *Sample* in 50 mL of water at a temperature NMT 25°. Shake vigorously until lumps completely disperse/solubilize or until lumps disappear. Allow to stand for 20 min.

Acceptance criteria: A translucent or clear mucilage without precipitate is formed.

• **B. TEST FOR STARCH**

Analysis: Disperse 0.5 g in 2 mL of water without heating, and add 0.05 mL of iodine and potassium iodide TS₂.

Acceptance criteria: A reddish-violet or blue color is produced.

• **C. NINHYDRIN TEST**

Ninhydrin solution: Dissolve 3 g of ninhydrin in 100 mL of a 45.5-g/L solution of sodium metabisulfite.

Diluted sulfuric acid: 98 g/L of H₂SO₄

Sample: 100 mg

Analysis: Transfer the *Sample* to a 100-mL volumetric flask, and add 12.5 mL of *Diluted sulfuric acid*. Place the

flask in a water bath, and heat until the *Sample* is dissolved. Cool, and dilute with water to 100 mL. [**CAUTION**—When sulfuric acid is miscible with water, it produces intense heat.]

Pipet 1 mL of this solution to a glass-stoppered 25-mL graduated test tube and, with the tube immersed in cold water, add dropwise 8 mL of sulfuric acid. Mix well, and place the tube in a boiling water bath for exactly 3 min. Immediately transfer the tube to an ice bath until the solution is chilled. Add 0.6 mL of *Ninhydrin solution*, carefully allowing the reagent to run down the walls of the test tube. Immediately shake the tube well, and place it in a water bath at 25° for 100 min. Dilute with sulfuric acid to 25 mL. [**CAUTION**—Use sulfuric acid cautiously.] Mix by inverting the tube several times. Do not shake.

Acceptance criteria: A violet color develops within 5 min due to the presence of hydroxypropyl groups (starch ether).

ASSAY

• **ASSAY FOR HYDROXYPROPYL GROUPS**

Deuterium chloride solution: Dilute 1 mL of deuterium chloride (38% w/w) with 5 mL of deuterium oxide.

Internal standard solution: Disperse 50.0 mg of sodium 3-trimethylsilyl-1-propane sulfonate in about 5 g of deuterium oxide, weighed to the nearest 0.1 mg. Store in a sealed bottle.

Sample solution: Determine the moisture content (*B*) on 5 g of Pregelatinized Hydroxypropyl Potato Starch following the *Loss on Drying* test. Weigh 12.0 mg of the Pregelatinized Hydroxypropyl Potato Starch in a 5-mm NMR tube. Add 0.75 mL of deuterium oxide and 0.1 mL of *Deuterium chloride solution*. Cap the tube, mix, and place it in a boiling water bath until a clear solution is obtained. [NOTE—This may take from 3 min to 1 h.] When a clear solution is obtained, allow it to cool to room temperature. Dry the exterior of the tube, and weigh to the nearest 0.1 mg. Add 0.05 mL of the *Internal standard solution*. Weigh to the nearest 0.1 mg. Determine the mass of the *Internal standard solution* added. Mix thoroughly.

Instrumental conditions

(See *Nuclear Magnetic Resonance* (761), *Quantitative Applications*.)

Mode: Nuclear magnetic resonance spectrometry

Apparatus: FT-NMR spectrometer at minimum 300 MHz

Acquisition of ¹H NMR spectra: The following parameters may be used:

Sweep width: 8 ppm (about –1.0 to +7 ppm)

Irradiation frequency offset: None

Time domain: NLT 64 K

Pulse width: 90°

Pulse delay: 10 s

Dummy scans: 0

Number of scans: 8

Use the CH₃ signal of the internal standard for shift referencing. Set the shift of the peak of the singlet to 0 ppm. Record the FID signal.

Analysis

Samples: *Internal standard solution* and *Sample solution*
Call the integration subroutine after phase corrections and baseline correction between –0.5 and +6 ppm. Measure the peak areas of the doublet from the methyl groups of the hydroxypropyl function at +1.2 ppm (*A*₂), and of the methyl groups at 0 ppm of the internal standard (*A*₁) without ¹³C-satellites.

Measure the signal originating from the 3 protons of the methyl group in the hydroxypropyl function.

Calculate the content of hydroxypropyl groups as a percentage (w/w, dried basis):

$$\text{Result} = (N \times A_2/A_1) \times (C_1 \times W_1/W) \times (M_{12}/M_{11}) \times [100/(100 - B)] \times 100$$

- N = numerical value representing the 3 methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate), 3
- A_2 = area of the methyl groups of hydroxypropyl in Pregelatinized Hydroxypropyl Potato Starch
- A_1 = area of the methyl groups in the internal standard (sodium 3-trimethylsilyl-1-propane sulfonate)
- C_i = concentration of the internal standard in the *Internal standard solution* (mg/g)
- W_i = weight of the *Internal standard solution* in the NMR tube (g)
- W = weight of the Pregelatinized Hydroxypropyl Potato Starch in the NMR tube (mg)
- M_{r2} = molar mass of hydroxypropyl groups, 59.09 g/mol
- M_{r1} = molecular weight of the internal standard, 218.32 g/mol
- B = moisture content of the Pregelatinized Hydroxypropyl Potato Starch used in the *Sample solution*, as a percentage (w/w)
- Acceptance criteria:** 2.0%–7.0% of hydroxypropyl groups on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.6%, determined on a 1.0-g test specimen

- **LIMIT OF IRON**

Standard iron stock solution: Prepare a solution containing the equivalent of 10 µg/mL of iron, as directed under *Iron* (241).

Diluted standard iron solution: Immediately before use, dilute an accurately measured volume of the *Standard iron stock solution* quantitatively with water to obtain a solution containing the equivalent of 1 µg/mL of iron.

Sample solution: Shake the residue obtained from the test for *Residue on Ignition* with 20 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Standard solution: Transfer 10 mL of the *Diluted standard iron solution* to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard solution*, corresponding to a limit of 20 ppm of iron.

- **LIMIT OF SULFUR DIOXIDE**, *Method IV* (525): NMT 50 ppm

- **LIMIT OF PROPYLENE GLYCOL**

Internal standard solution: 0.5 mg/mL of 1,3-propanediol in anhydrous pyridine

Standard stock solution: 0.5 mg/mL of USP Propylene Glycol RS in *Internal standard solution*

Standard solution: Transfer 0.1 mL of the *Standard stock solution* to a 2-mL vessel with a screw cap fitted with a septum. Add 0.9 mL of anhydrous pyridine, 0.2 mL of hexamethyldisilazane, and 0.1 mL of trimethylchlorosilane. Close, and mix. Allow to stand for 15 min before injection.

Sample stock solution: Transfer 200 mg of Pregelatinized Hydroxypropyl Potato Starch to a 100-mL volumetric flask. Add 1.0 mL of the *Internal standard solution* and 9.0 mL of anhydrous pyridine. Boil under reflux using a water bath for 20 min. Allow to cool to room temperature.

Sample solution: Transfer 1.0 mL of the *Sample stock solution* to a 2-mL vessel with a screw cap fitted with a septum. Add 0.2 mL of hexamethyldisilazane and

0.1 mL of trimethylchlorosilane. Close, and mix. Allow to stand for 15 min before injection.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused-silica capillary column; 0.25-µm layer of phase G1

Temperature

Detector: 250°

Injection port: 250°

Column: 70°. [NOTE—The column must be desorbed regularly. Conditions: Program from 70° to 300° at 7°/min, and maintain 10 min at 300°.]

Carrier gas: Helium

Flow rate: 3 mL/min

Injection type: Split ratio of 1:30

Injection size: 1 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for the trimethylsilylated derivative of propylene glycol and the trimethylsilylated derivative of 1,3-propanediol are 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the peaks due to the trimethylsilylated derivative of propylene glycol and the trimethylsilylated derivative of 1,3-propanediol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of propylene glycol in the portion of Pregelatinized Hydroxypropyl Potato Starch taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = internal standard ratio (peak response of propylene glycol/peak response of 1,3-propanediol) from the *Sample solution*

R_S = internal standard ratio (peak response of propylene glycol/peak response of 1,3-propanediol) from the *Standard solution*

C_S = concentration of USP Propylene Glycol RS in the *Standard solution* (mg/mL)

C_U = concentration of Pregelatinized Hydroxypropyl Potato Starch in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.1%

- **LIMIT OF OXIDIZING SUBSTANCES**

Sample: 4.0 g

Analysis: Transfer the *Sample* to a glass-stoppered 125-mL conical flask, and add 50.0 mL of a mixture of water and methanol (1:1). Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate VS is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate VS is required (20 ppm, calculated as H₂O₂).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10³ cfu/g, the total combined molds and yeasts count does not exceed 10² cfu/g, and it meets the requirements of the test for the absence of *Escherichia coli*.

- **pH** <791>
Sample solution: Progressively suspend 3.0 g of Pregelatinized Hydroxypropyl Potato Starch in 100.0 mL of carbon dioxide-free water, stirring continuously. Determine the pH when all the solid is wetted.
Acceptance criteria: 4.5–8.0
- **LOSS ON DRYING** <731>: Dry about 1 g at 130° for 90 min; it loses NMT 20.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
- **USP REFERENCE STANDARDS** <11>
 USP Propylene Glycol RS

Pregelatinized Starch

DEFINITION

Pregelatinized Starch is Starch that has been chemically and/or mechanically processed to rupture all or part of the granules in the presence of water and subsequently dried. Some types of Pregelatinized Starch may be modified to render them compressible and flowable in character.

IDENTIFICATION

- A water slurry of it is colored orange-red to deep blue by iodine TS.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 0.5%, determined on a 2.0-g test specimen
- **IRON** <241>: NMT 20 ppm
Analysis: Dissolve the residue obtained in the test for *Residue on Ignition* in 8 mL of hydrochloric acid with the aid of gentle heating, and dilute with water to 100 mL. Dilute 25 mL of this solution with water to 47 mL.
- **LIMIT OF SULFUR DIOXIDE**
Sample solution: Mix 20 g with 200 mL of a 1-in-5 solution of anhydrous sodium sulfate, and filter.
Analysis: To 100 mL of the clear filtrate add 3 mL of starch TS, and titrate with 0.01 N iodine VS to the first permanent blue color.
Acceptance criteria: NMT 2.7 mL is consumed (80 ppm).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 1000 cfu/g; and the total combined molds and yeasts count does not exceed 100 cfu/g.
- **pH** <791>: 4.5–7.0
 Prepare a slurry by weighing 10.0 ± 0.1 g in 10 mL of alcohol and by diluting with water to 100 mL. Agitate continuously at a moderate rate for 5 min, then cease agitation and immediately potentiometrically determine the pH to the nearest 0.1 unit.
- **LOSS ON DRYING** <731>: Dry a sample at 120° for 4 h: it loses NMT 14.0% of its weight.
- **OXIDIZING SUBSTANCES**
Sample: 5 g
Analysis: To the *Sample* add 20 mL of a mixture of equal volumes of methanol and water, then add 1 mL of 6 N acetic acid, and stir until a homogeneous suspension is obtained. Add 0.5 mL of a freshly prepared, saturated solution of potassium iodide, and allow to stand for 5 min.
Acceptance criteria: No distinct blue, brown, or purple color is observed.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.
- **LABELING:** Label it to indicate the botanical source from which it was derived.

Pregelatinized Modified Starch

DEFINITION

Pregelatinized Modified Starch is Modified Starch that has been chemically or mechanically processed, or both, to rupture all or part of the granules to produce a product that swells in cold water.

IDENTIFICATION

- **A.**
Sample: 0.6 g
Analysis: Transfer the *Sample* to a 25-mL glass vial with a plastic cap. Add 9.4 g of water, cap, and shake vigorously to evenly disperse the starch. Add 10 g of 2% (w/w) NaOH solution, cap, and shake vigorously for 1 min to create a smooth mixture. Evaluate within 1 min.
Acceptance criteria: The final solution is translucent to opaque with a fluid consistency. A yellow tint of the final solution is acceptable.
- **B.** An aqueous dispersion of Pregelatinized Modified Starch is colored orange-red to deep blue by iodine TS.

IMPURITIES

- **RESIDUE ON IGNITION** <281>
Sample: 2.0 ± 0.1 g
Acceptance criteria: NMT 1.5%
- **LIMIT OF SULFUR DIOXIDE**
Sample solution: Mix 20.0 ± 0.1 g of Pregelatinized Modified Starch with 100 mL of 95% alcohol, and stir for several min to completely wet the starch.
Analysis: Slowly add 100 mL of water to the *Sample solution*, and stir until a smooth suspension is obtained. Allow the starch mixture to set undisturbed until most of the starch has settled, and filter the aqueous portion through paper (Whatman No. 1 or equivalent). To 100 mL of the clear filtrate add 100 mL of water. Add 3 mL of starch TS, and titrate with 0.01 N iodine VS to the first permanent blue or purple color.
Acceptance criteria: NMT 1.7 mL of 0.010 N iodine is consumed (NMT 0.005%).

SPECIFIC TESTS

- **pH** <791>
Sample: 10.0 ± 0.1 g
Analysis: Wet the *Sample* with 10 mL of alcohol, then dilute with water to 300 mL to obtain an aqueous dispersion. Stir continuously at a moderate rate for 5 min, and determine the pH to the nearest 0.1 unit.
Acceptance criteria: 3.0–9.0
- **LOSS ON DRYING** <731>
Analysis: Dry at 120° for 4 h.
Acceptance criteria: NMT 15%
- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count does not exceed 1 × 10³ cfu/g, and the total combined molds and yeasts count does not exceed 1 × 10² cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **IRON** <241>
Sample: The residue obtained in the test for *Residue on Ignition* <281>
Analysis: Dissolve the *Sample* in 8 mL of hydrochloric acid with the aid of gentle heating. Dilute with water to 100 mL in a volumetric flask. Dilute 25 mL of this solution with water to 47 ± 1 mL.

Acceptance criteria: NMT 20 µg/g

• **OXIDIZING SUBSTANCES**

Sample solution: To 5 g of Pregelatinized Modified Starch add 20 mL of a mixture of methanol and water (1:1).

Analysis: To the *Sample solution* add 1 mL of 6 N acetic acid, and stir until a homogeneous suspension is obtained. Add 0.5 mL of a freshly prepared saturated solution of potassium iodide, and allow to stand for 5 min.

Acceptance criteria: No distinct blue, brown, or purple color is observed.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

Rice Starch

Nonharmonized attributes: Characters, Microbial Enumeration Tests and Tests for Specified Microorganisms, Packaging and Storage

Specific local attributes: Foreign matter (EP)

Reagents and Reference materials: Each pharmacopeia will adapt the text to take account of local reference materials and reagent specifications.

DEFINITION

Rice Starch is obtained from the caryopsis of *Oryza sativa* L.

IDENTIFICATION

• **A. PROCEDURE**

Analysis: Examine under a microscope, using NLT 20x magnification and using a mixture of glycerin and water (1:1) as a mounting agent.

Acceptance criteria: It appears either as angular polyhedral granules of irregular sizes with diameters ranging from 2–23 µm, or as rounded or spheroidal granules of irregular sizes with diameters ranging from 25–35 µm. The central hilum consists of a distinct cavity or two- to five-rayed cleft, and there are no concentric striations. Between orthogonally oriented polarizing plates or prisms, the starch granules show a distinct black cross intersecting at the hilum.

• **B. PROCEDURE**

Sample solution: 20 mg/mL in water

Analysis: Boil for 1 min, and cool.

Acceptance criteria: A thin, cloudy mucilage is formed.

• **C. PROCEDURE**

Sample solution: 1 mL of the mucilage obtained in Identification test B

Analysis: Add 0.05 mL of iodine and potassium iodide TS 2 to the *Sample solution*.

Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION (281):** NMT 0.6%, determined on a 1.0-g sample

• **LIMIT OF IRON**

Standard iron stock solution A: Equivalent to 10 µg/mL of iron prepared as directed under *Iron* (241)

Standard iron stock solution B: 1 µg/mL of iron from *Standard iron stock solution A* in water

[NOTE—Prepare immediately before use.]

Standard iron solution: Transfer 10 mL of *Standard iron stock solution B* to a test tube, and add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

Sample solution: Shake 1.5 g of Rice Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, and add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard iron solution*, corresponding to a limit of 10 ppm of iron.

• **LIMIT OF SULFUR DIOXIDE**

Carbon dioxide: Use carbon dioxide, with a flow regulator that will maintain a flow of 100 ± 10 mL/min.

Bromophenol blue indicator solution: 0.2 mg/mL of bromophenol blue in dilute alcohol. Filter if necessary.

Hydrogen peroxide solution: Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Just before use, add 3 drops of *Bromophenol blue indicator solution*, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

Apparatus: Figure 1.

Figure 1

In this test, the sulfur dioxide is released from the sample in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500-mL three-neck, round-bottom boiling

flask, A; a separatory funnel, B, having a capacity of 100 mL or greater; a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask, a reflux condenser, C, having a jacket length of 200 mm, and a delivery tube, E, connecting the upper end of the reflux condenser to the bottom of a receiving test tube, D. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

Sample: 25.0 g of Rice Starch

Analysis: Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of 100 ± 5 mL/min through the *Apparatus*. Start the condenser coolant flow. Add 10 mL of *Hydrogen peroxide solution* to a receiving test tube. After 15 min, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer the *Sample* into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 h. Remove the receiving test tube, and transfer its contents to a 200-mL wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 min, and allow to cool.

Add 0.1 mL of *Bromophenol blue indicator solution*, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)).

Calculate the content, in ppm, of sulfur dioxide in the *Sample* taken:

$$\text{Result} = 1000 (32.03) \text{ VN/W}$$

32.03 = milliequivalent weight of sulfur dioxide

V = volume of titrant consumed (mL)

N = normality of the titrant

W = weight of the *Sample* (g)

Acceptance criteria: NMT 50 ppm

• LIMIT OF OXIDIZING SUBSTANCES

Sample solution: Transfer 4.0 g to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS.

Analysis: Titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch–iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate is required (20 ppm, calculated as H₂O₂).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 1000 cfu/g; the total combined molds and yeasts count does not exceed 100

cfu/g; and it meets the requirements of the test for the absence of *Escherichia coli*.♦

- **LOSS ON DRYING (731):** Dry 1 g at 130° for 90 min: it loses NMT 15.0% of its weight.

- **pH (791):** 5.0–8.0

Sample solution: Prepare a slurry by weighing 5.0 g of Rice Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water.

Analysis: Agitate continuously at a moderate rate for 1 min. Stop the agitation, and allow to stand for 15 min. Determine the pH to the nearest 0.1 unit.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.♦

Tapioca Starch

DEFINITION

Tapioca Starch consists of starch granules separated from the tubers of tapioca (cassava) [*Manihot utilissima* Pohl (Fam. Euphorbiaceae)].

IDENTIFICATION

• A.

Analysis: Examine Tapioca Starch under a microscope, using not less than 20× magnification and using glycerin as the mounting agent.

Acceptance criteria: It appears as spherical granules, each having one truncated side, typically having a 5- to 35-µm diameter, and having circular or several-rayed central clefts.

• B.

Sample suspension: 1 g of Tapioca Starch in 50 mL of water

Analysis: Boil the *Sample suspension* for 1 min, and cool.

Acceptance criteria: A thin, cloudy mucilage is formed.

• C.

Sample: The mucilage obtained in *Identification* test B

Analysis: To 1 mL of the *Sample* add 0.05 mL of iodine and potassium iodide TS 2.

Acceptance criteria: An orange-red to dark blue color is produced, which disappears on heating.

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 1.0 g

Acceptance criteria: NMT 0.6%

• IRON (241)

Test preparation: Shake 0.75 g of Tapioca Starch with 15 mL of 0.1 N hydrochloric acid, filter, and use 10 mL.

Acceptance criteria: NMT 20 µg/g

• LIMIT OF OXIDIZING SUBSTANCES

Sample: 4.0 g

Blank: 50 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.002 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Decant into a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS, and titrate with *Titrant* to the disappearance of the starch–iodide color.

Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate VS is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate VS is required (0.002%).

• **LIMIT OF SULFUR DIOXIDE**

Sample solution: Mix 20 g of Tapioca Starch with 200 mL of water until a smooth suspension is obtained, and filter.

Analysis: To 100 mL of the clear filtrate from the *Sample solution* add 3 mL of starch TS, and titrate with 0.01 N iodine solution VS to the first permanent blue color.

Acceptance criteria: NMT 1.7 mL of 0.01 N iodine solution VS is required (0.005%).

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined yeasts and molds count does not exceed 10^2 cfu/g. Tapioca Starch meets the requirements of the test for absence of *Escherichia coli*.

• **pH** (791)

Sample: 20.0 ± 0.1 g

Analysis: Transfer the *Sample* to a suitable nonmetallic container, and add 100 mL of water to obtain a slurry. Agitate continuously at a moderate rate for 5 min, then stop agitation, and immediately determine the pH.

Acceptance criteria: 4.5–7.0

• **LOSS ON DRYING** (731)

Analysis: Dry at 130° for 90 min.

Acceptance criteria: NMT 16.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.

Topical Starch—see *Topical Starch General Monographs*

Wheat Starch

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

DEFINITION

Wheat starch is obtained from the caryopsis of *Triticum aestivum* L. (*T. vulgare* Vill.).

IDENTIFICATION

• **A. PROCEDURE**

Analysis: Examine under a microscope using equal volumes of glycerol and water.

Acceptance criteria: It presents large and small granules, and, very rarely, intermediate sizes. The large granules, usually 10–60 µm in diameter, are discoid or, more rarely, reniform when seen face-on. The central hilum and striations are invisible or barely visible, and the granules sometimes show cracks on the edges. Seen in profile, the granules are elliptical and fusiform and the hilum appears as a slit along the main axis. The small granules, rounded or polyhedral, are 2–10 µm in diameter. Between orthogonally oriented polarizing plates or prisms, the granules show a distinct black cross intersecting at the hilum.

• **B. PROCEDURE**

Sample solution: 20 mg/mL in water

Analysis: Boil for 1 min, and cool.

Acceptance criteria: A thin, cloudy mucilage is formed.

• **C. PROCEDURE**

Sample solution: 1 mL of the mucilage obtained in *Identification test B*

Analysis: Add 0.05 mL of iodine and potassium iodide TS 2 to the *Sample solution*.

Acceptance criteria: An orange-red to dark blue color is produced, which disappears upon heating.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.6%, determined on a 1.0-g sample

• **LIMIT OF IRON**

Standard iron stock solution A: Equivalent to 10 µg/mL of iron prepared as directed under *Iron* (241)

Standard iron stock solution B: 1 µg/mL of iron from *Standard iron stock solution A* in water [NOTE—Prepare immediately before use.]

Standard iron solution: Transfer 10 mL of *Standard iron stock solution B* to a test tube, and add 2 mL of citric acid solution (2 in 10), and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

Sample solution: Shake 1.5 g of Wheat Starch with 15 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube, and add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, and dilute with water to 20 mL.

Acceptance criteria: After 5 min, any pink color in the *Sample solution* is not more intense than that in the *Standard iron solution*, corresponding to a limit of 10 ppm of iron.

• **LIMIT OF SULFUR DIOXIDE**

Carbon dioxide: Use carbon dioxide, with a flow regulator that will maintain a flow of 100 ± 5 mL/min.

Bromophenol blue indicator solution: 0.2 mg/mL of bromophenol blue in dilute alcohol. Filter if necessary.

Hydrogen peroxide solution: Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Just before use, add 3 drops of *Bromophenol blue indicator solution*, and neutralize to a violet-blue endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

Apparatus: *Figure 1*

In this test, the sulfur dioxide is released from the sample in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. The apparatus consists essentially of a 500-mL three-neck, round-bottom boiling flask, A; a separatory funnel, B, having a capacity of 100 mL or greater; a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask; a reflux condenser, C, having a jacket length of 200 mm; and a delivery tube, E, connecting the upper end of the reflux condenser to the bottom of a receiving test tube, D. Apply a thin film of stopcock grease to the sealing surfaces of all of the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

Sample: 25.0 g of Wheat Starch

Figure 1

Analysis: Add 150 mL of water to the boiling flask. Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of 100 ± 5 mL/min through the Apparatus. Start the condenser coolant flow. Add 10 mL of *Hydrogen peroxide solution* to a receiving test tube. After 15 min, without interrupting the flow of carbon dioxide, remove the separatory funnel from the boiling flask, and transfer the *Sample* into the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 h. Remove the receiving test tube, and transfer its contents to a 200-mL wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 min, and allow to cool. Add 0.1 mL of *Bromophenol blue indicator solution*, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Calculate the content, in ppm, of sulfur dioxide in the *Sample* taken:

$$\text{Result} = 1000 \times 32.03 \times (VN/W)$$

32.03 = milliequivalent weight of sulfur dioxide

V = volume of titrant consumed (mL)

N = normality of the titrant

W = weight of the *Sample* (g)

Acceptance criteria: NMT 50 ppm

• LIMIT OF OXIDIZING SUBSTANCES

Sample solution: Transfer 4.0 g to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 min. Transfer to a glass-stoppered, 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered, 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5–1.0 g of potassium iodide.

Insert the stopper, swirl, and allow to stand for 25–30 min in the dark. Add 1 mL of starch TS.

Analysis: Titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch–iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide.

Acceptance criteria: NMT 1.4 mL of 0.002 N sodium thiosulfate is required (20 ppm, calculated as H_2O_2).

SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10^3 cfu/g; the total combined molds and yeasts count does not exceed 10^2 cfu/g; and it meets the requirements of the test for the absence of *Escherichia coli*.

• LOSS ON DRYING (731)

Sample: 1 g

Analysis: Dry the *Sample* at 130° for 90 min.

Acceptance criteria: NMT 15.0%

• pH (791)

Sample solution: Prepare a slurry by weighing 5.0 g of Wheat Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water.

Analysis: Agitate continuously at a moderate rate for 1 min. Stop the agitation, and allow to stand for 15 min. Determine the pH to the nearest 0.1 unit.

Acceptance criteria: 4.5–7.0

• TOTAL PROTEIN

Analysis: Weigh 6.0 g of sample containing 2 mg of nitrogen; transfer to a combustion flask; add 4 g of a powdered mixture consisting of 100 g of potassium sulfate, 5 g of cupric sulfate, and 2.5 g of selenium; and add three glass beads. Wash any adhering particles from the neck into the flask with 5 mL of sulfuric acid, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulfuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulfuric acid in the neck of the flask; precautions should be taken to prevent the upper part of the flask from becoming overheated. Continue the heating for 30 min, unless otherwise prescribed. Cool, dissolve the solid material by cautiously adding to the mixture 25 mL of water, cool again, and place in a steam distillation apparatus. Add 30 mL of sodium hydroxide solution (42 in 100), and distill immediately by passing steam through the mixture. Collect 40 mL of distillate in 20.0 mL of 0.01 N hydrochloric acid and enough water to cover the tip of the condenser. Toward the end of the distillation, lower the receiver so that the tip of the condenser is above the surface of the acid. Take precautions to prevent any water on the outer surface of the condenser from reaching the contents of the receiver. Titrate the distillate with 0.01 N sodium hydroxide, using methyl purple TS as the indicator (n_1 mL of 0.01 N sodium hydroxide).

Repeat the test using 50 mg of glucose in place of the substance to be examined (n_2 mL of 0.01 N sodium hydroxide).

$$\text{Content of nitrogen} = [0.01401 \times (n_2 - n_1)]/m$$

m = amount of test substance weighed (g)

Acceptance criteria: NMT 0.3% (corresponding to 0.048% N_2 , conversion factor: 6.25)

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. No storage requirements specified.♦

Stearic Acid

Portions of this monograph that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

Octadecanoic acid;
Stearic acid [57-11-4].

DEFINITION

Mixture consisting of stearic (octadecanoic) acid ($C_{18}H_{36}O_2$; M_r 284.5) and palmitic (hexadecanoic) acid ($C_{16}H_{32}O_2$; M_r 256.4) obtained from fats or oils of vegetable or animal origin.

Content:

Stearic acid 50	Stearic acid: 40.0%–60.0%. Sum of the contents of stearic acid and palmitic acids: NLT 90.0%.
Stearic acid 70	Stearic acid: 60.0%–80.0%. Sum of the contents of stearic and palmitic acids: NLT 90.0%.
Stearic acid 95	Stearic acid: NLT 90.0%. Sum of the contents of stearic acid and palmitic acids: NLT 96.0%.

[NOTE—Stearic Acid labeled solely for external use is exempt from the requirement that it be prepared from edible sources.]

IDENTIFICATION

- **A.** It meets the requirements of the test for *Freezing Point*.
- **B. ACID VALUE**

Light petroleum: Use a sample that has the following properties: a clear, colorless, liquid without fluorescence; practically insoluble in water; miscible with alcohol; density at 20° about 0.720; distillation range 100°–120°; water content NMT 0.03%.¹

Sample solution: Dissolve 0.5 g of Stearic Acid in 50 mL of a mixture of equal volumes of alcohol and *Light petroleum* previously neutralized with 0.1 N potassium hydroxide or 0.1 N sodium hydroxide, using 0.5 mL of phenolphthalein TS as indicator. If necessary, heat to about 90° to dissolve the substance to be examined.

Analysis: Titrate the *Sample solution* with 0.1 N potassium hydroxide or 0.1 N sodium hydroxide until the pink color persists for at least 15 s. When heating has been applied to aid dissolution, maintain the temperature at about 90° during the titration.

Calculate the acid value of the portion of Stearic Acid taken:

$$\text{Result} = I_A = n/m \times N \times 56.10$$

n = amount of titrant used (mL)

m = amount of Stearic Acid taken to prepare the *Sample solution* (g)

N = normality of the potassium hydroxide solution

56.10 = formula weight of potassium hydroxide

Acceptance criteria: 194–212

- **C.** The retention times of the major peaks from the *Sample solution* correspond to those from the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Boron trifluoride–methanol solution: 140 g/L of boron trifluoride in methanol

¹ Petroleum ether; boiling range 100°–140°; CAS 64742-49-0 from Fisher Scientific; catalog number AC23302-0025 is suitable.

Standard solution: Prepare as directed in the *Sample solution* using 50 mg of USP Stearic Acid RS and 50 mg of USP Palmitic Acid RS.

Sample solution: Dissolve 100 mg of Stearic Acid in a small conical flask fitted with a suitable reflux attachment with 5 mL of *Boron trifluoride–methanol solution*. Boil under reflux for 10 min. Add 4.0 mL of heptane through the condenser, and boil again under reflux for 10 min. Allow to cool. Add 20 mL of a saturated solution of sodium chloride. Shake, and allow the layers to separate. Remove about 2 mL of the organic layer, and dry it over 0.2 g of anhydrous sodium sulfate. Dilute 1.0 mL of this solution with heptane to 10.0 mL.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 30-m × 0.32-mm fused silica coated with a 0.5-μm layer of stationary phase G16

Temperature

Injector: 220°

Detector: 260°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	2
70	5	240	5

Carrier gas: Helium, passed through a bed of molecular sieve for drying, if necessary

Flow rate: 2.4 mL/min

Injection size: 1 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between the methyl palmitate and methyl stearate peaks determined on 6 injections

Relative standard deviation: NMT 3.0% for the methyl stearate and methyl palmitate peaks (from 6 replicate injections of *Sample solution*); NMT 1.0% for the ratio of the peak areas of methyl palmitate to the peak areas of methyl stearate, from 6 replicate injections

Analysis: Calculate the percentage of stearic acid ($C_{18}H_{36}O_2$) in the portion of sample taken:

$$\text{Result} = (A_S/A_T) \times 100$$

A_S = peak area due to methyl stearate

A_T = sum of the peak areas of all the fatty acid esters in the chromatogram

Similarly, calculate the percentage of palmitic acid ($C_{16}H_{32}O_2$) in the portion of sample taken:

$$\text{Result} = (A_P/A_T) \times 100$$

A_P = peak area due to methyl palmitate

A_T = sum of the peak areas of all the fatty acid esters in the chromatogram

Acceptance criteria

For Stearic acid 50: 40.0–60.0% of $C_{18}H_{36}O_2$, and the sum of the stearic acid and palmitic acid is NLT 90.0%.

For Stearic acid 70: 60.0–80.0% of $C_{18}H_{36}O_2$, and the sum of the stearic acid and palmitic acid is NLT 90.0%.

For Stearic acid 95: NLT 90.0% of $C_{18}H_{36}O_2$, and the sum of the stearic acid and palmitic acid is NLT 96.0%.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 4 mg, determined on a 4-g portion (0.1%).
- **HEAVY METALS, Method II** (231): NMT 10 ppm.

SPECIFIC TESTS

- **FATS AND FIXED OILS, Iodine Value** (401)

Sample: 1 g

Analysis: Proceed as directed in *Method I*, except use 15 mL of chloroform.

Acceptance criteria: See *Table 2*.

Table 2

Type	Iodine Value
Stearic acid 50	NMT 4.0
Stearic acid 70	NMT 4.0
Stearic acid 95	NMT 1.5

- **COLOR OF SOLUTION**

Standard stock solution Y (yellow): 2.4 mL of ferric chloride CS, 0.6 mL of cobaltous chloride CS, and 7.0 mL of hydrochloric acid solution (10 g/L)

Standard stock solution BY (brownish-yellow): 2.4 mL of ferric chloride CS, 1.0 mL of cobaltous chloride CS, 0.4 mL of cupric sulfate CS, and 6.2 mL of hydrochloric acid solution (10 g/L)

Standard solution Y: 2.5 mL of *Standard stock solution Y* and 97.5 mL of hydrochloric acid solution (10 g/L)

Standard solution BY: 2.5 mL of *Standard stock solution BY* and 97.5 mL of hydrochloric acid solution (10 g/L)

Analysis: Heat Stearic Acid to 75°.

Acceptance criteria: The resulting liquid is not more intensely colored than *Standard solution Y* or *Standard solution BY*.

Change to read:

- **ACIDITY**

Analysis: Melt 5.0 g of Stearic Acid, shake for 2 min with 10 mL of hot carbon dioxide-free water, cool slowly, and filter. To the filtrate add 0.05 mL (ERR 1-May-2012) of methyl orange TS.

Acceptance criteria: No red color develops.

- **FREEZING POINT**

Apparatus: Consists of a test tube about 25 mm in diameter and 150 mm long placed inside a test tube about 40 mm in diameter and 160 mm long. The inner tube is closed by a stopper which carries a thermometer about 175 mm long and graduated in 0.2°, fixed so that the bulb is about 15 mm above the bottom of the tube. The stopper has a hole allowing the passage of the stem of a stirrer made from a glass rod or other suitable material formed at one end into a loop of about 18 mm overall diameter at right angles to the rod. The inner tube with its jacket is supported centrally in a 1-L beaker containing a suitable cooling liquid to within 20-mm of the top. A thermometer is supported in the cooling bath. Place in the inner tube sufficient quantity of the liquid or previously melted substance to be examined, to cover the thermometer bulb, and determine the approximate freezing point by cooling rapidly.

Analysis: Place the inner tube in a bath about 5° above the approximate freezing point until all but the last traces of crystals are melted. Fill the beaker with water or a saturated solution of sodium chloride; at a temperature about 5° lower than the expected freezing point, insert the inner tube into the outer tube, ensuring that some seed crystals are present, and stir thoroughly until solidification takes place. Note the highest temperature observed during solidification.

Acceptance criteria: See *Table 3*.

Table 3

Type	Freezing Point (°)
Stearic acid 50	53–59
Stearic acid 70	57–64
Stearic acid 95	64–69

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** If it is for external use only, the labeling so indicates. The label states the type of stearic acid (50, 70, or 95).
- **USP REFERENCE STANDARDS** (11)
USP Palmitic Acid RS
USP Stearic Acid RS

Purified Stearic Acid**DEFINITION**

Purified Stearic Acid is manufactured from fats and oils derived from edible sources and is a mixture of stearic acid (C₁₈H₃₆O₂) and palmitic acid (C₁₆H₃₂O₂), which together constitute NLT 96.0% of the total content. The content of C₁₈H₃₆O₂ is NLT 90.0% of the total.

[NOTE—Purified Stearic Acid labeled solely for external use is exempt from the requirement that it be prepared from edible sources.]

ASSAY

- **PROCEDURE**

Standard solution: Transfer 50 mg of USP Stearic Acid RS and 50 mg of USP Palmitic Acid RS into a small conical flask fitted with a suitable reflux attachment. Add 5.0 mL of a solution prepared by dissolving 14 g of boron trifluoride in methanol to make 100 mL; swirl and reflux for 15 min or until the solid is dissolved. Cool, transfer the reaction mixture with the aid of 10 mL of chromatographic solvent hexane to a 60-mL separator, and add 10 mL of water and 10 mL of saturated sodium chloride solution. Shake, allow to separate, then drain and discard the lower, aqueous layer. Pass the hexane layer through 6 g of anhydrous sodium sulfate (previously washed with chromatographic solvent hexane) into a suitable flask.

Sample solution: Transfer 100 mg of Purified Stearic Acid into a small conical flask fitted with a suitable reflux attachment. Add 5.0 mL of a solution prepared by dissolving 14 g of boron trifluoride in methanol to make 100 mL; swirl and reflux for 15 min or until the solid is dissolved. Cool, transfer the reaction mixture with the aid of 10 mL of chromatographic solvent hexane to a 60-mL separator, and add 10 mL of water and 10 mL of saturated sodium chloride solution. Shake, allow to separate, then drain and discard the lower, aqueous layer. Pass the hexane layer through 6 g of anhydrous sodium sulfate (previously washed with chromatographic solvent hexane) into a suitable flask.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 1.5-m × 3-mm, preferably glass; packing of 15% G4 on S1A

Carrier gas: Helium, passed through a bed of molecular sieve for drying, if necessary

Injection volume: 1–2 μ L

Temperatures

Injection port: 210°

Detector: 210°

Column: 165°

System suitability

Samples: *Standard solution* and *Sample solution*

Suitability requirements

Resolution: NLT 2.0 between methyl palmitate and methyl stearate, *Sample solution*

[NOTE—Locate the peaks by comparison with the chromatogram from the *Standard solution*.]

Relative standard deviation: NMT 1.5% for methyl stearate and methyl palmitate for five replicate injections of the *Sample solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of stearic acid ($C_{18}H_{36}O_2$) in the portion of Purified Stearic Acid taken:

$$\text{Result} = (A/B) \times 100$$

A = peak area due to methyl stearate

B = sum of all the fatty acid ester peaks

Calculate the percentage of palmitic acid ($C_{16}H_{32}O_2$) in the portion of Purified Stearic Acid taken:

$$\text{Result} = (A/B) \times 100$$

A = peak area due to methyl palmitate

B = sum of all the fatty acid ester peaks

Acceptance criteria

Stearic acid: NLT 90.0%

Sum of stearic acid and palmitic acid: NLT 96.0%

IMPURITIES

• RESIDUE ON IGNITION (281)

Sample: 4 g

Acceptance criteria: NMT 4 mg (0.1%)

• HEAVY METALS, Method II (231): NMT 10 μ g/g

SPECIFIC TESTS

• CONGEALING TEMPERATURE (651): 66°–69°

• FATS AND FIXED OILS, Acid Value (401)

Sample: 1 g

Acceptance criteria: 195–200

• FATS AND FIXED OILS, Iodine Value (401)

Analysis: Proceed as directed in *Method I*, except use 35 mL of chloroform.

Acceptance criteria: NMT 1.5

• MINERAL ACID

Sample: 5 g of melted Purified Stearic Acid

Analysis: Shake the *Sample* with an equal volume of hot water for 2 min, cool, and filter.

Acceptance criteria: The filtrate is not reddened by the addition of 1 drop of methyl orange TS.

• NEUTRAL FAT OR PARAFFIN

Sample solution: 1 g of Stearic Acid in 30 mL of anhydrous sodium carbonate solution (16.7 mg/mL)

Analysis: Boil the *Sample solution*.

Acceptance criteria: The resulting solution, while hot, shows NMT a faint opalescence.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in well-closed containers.

• LABELING: If it is for external use only, the labeling so indicates.

• USP REFERENCE STANDARDS (11)

USP Palmitic Acid RS

USP Stearic Acid RS

Stearoyl Polyoxylglycerides

DEFINITION

Stearoyl Polyoxylglycerides is a mixture of monoesters, diesters, and triesters of glycerol and monoesters and diesters of polyethylene glycols. The polyethylene glycols used have a mean molecular weight between 300 and 4000. It is produced by partial alcoholysis of saturated oils, mainly containing triglycerides of stearic acid, with polyethylene glycol, by esterification of glycerol and polyethylene glycol with fatty acids, or as a mixture of glycerol esters and ethylene oxide condensate with the fatty acids of the hydrogenated oils. The hydroxyl value is NLT 85% and NMT 115% of the labeled nominal value, and the saponification value is NLT 90% and NMT 110% of the labeled nominal value. Stearoyl Polyoxylglycerides may contain free polyethylene glycols.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: 50 mg/mL of USP Stearoyl Polyoxylglycerides in methylene chloride

Sample solution: 50 mg/mL of Stearoyl Polyoxylglycerides in methylene chloride

Chromatographic system

Application volume: 10 μ L

Developing solvent system: Ether and hexanes (70:30)

Spray reagent: 0.1 mg/mL of rhodamine B in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Then spray the plate with *Spray reagent*, and locate the spots on the plate by examination under UV light at a wavelength of 365 nm.

Acceptance criteria: The R_f values of the principal spots from the *Sample solution* correspond to those from the *Standard solution*.

• C. It meets the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* (401).

IMPURITIES

• HEAVY METALS, Method II (231): NMT 10 μ g/g

• ARTICLES OF BOTANICAL ORIGIN, Total Ash (561): NMT 0.2%

• ALKALINE IMPURITIES

Sample: 5.0 g

Analysis: Heat the *Sample* slightly until the test substance melts, add 10 mL of alcohol and 0.05 mL of bromophenol blue TS, and mix well. While the solution is still warm, titrate with 0.01 N hydrochloric acid VS to change the color to yellow.

Acceptance criteria: NMT 1.0 mL of 0.01 N hydrochloric acid VS is required.

• LIMIT OF FREE ETHYLENE OXIDE AND DIOXANE

[CAUTION—Ethylene oxide is toxic and flammable. Prepare all solutions in a well-ventilated hood. The operator must protect hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between 4° and 8°.]

Magnesium chloride solution: 500 mg/mL of magnesium chloride in alcohol

Ethylene oxide stock solution: Into a dry, clean test tube, cooled in a mixture of sodium chloride and crushed ice (1:3), introduce a slow current of ethylene oxide gas, allowing condensation onto the inner wall of the test tube. Using a glass syringe, previously cooled to –10°, transfer 300 μ L of liquid ethylene oxide, equivalent to 0.25 g, to 50 mL of polyethylene glycol 200. Determine the absorbed quantity of ethylene oxide by

weighing before and after absorption. Dilute with polyethylene glycol 200 to 100.0 mL.

Standardize this solution by transferring 10.0 mL of *Magnesium chloride solution* and 20.0 mL of 0.1 M alcoholic hydrochloric acid VS to a volumetric flask. Insert the stopper, shake to obtain a saturated solution, and allow to equilibrate overnight. Transfer 5.00 mL of *Ethylene oxide stock solution* to the flask, and allow to stand for 30 min. Titrate with 0.1 M alcoholic potassium hydroxide VS. Perform a blank titration, using the same quantity of polyethylene glycol 200 instead of *Ethylene oxide stock solution*, and note the difference in volumes required. Each mL of the difference in volumes of 0.1 M alcoholic potassium hydroxide VS consumed is equivalent to 4.404 mg of ethylene oxide. Calculate the concentration of ethylene oxide, in mg/g, in the *Ethylene oxide stock solution*.

Ethylene oxide solution: Prepare immediately before use. Dilute a volume of *Ethylene oxide stock solution* with polyethylene glycol 200 to obtain a solution containing 50 µg of ethylene oxide per g. Dilute 1.0 mL of this solution with water to 5.0 mL to obtain a solution having a concentration of 10 µg/mL of ethylene oxide.

Dioxane solution: 0.5 mg/mL of dioxane

Standard solution A: Transfer 1.0 g of Stearoyl Polyoxylglycerides to a 10-mL vial, and add 1.0 mL of *N,N*-dimethylacetamide, 0.1 mL of *Ethylene oxide solution*, and 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogenous solution. Allow to stand at 90° for 45 min.

Standard solution B: Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL vial, add 0.1 mL of a freshly prepared solution of acetaldehyde, containing 10 mg/L of acetaldehyde, and add 0.1 mL of *Dioxane solution*. Close the vial, and mix to obtain a homogenous solution.

Sample solution: Transfer 1.0 g of Stearoyl Polyoxylglycerides to a 10-mL vial, and add 1.0 mL of *N,N*-dimethylacetamide and 0.2 mL of water. Close the vial, and mix to obtain a homogenous solution. Allow to stand at 90° for 45 min.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

[NOTE—Headspace apparatus that automatically transfers a measured amount of headspace may be used.]

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m glass or quartz capillary column bonded with a 1.0-µm layer of phase G1

Temperatures

Injection port: 150°

Detector: 250°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	—	50	5
50	5	180	—
180	30	230	5

Carrier gas: Helium

Flow rate: 1 mL/min

Injection volume: 1 mL

System suitability

Sample: Gaseous phase of *Standard solution B*

[NOTE—The relative retention times for acetaldehyde and ethylene oxide are 0.94 and 1.0, respectively.]

Suitability requirements

[NOTE—Record the peak responses as directed for *Analysis*, adjusting the sensitivity of the system so that the peak heights of the two principal peaks are NLT 15% of the full scale of the recorder.]

Resolution: NLT 2.0 between acetaldehyde and ethylene oxide

Relative standard deviation: NMT 15.0%

Analysis

Samples: *Standard solution A* and *Sample solution*
Perform all determinations three times. Using a heated, gas-tight gas chromatographic syringe, separately inject the gaseous headspace of *Standard solution A* and of the *Sample solution*.

Calculate the concentration of ethylene oxide in the sample taken:

$$\text{Result} = C \times \{r_U / [(r_S \times C_U) - (r_U \times C_S)]\}$$

C = concentration of ethylene oxide in *Standard solution A* (µg/mL)

r_U = peak response of ethylene oxide from the *Sample solution*

r_S = peak response of ethylene oxide from *Standard solution A*

C_U = concentration of Stearoyl Polyoxylglycerides in *Sample solution* (g/mL)

C_S = concentration of stearyl polyoxylglycerides in *Standard solution A* (g/mL)

Calculate the concentration of dioxane in the sample taken:

$$\text{Result} = C_D \times (d_U/5) \times [(d_S \times C_U) - (d_U \times C_S)]$$

C_D = concentration of dioxane in *Standard solution A* (µg/mL)

d_U = peak response of dioxane from the *Sample solution*

d_S = peak response of dioxane from *Standard solution A*

C_U = concentration of Stearoyl Polyoxylglycerides in *Sample solution* (g/mL)

C_S = concentration of stearyl polyoxylglycerides in *Standard solution A* (g/mL)

Acceptance criteria

Ethylene oxide: NMT 1 µg/g

Dioxane: NMT 10 µg/g

• LIMIT OF FREE GLYCEROL

Sample: 1.20 g

Periodic acetic acid solution: Dissolve 0.446 g of sodium periodate in 2.5 mL of a 25% (v/v) solution of sulfuric acid, diluting to 100.0 mL with glacial acetic acid.

Potassium iodide solution: 75 mg/mL of potassium iodide

Analysis: Dissolve the *Sample* in 25 mL of methylene chloride, heating if necessary. Cool, and add 100 mL of water and 25.0 mL of *Periodic acetic acid solution*. Shake, and allow to stand for 30 min. Add 40 mL of *Potassium iodide solution*, and allow to stand for 1 min. Add 1 mL of starch TS, and titrate the liberated iodine with 0.1 M sodium thiosulfate VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* <541>). Calculate the percentage of glycerol in the sample taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 23.0 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: NMT 5.0%

SPECIFIC TESTS

• FATS AND FIXED OILS, *Acid Value* <401>

Sample: 2.0 g

Acceptance criteria: NMT 2.0

• FATS AND FIXED OILS, *Fatty Acid Composition* <401>:

Stearoyl Polyoxylglycerides exhibits the following

composition profile of fatty acids, as determined in the chapter (see Table 2).

Table 2

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
12	0	≤5.0
14	0	≤5.0
16	0	40.0–50.0
18	0	48.0–58.0

- **FATS AND FIXED OILS, Hydroxyl Value <401>**
Sample: 1.0 g
Acceptance criteria: 25–56, 85%–115% of the labeled nominal value
- **FATS AND FIXED OILS, Iodine Value <401>**: NMT 2.0
- **FATS AND FIXED OILS, Peroxide Value <401>**
Sample: 2.0 g
Acceptance criteria: NMT 6.0
- **FATS AND FIXED OILS, Saponification Value <401>**
Sample: 2.0 g
Acceptance criteria: 67–112, 90%–110% of the labeled nominal value
- **WATER DETERMINATION, Method I <921>**
Sample: 1.0 g
Solvent: Anhydrous pyridine or a mixture of methylene chloride and anhydrous methanol (70:30)
Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light and moisture. Store at controlled room temperature.
- **LABELING:** Label it to indicate the type and the average nominal molecular weight of polyethylene glycols used as part of the official title. The label also indicates the hydroxyl value and the saponification value.
- **USP REFERENCE STANDARDS <11>**
USP Stearoyl Polyoxylglycerides RS

Stearyl Alcohol

1-Octadecanol;
Octadecan-1-ol [112-92-5].

DEFINITION

Stearyl Alcohol contains NLT 90.0% of stearyl alcohol ($\text{C}_{18}\text{H}_{38}\text{O}$), the remainder consisting chiefly of related alcohols.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *System suitability solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

System suitability solution: 9 mg/mL of USP Stearyl Alcohol RS and 1 mg/mL of USP Cetyl Alcohol RS in dehydrated alcohol

Sample solution: 10 mg/mL of Stearyl Alcohol in dehydrated alcohol

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 3-mm × 2-m; packed with 10% liquid phase G2 on support S1A

Carrier gas: Helium

Temperatures

Injection port: 275°

Detector: 250°

Column: 205°

Injection volume: 2 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 4.0 between the cetyl alcohol and stearyl alcohol peaks

Relative standard deviation: NMT 1.5% for the area ratio of stearyl alcohol to cetyl alcohol

Analysis

Sample: *Sample solution*

Calculate the percentage of stearyl alcohol ($\text{C}_{18}\text{H}_{38}\text{O}$) in the portion of Stearyl Alcohol taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area for stearyl alcohol from the *Sample solution*

r_T = sum of the areas of all the peaks except the solvent peak from the *Sample solution*

Acceptance criteria: NLT 90.0%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE <741>**: 55°–60°

- **FATS AND FIXED OILS, Acid Value (Free Fatty Acids) <401>**: NMT 2

- **FATS AND FIXED OILS, Hydroxyl Value <401>**

Sample solution: Add 2 g of Stearyl Alcohol in a dry, glass-stoppered, 250-mL flask, and add 2 mL of pyridine followed by 10 mL of toluene.

Analysis: To the *Sample solution* add 10.0 mL of a solution of acetyl chloride, prepared by mixing 10 mL of acetyl chloride with 90 mL of toluene. Insert the stopper in the flask, and immerse in a water bath heated at 60°–65° for 20 min. Add 25 mL of water, insert the stopper in the flask, and shake vigorously for several min to decompose the excess acetyl chloride. Add 0.5 mL of phenolphthalein TS, and titrate to a permanent pink endpoint with 1 N sodium hydroxide VS, shaking the flask vigorously toward the end of the titration to maintain the contents in an emulsified condition. Perform a blank test with the same quantities of the same reagents and in the same manner.

$$\text{Result} = [(V_S - V_B) \times N \times F]/W$$

V_S = volume of 1 N sodium hydroxide consumed by the sample (mL)

V_B = volume of 1 N sodium hydroxide consumed by the blank test (mL)

N = actual normality of 1 N sodium hydroxide (mEq/mL)

F = molecular weight of potassium hydroxide, 56.11

W = weight of Stearyl Alcohol (g)

Acceptance criteria: 195–220

- **FATS AND FIXED OILS, Iodine Value <401>**: NMT 2

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methanol in the portion of Sucralose taken:

$$\text{Result} = (R_U/R_S) \times [(C_S/C_U) \times F_1] \times F_2 \times 100$$

R_U = peak response ratio of methanol to *n*-propyl alcohol, from the *Sample solution*

R_S = peak response ratio of methanol to *n*-propyl alcohol, from the *Standard solution*

C_S = concentration of methanol in the *Standard solution* (μL/mL)

C_U = concentration of Sucralose in the *Sample solution* (g/mL)

F_1 = conversion factor from μL to mL

F_2 = specific gravity of methanol, 0.79 g/cm³

Acceptance criteria: NMT 0.1%

• RELATED COMPOUNDS

Adsorbent: 0.20-mm layer of octadecylsilanized chromatographic silica gel. The thin-layer chromatographic plate also has a preadsorbent zone.

Detection reagent: Sulfuric acid in methanol (3 in 20)

Standard solution A: 10.0 mg/mL of USP Sucralose RS in methanol

Standard solution B: 0.5 mL *Standard solution A* diluted to 10.0 mL with methanol

Sample solution: 100.0 mg/mL of Sucralose in methanol

Developing solvent system: Acetonitrile and sodium chloride solution (1 in 20) (3:7)

Application volume: 5 μL

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Proceed as directed under *Chromatography* <621>, *Thin-Layer Chromatography*. Spray the plate with *Detection reagent*. Heat the plate for 10 min at 125°.

Acceptance criteria: The R_f value of the principal spot from the *Sample solution* corresponds to that obtained from *Standard solution A*, and the color of any other single spot from the *Sample solution* is not more intense than that of the principal spot from *Standard solution B* (0.5%).

• LIMIT OF HYDROLYSIS PRODUCTS [NOTE—This test does not require a developing solvent.]

Adsorbent: 0.25-mm layer of chromatographic silica gel

Spray reagent: 12.3 mg/mL of *p*-anisidine and 16.6 mg/mL of phthalic acid in methanol. Store the solution in the dark and refrigerate to prevent discoloration. Discard if the solution becomes discolored. [CAUTION—*p*-Anisidine is toxic if inhaled or if absorbed through the skin.]

Standard solution A: 100 mg/mL of mannitol

Standard solution B: 0.4 mg/mL of fructose and 100 mg/mL of mannitol

Sample solution: 250 mg/mL of Sucralose in methanol

Application volume: 5- μL portions separately applied in 1- μL increments, allowing the plate to dry between applications

Analysis

Samples: *Standard solution* and *Sample solution*
Proceed as directed under *Chromatography* <621>, *Thin-Layer Chromatography*. Spray the plate with *Spray reagent*, and heat the plate at 100 \pm 2° for 15 min. If the spot from *Standard solution A* has darkened, repeat the test, heating for a shorter period of time. Immediately after heating, view the plate against a dark background.

Acceptance criteria: The color of the spot from the *Sample solution* is not more intense than that from *Standard solution B* (0.1%).

SPECIFIC TESTS

• OPTICAL ROTATION, *Specific Rotation* <781S>: +84.0° to +87.5° at 20°

Sample solution: 10 mg/mL of Sucralose

• WATER DETERMINATION, *Method I* <921>: NMT 2.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in well-closed containers, in a cool, dry place, at a temperature not exceeding 21°.

Change to read:

Sucrose

$\text{C}_{12}\text{H}_{22}\text{O}_{11}$

342.30

α -D-Glucopyranoside, β -D-fructofuranosyl;
Sucrose [57-50-1].

DEFINITION

Sucrose is a sugar obtained from *Saccharum officinarum* Linné (Fam. Gramineae), *Beta vulgaris* Linné (Fam. Chenopodiaceae), and other sources. It contains no added substances.

IMPURITIES

• RESIDUE ON IGNITION <281>

Sample: 5 g

Acceptance criteria: NMT 0.05%

• CHLORIDE AND SULFATE, *Chloride* <221>

Sample: 2.0 g

Acceptance criteria: 0.0035%; the *Sample* shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid.

• CHLORIDE AND SULFATE, *Sulfate* <221>

Sample: 5.0 g

Acceptance criteria: 0.006%; the *Sample* shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid.

• CALCIUM

Analysis: To 10 mL of a solution (1 in 10) add 1 mL of ammonium oxalate TS.

Acceptance criteria: The solution remains clear for at least 1 min.

• HEAVY METALS <231>

Sample: 4.0 g

Analysis: Dissolve the *Sample* in 15 mL of water, add 1 mL of 0.12 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 5 ppm

SPECIFIC TESTS

• OPTICAL ROTATION, *Specific Rotation* <781S>

Sample solution: Previously dried Sucrose at 105° for 2 h. Prepare a solution of 260 mg/mL of Sucrose in water.

Acceptance criteria: NLT +65.9°

• INVERT SUGAR

Sample solution: 200 mg/mL of Sucrose in water.

[NOTE—Filter if necessary.]

Analysis: Place 50 mL of the clear liquid in a 250-mL beaker, add 50 mL of alkaline cupric tartrate TS, cover the beaker with a watch glass, and heat the mixture at such a rate that it comes to a boil in approximately 4 min, and boil for 2 min, accurately timed. Add at once 100 mL of cold, recently boiled water, and immediately collect the precipitated cuprous oxide on a tared filtering crucible containing a sintered-glass disk of medium pore size, or suitable equivalent. Thoroughly wash the residue on the filter with hot water, then with 10 mL of alcohol, and finally with 10 mL of ether, and dry at 105° for 1 h.

Acceptance criteria: The weight of the cuprous oxide does not exceed 112 mg.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. ● (RB 1-Apr-2012)

Sucrose Octaacetate

$C_{28}H_{38}O_{19}$ 678.59
 α -D-Glucopyranoside, 1,3,4,6-tetra-O-acetyl- β -D-fructofuranosyl, tetraacetate;
 Sucrose octaacetate [126-14-7].

DEFINITION

Sucrose Octaacetate contains NLT 98.0% and NMT 100.5% of sucrose octaacetate ($C_{28}H_{38}O_{19}$), calculated on the anhydrous basis.

ASSAY• **PROCEDURE**

Sample: 100 mg in a 500-mL conical flask

Blank: 50 mL of 70% alcohol

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Residual titration

Titrant: 0.1 N sodium hydroxide VS

Back-titrant: 0.1 N sulfuric acid VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 50 mL of 70% alcohol. Neutralize the solution with 0.1 N sodium hydroxide VS, using phenolphthalein TS as the indicator. Add 25.0 mL of 0.1 N sodium hydroxide VS, attach an air condenser to the flask, protect from absorption of carbon dioxide, and reflux on a steam bath for 1 h. Remove from the steam bath, cool quickly, and titrate the excess alkali with 0.1 N sulfuric acid VS, using phenolphthalein TS as the indicator. Perform a blank determination.

Calculate the percentage of sucrose octaacetate ($C_{28}H_{38}O_{19}$) in the portion of Sucrose Octaacetate taken.

Each mL of 0.1 N sodium hydroxide is equivalent to 8.483 mg of $C_{28}H_{38}O_{19}$.

Acceptance criteria: 98.0%–100.5% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.1%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** <741>: NLT 78°

• **ACIDITY**

Sample: 1 g

Analysis: Dissolve the *Sample* in 20 mL of neutralized alcohol, and add 2 drops of phenolphthalein TS.

Acceptance criteria: NMT 2 drops of 0.1 N sodium hydroxide are required to produce a red color.

- **WATER DETERMINATION, Method I** <921>: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Sucrose Palmitate

$C_{28}H_{52}O_{12}$ 580.71

$C_{44}H_{82}O_{13}$ 819.11

$C_{60}H_{112}O_{14}$ 1057.52

Sucrose monopalmitate;

Sucrose hexadecanoate [26446-38-8].

DEFINITION

Sucrose Palmitate is a mixture of sucrose monoesters, mainly sucrose monopalmitate, obtained by transesterification of palmitic acid methyl esters of vegetable origin with sucrose. The manufacture of the fatty acid methyl esters includes a distillation step. It contains variable quantities of mono- and diesters as set forth in the following table:

Content of Monoesters (%)	Content of Diesters (%)	Sum of Triesters and Polyesters (%)
NLT 55.0	NMT 40.0	NMT 20.0

IDENTIFICATION

- **A.** It meets the requirements of the *Fatty Acid Composition* test.
- **B.** It meets the requirements of the *Content of Monesters, Diesters, Triesters, and Polyesters*.

ASSAY

- **CONTENT OF MONOESTERS, DIESTERS, TRIESTERS, AND POLYESTERS**

Mobile phase: Tetrahydrofuran

Sample solution: 15 mg/mL of Sucrose Palmitate in tetrahydrofuran

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC, size-exclusion

Detector: Differential refractometer

Column: 7-mm \times 60-cm; packing L21, 100 Å

[NOTE—Two 7-mm \times 30-cm L21 columns may be used in place of one 60-cm column, provided system suitability requirements are met.]

Flow rate: 1.2 mL/min

Injection size: 20 μ L

Analysis

Sample: *Sample solution*

[NOTE—The relative retention time with reference to the monoester peak (retention time is approximately 10 min) is about 0.92 for diesters, and about 0.90 for triesters and polyesters.]

[NOTE—Disregard solvent peaks and peaks having a signal-to-noise ratio less than 10.]

Calculate the percentage of monoesters in the portion of Sucrose Palmitate taken:

$$\text{Result} = A \times (100 - D - S - E)/100$$

- A = percentage of monoesters determined by peak normalization
 D = percentage of free fatty acids, using the following formula:

$$\text{Result} = AV \times 256/561.1$$

- AV = acid value
 S = percentage of free sucrose (see *Free Sucrose in Organic Impurities*)
 E = percentage of water (see *Water Determination, la in Specific Tests*)

Calculate the percentage of diesters in the portion of Sucrose Palmitate taken:

$$\text{Result} = B \times (100 - D - S - E)/100$$

- B = percentage of diesters determined by peak normalization
 D = percentage of free fatty acids (above)
 S = percentage of free sucrose (see *Free Sucrose in Organic Impurities*)
 E = percentage of water (see *Water Determination, la in Specific Tests*)

Calculate the percentage of triesters and polyesters in the portion of Sucrose Palmitate taken:

$$\text{Result} = C \times (100 - D - S - E)/100$$

- C = percentage of triesters and polyesters determined by peak normalization
 D = percentage of free fatty acids (above)
 S = percentage of free sucrose (see *Free Sucrose in Organic Impurities*)
 E = percentage of water (see *Water Determination, la in Specific Tests*)

- **FATTY ACID COMPOSITION:** Sucrose Palmitate exhibits the following composition profiles of fatty acids, as determined under *Fats and Fixed Oils, Fatty Acid Composition* (401).

Fatty Acid	Percentage (%)
Lauric acid	NMT 3.0
Myristic acid	NMT 3.0
Palmitic acid	70.0–85.0
Stearic acid	10.0–25.0
Sum of the contents of palmitic acid and stearic acid	NLT 90.0

IMPURITIES

Inorganic Impurities

- **FATS AND FIXED OILS, Acid Value (401):** NMT 6.0%, determined on a 3-g sample. Use a freshly neutralized mixture of 2-propanol and water (2:1), and gently heat.

Organic Impurities

- **PROCEDURE: FREE SUCROSE**

Solution A: 10 µg/mL of ammonium acetate in acetonitrile

Solution B: 10 µg/mL of ammonium acetate in tetrahydrofuran and water (90:10)

Diluent: Tetrahydrofuran and water (87.5:12.5)

System suitability solution: 500 µg/mL of USP Sucrose RS in *Diluent*

Standard solutions: 0.50, 1.0, 2.0, and 2.5 mg/mL of USP Sucrose RS in *Diluent*

Sample solution: 50 mg/mL of Sucrose Palmitate in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Evaporative light-scattering. [NOTE—If the detector has different setting parameters, adjust the detector settings so that they comply with the *System suitability* requirements.]

Carrier gas: Nitrogen

Detector temperature: 45°

Nebulizer temperature: 40°

Column: 4.6-mm × 0.25-m; packing L8

Injection size: 20 µL

Mobile phase and flow rate: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Flow Rate (mL/min)
1	100	0	1.0
8	0	100	1.0
7	0	100	1.0
0.01	0	100	2.5
15.99	0	100	2.5
1	100	0	2.5
3	100	0	1.0

System suitability

Sample: *System suitability solution*

[NOTE—The retention time is about 26 min for sucrose palmitate.]

Suitability requirements

Signal-to-noise ratio: 10:1

Analysis

Samples: *Standard solutions* and *Sample solution*

Prepare a standard curve by plotting the peak response versus concentration of sucrose in the *Standard solutions*. Calculate the amount of free sucrose in the Sucrose Palmitate taken.

Acceptance criteria: NMT 4.0%

SPECIFIC TESTS

- **WATER DETERMINATION, Method la (921):** NMT 4.0% on a 0.20-g sample

- **TOTAL ASH**

Sample: 1.0 g

Analysis: Heat a silica or platinum crucible to redness for 30 min, allow to cool in a desiccator, and weigh. Transfer the *Sample* into the crucible. Dry at 100°–105° for 1 h and ignite to constant weight in a muffle furnace at 600 ± 25°, allowing the crucible to cool in a desiccator after each ignition. Flames should not be produced at any time during the procedure. If after prolonged ignition the ash still contains black particles, add hot water, filter through an ashless filter paper, and ignite the residue and the filter paper. Combine the filtrate with the ash, carefully evaporate to dryness and ignite to constant weight.

Acceptance criteria: NMT 1.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in a well-closed container. Protect from humidity and avoid high temperatures.
- **USP REFERENCE STANDARDS (11)**
 USP Sucrose RS

Sucrose Stearate

R = H or

$C_{48}H_{90}O_{13}$ 875.22
 $C_{66}H_{124}O_{14}$ 1141.68
 Sucrose monostearate;
 Sucrose octadecanoate [25168-73-4].

DEFINITION

Sucrose Stearate is a mixture of sucrose esters, mainly sucrose stearate, obtained by transesterification of stearic acid methyl esters derived from vegetable origin with sucrose. The manufacture of the fatty acid methyl esters includes a distillation step. The mono- and diesters requirements differ for the two types of sucrose stearate as set forth in the following table.

	Content of Monoesters (%)	Content of Diesters (%)	Sum of Triesters and Polyesters (%)
Type I	NLT 50.0	NMT 40.0	NMT 25.0
Type II	20.0–45.0	30.0–40.0	NMT 30.0

IDENTIFICATION

- **A.** It meets the requirements of the *Fatty Acid Composition* test.
- **B.** It meets the requirements of *Content of Monoesters, Diesters, Triesters, and Polyesters*.

ASSAY

System suitability

Sample: *System suitability solution*

[NOTE—The retention time for sucrose stearate is about 26 min.]

Suitability requirements

Signal-to-noise ratio: 10:1

Analysis

Samples: *Standard solutions* and *Sample solution*

Prepare a standard curve by plotting the peak response versus concentration of sucrose in the *Standard solution*. Calculate the quantity of free sucrose in the Sucrose Stearate taken.

Acceptance criteria: NMT 4.0%

SPECIFIC TESTS

- **WATER DETERMINATION, Method 1a (921):** NMT 4.0%, on a 0.20-g sample

• **TOTAL ASH**

Analysis: Heat a silica or platinum crucible to redness for 30 min, allow to cool in a desiccator, and weigh. Transfer a 1.0-g sample into a crucible. Dry at 100°–105° for 1 h and ignite to constant weight in a muffle furnace at 600 ± 25°, allowing the crucible to cool in a desiccator after each ignition. Flames should not be produced at any time during the procedure. If after prolonged ignition the ash still contains black particles, add hot water, pass through an ashless filter paper, and ignite the residue and the filter paper. Combine the filtrate with the ash, carefully evaporate to dryness, and ignite to constant weight.

Acceptance criteria: NMT 1.5%

ADDITIONAL REQUIREMENTS

- **LABELING:** Label to indicate whether it is Type I or Type II.
- **PACKAGING AND STORAGE:** Preserve in a well-closed container. Protect from humidity and avoid high temperatures.
- **USP REFERENCE STANDARDS (11)**
USP Sucrose RS

Compressible Sugar**DEFINITION**

Compressible Sugar, previously dried at 105° for 4 h, contains NLT 95.0% and NMT 98.0% of sucrose (C₁₂H₂₂O₁₁). It may contain starch, maltodextrin, or invert sugar, and may contain a suitable lubricant.

IDENTIFICATION

- **A.** The specific rotation of the *Uninverted solution* obtained in the Assay is NLT 62.6°, and the *Acid-inverted solution* obtained in the Assay is levorotatory.

ASSAY• **PROCEDURE**

Sample solution: Transfer 26.0 g of Compressible Sugar, previously dried, to a 100-mL volumetric flask. Add 0.3 mL of a saturated aqueous solution of lead acetate, shake with 90 mL of water, and dilute with water to volume. Distribute evenly on the surface of a sheet of medium-fast filter paper 8 g of chromatographic siliceous earth suitable for column partition chromatography (see *Reagents, Indicators, and Solutions—Reagents*), and filter the solution, with the aid of vacuum, discarding the first 20 mL of the filtrate.

Instrumental conditions

(See *Optical Rotation* (781).)

Mode: Specific rotation

Temperature: 20°

Analysis

Uninverted solution: Pipet 25 mL of the *Sample solution* into a 50-mL volumetric flask. Cool to 20°, and dilute with water to volume at 20°. Maintain a temperature of 20° for 30 min.

Acid-inverted solution: Pipet 25 mL of the *Sample solution* into a 50-mL volumetric flask. Slowly add 6 mL of dilute hydrochloric acid (1 in 2) while rotating it, dilute with water nearly to volume, and mix. Place the flask in a water bath maintained at a temperature of 60°, continuously shake the flask in the bath for 3 min, and allow the flask to remain in the bath for a total of 10 min. Immediately cool to 20° by plunging the flask into a cold bath, and dilute with water to volume at 20°. Maintain the flask at a temperature of 20° for 30 min.

Determine the specific rotation of the *Uninverted solution* and *Acid-inverted solution* at 20°.

Calculate the percentage of sucrose (C₁₂H₂₂O₁₁) in the portion of Compressible Sugar taken:

$$\text{Result} = [(\alpha_o - \alpha_i)/88.3] \times 100$$

α_o = specific rotation of the *Uninverted solution*

α_i = specific rotation of the *Acid-inverted solution*

Acceptance criteria: 95.0%–98.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%

• **CHLORIDE AND SULFATE, Chloride (221)**

Standard solution: 0.40 mL of 0.020 N hydrochloric acid

Sample solution: Transfer 20 g to a 100-mL volumetric flask, add 80 mL of water, shake to dissolve the sucrose, then add water to volume. Separate the solubilized sucrose from any insoluble matter by filtration until the filtrate is sparkling clear, and use the freshly prepared, clear filtrate.

Acceptance criteria: 0.014%; a 10-mL portion of the *Sample solution* shows no more chloride than the *Standard solution*.

• **CHLORIDE AND SULFATE, Sulfate (221)**

Standard solution: 0.50 mL of 0.020 N sulfuric acid

Sample solution: 25 mL of the *Sample solution* obtained from the test for *Chloride and Sulfate, Chloride (221)*

Acceptance criteria: 0.010%; the *Sample solution* shows no more sulfate than the *Standard solution*.

• **IDENTIFICATION TESTS—GENERAL, Calcium (191)**

Sample solution: 5 mL of the *Sample solution* obtained from the test for *Chloride and Sulfate, Chloride (221)*

Analysis: To the *Sample solution* add 1 mL of ammonium oxalate TS.

Acceptance criteria: The solution remains clear for NLT 1 min.

• **HEAVY METALS (231)**

Sample solution: 20 mL of the *Sample solution* obtained from the test for *Chloride and Sulfate, Chloride (221)*

Analysis: To the *Sample solution* add 4 mL of water and 1 mL of 0.1 N hydrochloric acid.

Acceptance criteria: NMT 5 µg/g

SPECIFIC TESTS• **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the tests for the absence of *Salmonella* species and *Escherichia coli*.

- **LOSS ON DRYING** (731)
Analysis: Dry at 105° for 4 h.
Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Confectioner's Sugar

DEFINITION

Confectioner's Sugar is Sucrose ground together with corn starch to a fine powder. It contains NLT 95.0% of sucrose ($C_{12}H_{22}O_{11}$), calculated on the dried basis.

IDENTIFICATION

- **A.**
Sample solution: Transfer 20 g to a 100-mL volumetric flask, add 80 mL of water, shake to dissolve the sucrose, then add water to volume. Separate the solubilized sucrose from the insoluble starch component by filtration until the filtrate is sparkling clear. Use the insoluble portion for the *Identification* test, and use the freshly prepared, clear filtrate for the tests in *Impurities* for *Chloride and Sulfate*, *Chloride* (221) and *Sulfate* (221), and for *Calcium*; and in *Specific Tests* for *Optical Rotation*, *Specific Rotation* (781).
Analysis: To the water slurry of the insoluble portion add iodine TS.
Acceptance criteria: A reddish-violet to deep blue color is produced.

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.08%
- **CHLORIDE AND SULFATE**, *Chloride* (221)
Standard solution: 0.40 mL of 0.020 N hydrochloric acid
Sample solution: 10 mL of the clear filtrate obtained from *Identification* test A
Acceptance criteria: 0.014%; the *Sample solution* shows no more chloride than the *Standard solution*.
- **CHLORIDE AND SULFATE**, *Sulfate* (221)
Standard solution: 0.30 mL of 0.020 N sulfuric acid
Sample solution: 25 mL of the clear filtrate obtained from *Identification* test A
Acceptance criteria: 0.006%; the *Sample solution* shows no more sulfate than the *Standard solution*.
- **CALCIUM**
Sample solution: 5 mL of the clear filtrate obtained from *Identification* test A
Analysis: To the *Sample solution* add 5 mL of water and 1 mL of ammonium oxalate TS.
Acceptance criteria: The *Sample solution* remains clear for NLT 1 min.
- **HEAVY METALS** (231)
Sample solution: 20 mL of the clear filtrate obtained from *Identification* test A
Analysis: To the *Sample solution* add 4 mL of water and 1 mL of 0.1 N hydrochloric acid.
Acceptance criteria: NMT 5 µg/g

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **LOSS ON DRYING** (731)
Analysis: Dry at 105° for 4 h.
Acceptance criteria: NMT 1.0%
- **OPTICAL ROTATION**, *Specific Rotation* (781)
Sample solution: Clear filtrate obtained from *Identification* test A

Acceptance criteria: NLT +62.6°, corresponding to NLT 95.0% of sucrose ($C_{12}H_{22}O_{11}$), calculated on the dried basis

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Sugar Spheres

DEFINITION

Sugar Spheres contain NLT 62.5% and NMT 91.5% of sucrose ($C_{12}H_{22}O_{11}$), calculated on the dried basis, the remainder consisting chiefly of starch. They consist of approximately spherical particles of a labeled nominal size range. They may contain color additives permitted by the FDA for use in drugs.

IDENTIFICATION

- **A.**
Sample suspension: 1:10
Analysis: Add iodine TS to the *Sample suspension*.
Acceptance criteria: A violet to deep blue color is produced.

ASSAY

- **OPTICAL ROTATION**, *Specific Rotation* (781S)
Sample solution: Transfer 20 g to a 200-mL volumetric flask, add 160 mL of water, shake to dissolve the sucrose, add water to volume, and mix. Pass the solubilized sucrose solution by vacuum filtration through fine filter paper.
Acceptance criteria: +41° to +61°, corresponding to 62.5%–91.5% of sucrose ($C_{12}H_{22}O_{11}$), calculated on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281)
Sample: 2.0 g
Analysis: Ignite at a temperature of 700 ± 25°.
Acceptance criteria: NMT 0.25%
- **HEAVY METALS**, *Method II* (231): 5 µg/g

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10² cfu/g, and the Spheres meet the requirements of the tests for absence of *Salmonella* species, *Escherichia coli*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*.
- **LOSS ON DRYING** (731)
Analysis: Dry at 105° for 4 h.
Acceptance criteria: NMT 4.0%
- **PARTICLE SIZE DISTRIBUTION ESTIMATION BY ANALYTICAL SIEVING** (786): NLT 90% of it passes the coarser sieve size stated in the labeling; all of it passes the next coarser sieve size listed in *Table 1* of the chapter; and NMT 10% passes the finer sieve size stated in the labeling.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The label states the nominal particle size range.

Sulfur Dioxide

SO₂ 64.06
Sulfur dioxide [7446-09-5].

DEFINITION

Sulfur Dioxide contains NLT 97.0%, by volume, of sulfur dioxide (SO₂).

[CAUTION—Sulfur Dioxide is poisonous.]

ASSAY

• PROCEDURE

Sample: 100.0 mL of gaseous Sulfur Dioxide

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 0.1 N iodine VS

Endpoint detection: Visual

Analysis: Collect the *Sample* over mercury, and note the temperature of the *Sample* and the pressure upon it. Slowly introduce 50.0 mL of 0.1 N sodium hydroxide into the air space over the mercury, and absorb the *Sample* in the solution by shaking. When absorption is complete, transfer the solution to a 250-mL conical flask, add 3 mL of starch TS, and titrate with *Titrant* until the solution is pale blue in color.

Calculate the percentage of sulfur dioxide (SO₂) at a temperature of 0° and a pressure of 760 mm of mercury in the portion of Sulfur Dioxide taken. Each mL of 0.1 N iodine is equivalent to 1.094 mL of SO₂.

Acceptance criteria: NLT 97.0%, by volume

IMPURITIES

• LIMIT OF NONVOLATILE RESIDUE

Sample: 300 g (209 mL)

Analysis: Transfer the *Sample* to a tared, 250-mL conical flask, and allow the liquid to evaporate spontaneously in a well-ventilated hood. When evaporation appears complete, blow a current of dry, filtered air through the flask until the odor of sulfur dioxide is no longer apparent.

Acceptance criteria: NMT 7.5 mg (0.0025%)

• SULFURIC ACID

Analysis: To the flask containing the residue obtained in the test for *Limit of Nonvolatile Residue* add 25 mL of water previously neutralized to methyl red TS. Swirl the flask, and titrate with 0.10 N sodium hydroxide.

Acceptance criteria: NMT 1.3 mL is required (about 0.002%).

SPECIFIC TESTS

• WATER DETERMINATION, Method I <921>

Sample: 3 g (2.1 mL)

Analysis: Taking precautions to avoid absorption of moisture, transfer the *Sample* to a suitable flask, and add 20 mL of anhydrous pyridine.

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in cylinders.

[NOTE—Sulfur Dioxide is used most in the form of a gas in pharmaceutical applications, and is described herein for such purposes. However, it is usually packaged under pressure, hence the preceding specifications are designed for testing it in liquid form.]

Sulfuric Acid

H₂SO₄ 98.08
Sulfuric acid [7664-93-9].

DEFINITION

Sulfuric Acid contains NLT 95.0% and NMT 98.0%, by weight, of sulfuric acid (H₂SO₄).

[CAUTION—When sulfuric acid is to be mixed with other liquids, always add it to the diluent, and exercise great caution.]

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Sulfate <191>:** Meets the requirements

ASSAY

• PROCEDURE

Sample solution: Place 1 mL of Sulfuric Acid in a weighed, glass-stoppered flask containing 20 mL of water, and weigh again to obtain the weight of the Sulfuric Acid. Dilute with 25 mL of water, and cool.

Titrimetric system

(See *Titrimetry* <541>.)

Mode: Direct titration

Titrant: 1 N sodium hydroxide VS

Blank: 45 mL of water

Endpoint detection: Visual

Analysis: To the *Sample solution* add methyl orange TS, and titrate with 1 N sodium hydroxide VS. Perform a blank determination. Calculate the percentage of sulfuric acid (H₂SO₄) taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant volume consumed by sulfuric acid in the Sample solution (mL)*

V_B = *Titrant volume consumed by the Blank (mL)*

N = *Titrant actual normality (mEq/mL)*

F = *equivalency factor, 49.04 mg/mEq*

W = *weight of sulfuric acid in the Sample solution (mg)*

Acceptance criteria: 95.0%–98.0%

IMPURITIES

• RESIDUE ON IGNITION <281>

Sample: 22 mL (40 g)

Analysis: Evaporate the *Sample* to dryness, and ignite.

Acceptance criteria: NMT 2 mg of residue remains (0.005%).

- **CHLORIDE AND SULFATE, Chloride <221>:** A dilution of 1.1 mL (2.0 g) in water shows no more chloride than corresponds to 0.15 mL of 0.020 N hydrochloric acid (50 ppm).

• ARSENIC <211>

Test preparation: Add 1.6 mL (3.0 g) to a mixture of nitric acid and water (3:20). Evaporate the solution until dense fumes of sulfur trioxide form. Cool, and cautiously wash the solution into an arsine generating flask with 50 mL of water.

Analysis: Proceed as directed in the chapter, omitting the addition of the 20 mL of 7 N sulfuric acid.

Acceptance criteria: NMT 1 ppm

• HEAVY METALS <231>

Test preparation: Add 2.2 mL (4.0 g) to 10 mg of sodium carbonate dissolved in 10 mL of water. Heat until almost dry. Add 1 mL of nitric acid, and evaporate to dryness. Add 2 mL of 1 N acetic acid to the residue, and dilute with water to 25 mL.

Analysis: Proceed as directed in the chapter.

Acceptance criteria: NMT 5 ppm

SPECIFIC TESTS

• REDUCING SUBSTANCES

Sample: 4.4 mL (8.0 g)

Analysis: Carefully dilute the *Sample* with 50 mL of ice-cold water, keeping the solution cold during the addition. Add 0.10 mL of 0.10 N potassium permanganate.

Acceptance criteria: The solution remains pink for 5 min.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Sunflower Oil**DEFINITION**

Sunflower Oil is a refined fixed oil obtained from the seeds of the sunflower plant *Helianthus annuus* Linné (Fam. Asteraceae alt. Compositae).

IMPURITIES

- **HEAVY METALS, Method II** (231): NMT 10 ppm

SPECIFIC TESTS

- **FATS AND FIXED OILS, Acid Value (Free Fatty Acids)** (401): NMT 2.5 mL of 0.020 N sodium hydroxide is required for neutralization.

- **FATS AND FIXED OILS, Fatty Acid Composition** (401)

Standard solution: Prepare an ester mixture containing methyl linoleate, methyl oleate, methyl palmitate, methyl stearate, and methyl linolenate (50:35:7:5:3).¹

Sample solution: Transfer 100 mg of Sunflower Oil to a 50-mL conical flask fitted with a suitable water-cooled reflux condenser and a magnetic stir bar. Add 4 mL of 0.5 N methanolic sodium hydroxide solution, and reflux until fat globules disappear (usually 5–10 min). Add 5 mL of a solution prepared by dissolving 14 g of boron trifluoride in methanol to make 100 mL, swirl to mix, and reflux for 2 min. Add 4 mL of chromatographic *n*-heptane through the condenser, and reflux for 1 min. Cool, remove the condenser, add 15 mL of saturated sodium chloride solution, shake, and allow the layers to separate. Pass the *n*-heptane layer through 0.1 g of anhydrous sodium sulfate (previously washed with chromatographic *n*-heptane) into a suitable flask. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with chromatographic *n*-heptane to volume, and mix.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-m fused-silica capillary column bonded with a 0.25-μm layer of phase G5

Temperature

Injector: 220°

Detector: 250°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
120	—	120	2
120	4	240	5

Carrier gas: Hydrogen

Flow rate: 1 mL/min

Injection size: 1 μL

Injection type: Splitless

System suitability

Sample: Standard solution

[NOTE—The relative retention times for methyl palmitate, methyl stearate, and methyl oleate are about 0.87, 0.99, and 1.0, respectively.]

¹Ester mixtures are available commercially from Nu-Chek-Prep, Inc., P.O. Box 295, Elysian, MN 56028. Typical Nu-Chek-Prep ester mixtures useful in this test include Nu-Chek 15A. This mixture may contain other components.

Suitability requirements

Resolution: NLT 1.5 between methyl stearate and methyl oleate

Relative standard deviation: NMT 6.0% peak area responses for the palmitate and stearate peaks for replicate injections; NMT 1.0% peak area response ratio of the palmitate to stearate peaks from these replicate injections

Analysis

Samples: Standard solution and Sample solution

Measure the areas of the five major peaks for the methyl esters of the fatty acids, which elute in the following order: palmitate, stearate, oleate, linoleate, and linolenate.

Calculate the percentage of palmitate, stearate, oleate, linoleate, and linolenate in the portion of Sunflower Oil taken:

$$\text{Result} = (A/B) \times 100$$

A = peak area of palmitate, stearate, oleate, linoleate, or linolenate

B = total area of the five major peaks

Acceptance criteria: See Table 2.

Table 2

	Generic Oil (%)	Mid-Oleic Oil (%)	High-Oleic Oil (%)
Methyl palmitate	3–10	2–9	2–9
Methyl stearate	2–8	2–8	2–8
Methyl oleate	14–24	40–70	70–90
Methyl linoleate	63–73	15–40	5–15
Methyl linolenate	0–3	0–3	0–3

- **FATS AND FIXED OILS, Iodine Value, Method II** (401)

Acceptance criteria

Generic oil: 128–148

Mid-oleic oil: 98–118

High-oleic oil: 78–98

- **FATS AND FIXED OILS, Saponification Value** (401): 180–200

- **FATS AND FIXED OILS, Unsaponifiable Matter** (401): NMT 1.0%

Change to read:

- **LIMIT OF PEROXIDE**

[NOTE—This test must be performed promptly after sampling to avoid oxidation of the test specimen.]

Solvent A: Chloroform and glacial acetic acid (40:60)

Potassium iodide solution: Prepare a saturated solution of potassium iodide in freshly boiled and cooled water, and store protected from light. [NOTE—Discard the solution if it becomes colored upon addition of Solvent A and iodide-free starch TS.] (ERR 1-May-2012)]

Sample: 10 g of Sunflower Oil

Analysis: Transfer the Sample to a conical flask, add 30 mL of Solvent A, and swirl to dissolve. Add 0.5 mL of Potassium iodide solution, swirl for 1.0 min, and add 30 mL of water. Titrate with 0.01 N sodium thiosulfate VS, with vigorous agitation, to a light yellow color. Add 2.0 mL of iodide-free starch TS, and continue the titration until the blue color has disappeared. Perform a blank determination, and make any necessary correction.

Calculate the amount of peroxide, in mEq/kg, in the portion of Sunflower Oil taken:

$$\text{Result} = (V \times N/W) \times F$$

V = volume of sodium thiosulfate used in the titration (mL)

N = normality of sodium thiosulfate VS (mEq/mL)

W = weight of Sunflower Oil taken (g)

F = conversion factor, 1000 g/kg

Acceptance criteria: NMT 10.0 mEq/kg

• **REFRACTIVE INDEX** (831): 1.472–1.474 at 20°

• **SPECIFIC GRAVITY** (841): 0.914–0.924 at 20°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. No storage requirement specified.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant source from which the article was derived. The label also indicates the name and concentration of any additive.

Suspension Structured Vehicle

DEFINITION

Prepare Suspension Structured Vehicle as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Potassium Sorbate	0.15 g
Xanthan Gum	0.15 g
Citric Acid, Anhydrous	0.15 g
Sucrose	20 g
Purified Water, a sufficient quantity to make	100 mL

Transfer the *Potassium Sorbate* to a suitable beaker, and dissolve in 50 mL of *Purified Water*. Place the beaker on an electric hot plate and stirrer, and add the *Xanthan Gum* into the vortex while slowly stirring. Apply minimal heat, and incorporate the *Citric Acid* and the *Sucrose*. Add a sufficient quantity of *Purified Water* to obtain a final volume of 100 mL, and mix.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at room temperature, and avoid freezing.
- **LABELING:** Label it to state that it must be well shaken before use.
- **BEYOND-USE DATE:** NMT 30 days after the date on which it was compounded

Sugar-Free Suspension Structured Vehicle

DEFINITION

Prepare Sugar-Free Suspension Structured Vehicle as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Xanthan Gum	0.20 g
Saccharin Sodium	0.20 g
Potassium Sorbate	0.15 g
Citric Acid	0.10 g
Sorbitol	2.0 g
Mannitol	2.0 g
Glycerin	2.0 mL
Purified Water, a sufficient quantity to make	100 mL

Transfer 30 mL of *Purified Water* to a beaker, placing it on an electric hot plate and stirrer. Using moderate heat, stir to form a vortex, and slowly sprinkle the *Xanthan Gum* into the vortex. In a separate beaker, dissolve the *Saccharin*

Sodium, Potassium Sorbate, and *Citric Acid* in 50 mL of *Purified Water*. Using moderate heat, incorporate the *Sorbitol*, *Mannitol*, and *Glycerin* into this mixture. Add to this mixture the previously prepared xanthan gum dispersion. Add a sufficient quantity of *Purified Water* to obtain a final volume of 100 mL, and mix.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at room temperature, and avoid freezing.
- **LABELING:** Label it to state that it must be well shaken before use.
- **BEYOND-USE DATE:** NMT 30 days after the date on which it was compounded

Syrup

DEFINITION

Syrup is a solution of *Sucrose* in *Purified Water*. It contains a preservative unless it is used when freshly prepared.

Sucrose	850 g
Purified Water, a sufficient quantity to make	1000 mL

Syrup may be prepared by the use of boiling water or, preferably, without heat, by the following process. Place the *Sucrose* in a suitable percolator, the neck of which is nearly filled with loosely packed cotton, moistened after packing with a few drops of water. Pour carefully 450 mL of *Purified Water* upon the *Sucrose*, and regulate the outflow to a steady drip of percolate. Return the percolate, if necessary, until all of the *Sucrose* has dissolved. Then wash the inside of the percolator and the cotton with sufficient *Purified Water* to bring the volume of the percolate to 1000 mL, and mix.

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): NLT 1.30

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers, preferably in a cool place.

Tagatose

C₆H₁₂O₆

D-Tagatose;

D-lyxo-Hexulose [87-81-0].

180.16

DEFINITION

Tagatose is a ketohexose, an epimer of D-fructose inverted at C-4. It is obtained from D-galactose by isomerization under alkaline conditions in the presence of calcium. It contains NLT 98.0% of tagatose (C₆H₁₂O₆), calculated on the dried basis.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** It meets the requirements of the test for *Optical Rotation* (781), *Specific Rotation*.

• **C.**

Sample solution: 200 mg/mL of Tagatose

Analysis: Add 3 mL of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

ASSAY• **PROCEDURE**

Mobile phase: 0.05 mg/mL of calcium acetate

Standard solution: 5 mg/mL of USP Tagatose RS. Pass through a filter of 0.2- μ m pore size.

Sample solution: 5 mg/mL of Tagatose, previously dried. Pass through a filter of 0.2- μ m pore size.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm \times 30-cm; 9- μ m packing L19

Column temperature: 85°

Flow rate: 0.6 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0% of replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tagatose (C₆H₁₂O₆) in the portion of Tagatose taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Tagatose RS in the *Standard solution* (mg/mL)

C_U = concentration of Tagatose in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 98.0% on the dried basis

IMPURITIES• **LIMIT OF LEAD**

Sample solution: 2.5 g of Tagatose dissolved in a mixture of 4 mL of sulfuric acid and 5 mL of hydrochloric acid. Dilute with water to 50 mL.

Standard stock solution A: Dissolve 1.60 g of lead nitrate in diluted nitric acid (10 mL of nitric acid diluted with 20 mL water, boiled to remove nitrous fumes, and cooled), and dilute with water to 1000 mL.

Standard stock solution B: *Standard stock solution A* and water (1:50). [NOTE—This solution contains the equivalent of 20 μ g/mL of lead.]

Standard solutions: To a series of 100-mL volumetric flasks pipet 0, 1, 2, 3, 4, and 5 mL of *Standard stock solution B*, and dilute with water to about 50 mL. Add 8 mL of sulfuric acid and 10 mL of hydrochloric acid to each flask, shake to dissolve, and dilute with water to volume. [NOTE—These solutions contain 0, 0.2, 0.4, 0.6, 0.8, and 1.0 μ g/mL of lead, respectively.]

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Atomic absorption

Analytical wavelength: 283.3 nm

Analysis

Samples: *Standard solutions* and *Sample solution*
Concomitantly determine the absorbances of the *Standard solutions* and the *Sample solution*. Plot the absorbances of the *Standard solutions* versus the concentration of lead. Using this graph, determine the concentration of lead in the *Sample solution*.

Acceptance criteria: NMT 1 ppm

SPECIFIC TESTS• **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>:

It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*. The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g.

• **MELTING RANGE OR TEMPERATURE**, *Class I* <741>: 133°–144°• **OPTICAL ROTATION**, *Specific Rotation* <781>: –4° to –7°

Tartaric Acid

C₄H₆O₆

150.09

Butanedioic acid, 2,3-dihydroxy-;

Butanedioic acid, 2,3-dihydroxy-, [*R*-(*R**,*R**)]-;

Tartaric acid; L-(+)-Tartaric acid [526-83-0; 87-69-4].

DEFINITION

Tartaric Acid, dried over phosphorus pentoxide for 3 h, contains NLT 99.7% and NMT 100.5% of C₄H₆O₆.

IDENTIFICATION• **A. IDENTIFICATION TESTS—GENERAL**, *Tartrate* <191>: It meets the requirements.• **B. INFRARED ABSORPTION** <197K>**ASSAY**• **PROCEDURE**

Sample: 2 g of Tartaric Acid, previously dried, in a conical flask

Analysis: Dissolve the *Sample* in 40 mL of water, add phenolphthalein TS, and titrate with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 75.04 mg of C₄H₆O₆.

Acceptance criteria: 99.7%–100.5%

IMPURITIES**Inorganic Impurities**• **RESIDUE ON IGNITION** <281>: NMT 0.1%• **CHLORIDE AND SULFATE**, *Sulfate* <221>

Sample solution: 10 mL of a 1-in-100 solution of Tartaric Acid

Analysis: Add to the *Sample solution* 3 drops of hydrochloric acid and 1 mL of barium chloride TS.

Acceptance criteria: No turbidity is produced.

• **HEAVY METALS**, *Method II* <231>: NMT 10 ppm**SPECIFIC TESTS**• **OPTICAL ROTATION**, *Specific Rotation* <781S>: +12.0° to +13.0°

- Sample solution:** 200 mg/mL in water
- **LOSS ON DRYING** (731): Dry over phosphorus pentoxide for 3 h; it loses NMT 0.5% of its weight.
 - **LIMIT OF OXALATE**
Sample solution: 10 mL of a 1-in-10 solution of Tartaric Acid
Analysis: Nearly neutralize the *Sample solution* with 6 N ammonium hydroxide, and add 10 mL of calcium sulfate TS.
Acceptance criteria: No turbidity is produced.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
 USP Tartaric Acid RS

Thimerosal—see *Thimerosal General Monographs***Thymol**

$C_{10}H_{14}O$ 150.22
 Phenol, 5-methyl-2-(1-methylethyl)-;
 Thymol;
p-Cymen-3-ol [89-83-8].

DEFINITION

Thymol contains NLT 99.0% and NMT 101.0% of thymol ($C_{10}H_{14}O$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** It meets the requirements in *Specific Tests for Melting Range or Temperature* (741).

ASSAY• **PROCEDURE**

Sample: 100 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N bromine VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 250-mL iodine flask, and dissolve in 25 mL of 1 N sodium hydroxide. Add 20 mL of hot dilute hydrochloric acid (1 in 2), and immediately titrate with *Titrant* to within 1–2 mL of the calculated endpoint. Warm the solution to between 70° and 80°, add 2 drops of methyl orange TS, and continue the titration slowly, swirling vigorously after each addition. When the color of the methyl orange is bleached, add 2 drops of *Titrant*, shake for 10 s, add 1 drop of methyl orange TS, and shake vigorously. If the solution is red, continue the titration, dropwise and with shaking, until the color is discharged. Repeat the alternate addition of the *Titrant* and methyl orange TS until the red color is discharged after the addition of the methyl orange TS. Each mL of *Titrant* is equivalent to 3.755 mg of thymol ($C_{10}H_{14}O$).

Acceptance criteria: 99.0%–101.0%

IMPURITIES• **LIMIT OF NONVOLATILE RESIDUE**

Sample: 2 g

Analysis: Volatilize the *Sample* on a steam bath, and dry at 105° to constant weight.

Acceptance criteria: NMT 0.05%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 48°–51°; but when melted, Thymol remains liquid at a considerably lower temperature.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
 USP Thymol RS

Titanium Dioxide—see *Titanium Dioxide General Monographs***Tocopherols Excipient****DEFINITION**

Tocopherols Excipient is a vegetable oil solution containing NLT 50.0% of total tocopherols, of which NLT 80.0% consists of varying amounts of beta, gamma, and delta tocopherols.

IDENTIFICATION

- **A.**
Sample solution: 50 mg of Tocopherols Excipient in 10 mL of dehydrated alcohol
Analysis: To the *Sample solution* add with swirling 2 mL of nitric acid, and heat at about 75° for 15 min.
Acceptance criteria: A bright red or orange color develops.
- **B.** The retention time of the third major peak (i.e., the peak occurring just before that of the internal standard) of the *Sample solution* corresponds to that of the *Standard solution*, both relative to that of the internal standard, as obtained in the Assay.

ASSAY• **PROCEDURE**

Solution A: Pyridine and propionic anhydride (2:1)

Internal standard solution: 3 mg/mL of hexadecyl hexadecanoate in *Solution A*

Standard solutions: Using low-actinic glassware, add 12-, 25-, 37-, and 50-mg portions of USP Alpha Tocopherol RS to separate 50-mL conical flasks having 19/38 standard-taper ground-glass necks. Pipet 25 mL of the *Internal standard solution* into each flask, and reflux for 10 min under water-cooled condensers.

Sample solution: Using low-actinic glassware, add 60 mg of Tocopherols Excipient to a 50-mL conical flask similar to the flasks used in preparing the *Standard solutions*. Add 10.0 mL of *Internal standard solution*, and reflux for 10 min under a water-cooled condenser.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 4-mm × 2-m borosilicate glass; packed with 2%–5% liquid phase G2 on 80- to 100-mesh support S1AB using either a glass-lined sample introduction system or on-column injection

Temperatures

Column: 245°–265°, maintained isothermally

Injection port: 10° higher than the *Column* temperature

Detector: 10° higher than the *Column* temperature

Flow rate: Dry carrier gas is adjusted to obtain a hexadecyl hexadecanoate peak 30–32 min after sample introduction. [NOTE—Cure and condition the column as necessary.]

Injection volume: 2–5 μ L

System suitability

Sample: *Sample solution*

[NOTE—The relative retention times for delta tocopheryl propionate, beta plus gamma tocopheryl propionate, and hexadecyl hexadecanoate are about 0.50, 0.63, and 1.00, respectively.]

Suitability requirements

Resolution: Chromatograph a sufficient number of injections to ensure that a resolution of NLT 2.5 between delta tocopheryl propionate and beta plus gamma tocopheryl propionate relative to hexadecyl hexadecanoate is met.

Analysis

Samples: *Standard solutions* and *Sample solution*

Calibration: Chromatograph each *Standard solution*, and calculate the relative response factor, *F*, for each concentration of the *Standard solution* taken:

$$F = (r_s/r_D) \times (C_D/C_s)$$

r_s = peak response of alpha tocopherol in the *Standard solution*

r_D = peak response of hexadecyl hexadecanoate in the *Standard solution*

C_D = concentration of hexadecyl hexadecanoate in the *Standard solution* (mg/mL)

C_s = concentration of USP Alpha Tocopherol RS in the *Standard solution* (mg/mL)

Chromatograph a sufficient number of injections of each *Standard solution* to ensure that *F* is constant within a range of 2.0%. Prepare a relative response factor curve by plotting *F* versus the alpha tocopheryl propionate peak response.

Inject the *Sample solution*, and measure the responses for the four major peaks occurring at relative retention times of approximately 0.50, 0.63, 0.76, and 1.00, and record the values as a_{δ} , $a_{\beta/\gamma}$, a_{α} , and a_D , corresponding to delta tocopheryl propionate, beta plus gamma tocopheryl propionates, alpha tocopheryl propionate, and hexadecyl hexadecanoate, respectively.

Calculate the quantity of each tocopherol form in the Tocopherols Excipient taken:

$$\text{delta tocopherol} = (V \times C_D/F) \times (a_{\delta}/a_D)$$

$$\text{beta plus gamma tocopherols} = (V \times C_D/F) \times (a_{\beta/\gamma}/a_D)$$

$$\text{alpha tocopherol} = (V \times C_D/F) \times (a_{\alpha}/a_D)$$

V = volume of *Internal standard solution* used in the *Sample solution* (mL)

F = obtained from the relative response factor curve (see *Calibration*) for each of the corresponding responses for the delta, beta plus gamma, and alpha tocopheryl propionate peaks produced by the *Sample solution*

[NOTE—The relative response factor for delta tocopheryl propionate and for beta plus gamma tocopheryl propionates has been determined empirically to be the same as for alpha tocopheryl propionate.]

Acceptance criteria: NLT 50.0% of total tocopherols, of which NLT 80.0% consists of varying amounts of beta, gamma, and delta tocopherols

SPECIFIC TESTS• **ACIDITY**

Solution A: Alcohol and ether (50%:50%). Neutralize to phenolphthalein with 0.1 N sodium hydroxide.

Sample solution: Dissolve 1.0 g of Tocopherols Excipient in 25 mL of *Solution A*.

Analysis: To the *Sample solution* add 0.5 mL of phenolphthalein TS, and titrate with 0.10 N sodium hydroxide until the solution remains faintly pink after being shaken for 30 s.

Acceptance criteria: NMT 1.0 mL of 0.10 N sodium hydroxide is required.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Protect with a blanket of an inert gas.
- **LABELING:** Label it to indicate the content, in mg/g, of total tocopherols and of the sum of beta, gamma, and delta tocopherols.
- **USP REFERENCE STANDARDS** <11>
USP Alpha Tocopherol RS

Tolu Balsam Syrup**DEFINITION**

Prepare Tolu Balsam Syrup as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Tolu Balsam Tincture	50 mL
Magnesium Carbonate	10 g
Sucrose	820 g
Purified Water, a sufficient quantity to make	1000 mL

Add the *Tincture* all at once to the *Magnesium Carbonate* and 60 g of the *Sucrose* in a mortar, and mix. Gradually add 430 mL of *Purified Water* with trituration, and filter. Dissolve the remainder of the *Sucrose* in the clear filtrate with gentle heating, strain the syrup while warm, and add sufficient *Purified Water* through the strainer to make the product measure 1000 mL, and mix.

Tolu Balsam Syrup may also be prepared as follows. Place 760 g of the *Sucrose* in a suitable percolator, the neck of which is nearly filled with loosely packed cotton, moistened after packing with a few drops of water. Pour the filtrate, obtained as directed in the preceding instructions, on the *Sucrose*, and regulate the outflow to a steady drip of percolate. When all of the liquid has run through, return portions of the percolate, if necessary, to dissolve all the *Sucrose*. Then pass enough *Purified Water* through the cotton to make the product measure 1000 mL, and mix.

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method II** <611>: 3.0%–5.0%

SPECIFIC TESTS

- **FATS AND FIXED OILS, Acid Value** <401>

Sample solution: 2% of solution

Analysis: Add phenolphthalein TS, and titrate with 0.5 N alcoholic potassium hydroxide VS.

Acceptance criteria: 112–168

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers, and store at controlled room temperature.

- **LABELING:** The label states the Latin binomial name and, following the official name, the part of the plant source from which the article was derived.

Tolu Balsam Tincture

DEFINITION

Tolu Balsam Tincture is prepared from Tolu Balsam obtained from *Myroxylon balsamum* (L.) Harms var. *balsamum* (Fam. Fabaceae).

Prepare Tolu Balsam Tincture as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Tolu Balsam	200 g
Alcohol	750 mL
Alcohol, a sufficient quantity to make	1000 mL

Macerate the *Tolu Balsam* with 750 mL of *Alcohol* in a container that can be closed, and put in a warm place. Agitate it frequently during 3 days or until the soluble matter is dissolved. Transfer the mixture to a filter, and when most of the liquid has drained away, wash the residue on the filter with a sufficient quantity of *Alcohol*, combining the filtrates to produce 1000 mL of Tincture, and mix.

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I** <611>: 77.0%–83.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers, and store at controlled room temperature. Avoid exposure to direct sunlight and to excessive heat.
- **LABELING:** The label states the Latin binomial name and, following the official name, the part of the plant source from which the article was derived.

Tragacanth

DEFINITION

Tragacanth is the dried gummy exudation from *Astragalus gummifer* Labillardière, or other Asiatic species of *Astragalus* (Fam. Leguminosae).

IDENTIFICATION

- **A.** Add 1 g to 50 mL of water: it swells and forms a smooth, nearly uniform, stiff, opalescent mucilage free from cellular fragments.

IMPURITIES

- **LEAD** <251>: NMT 10 ppm
- **HEAVY METALS, Method II** <231>: NMT 20 ppm

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: It meets the requirements for absence of *Salmonella* species and *Escherichia coli*.

BOTANIC CHARACTERISTICS

Tragacanth: It is flattened, lamellated, frequently curved fragments or straight or spirally twisted linear pieces from 0.5 to 2.5 mm in thickness. It is white to weak yellow in color, translucent, and horny in texture. Its fracture is short. It is rendered more easily pulverizable by heating to 50°. It is odorless.

Histology: Pieces of Tragacanth softened in water and mounted in water or glycerin show numerous lamellae and a few starch grains.

Powdered tragacanth: It is white to yellowish white. When examined in water mounts, it shows numerous

angular fragments of mucilage with circular or irregular lamellae, and occasional starch grains up to 25 µm in diameter, mostly simple, spherical to elliptical, with occasional two- to four-compound grains, a few of the grains being swollen and more or less altered. The powder shows few or no fragments of lignified vegetable tissue (Indian gum).

KARAYA GUM

Sample solution: 1 g in 20 mL of water

Analysis: Boil the *Sample solution* until a mucilage is formed, add 5 mL of hydrochloric acid, and again boil the mixture for 5 min.

Acceptance criteria: No pink or red color develops.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Trehalose

$C_{12}H_{22}O_{11}$ 342.30

$C_{12}H_{22}O_{11} \cdot 2H_2O$ 378.33

Anhydrous [99-20-7].

Dihydrate [6138-23-4].

DEFINITION

Trehalose is a stable, nonreducing disaccharide with two glucose molecules linked in an α,α -1,1 configuration. It is obtained through enzymatic conversion of food-grade starch. It contains NLT 97.0% and NMT 102.0% of $C_{12}H_{22}O_{11}$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>

B.

Sample solution: 400 mg/mL of Trehalose

Analysis: Add 0.4 mL of a solution containing 1-naphthol in 95% alcohol (1 in 20) to 1 mL of the *Sample solution*. Gently add 2 mL of sulfuric acid to the solution.

Acceptance criteria: A violet color develops at the interface between the two solutions.

C.

Glycine solution: 40 mg/mL of Glycine

Sample solution: 40 mg/mL of Trehalose

Analysis: Add 1 mL of diluted hydrochloric acid to 2 mL of the *Sample solution*. Allow to stand for 20 min at room temperature. Add 4 mL of sodium hydroxide TS and 2 mL of the *Glycine solution* to the *Sample solution*. Heat the solution for 10 min in boiling water.

Acceptance criteria: A brown color does not develop.

ASSAY

PROCEDURE

Mobile phase: Water

Standard solution: 10 mg/mL of USP Trehalose RS, calculated on the anhydrous basis

Sample solution: 10 mg/mL of Trehalose, calculated on the anhydrous basis

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC
Detector: Refractive index
Column: 8-mm × 30-cm; packing L58
Temperature
Detector: 40°
Column: 80°
Flow rate: Adjust so that the retention time of trehalose is about 15 min.
Injection size: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
 Calculate the percentage of trehalose (C₁₂H₂₂O₁₁) in the portion of Trehalose taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the *Sample solution*
 r_S = peak response of the *Standard solution*
 C_S = concentration of USP Trehalose RS in the *Standard solution* (mg/mL)
 C_U = concentration of Trehalose in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%, determined on 2.0 g of Trehalose
- **HEAVY METALS, Method I** (231)
Sample: 4.0 g
Monitor preparation: Prepare with 2.5 mL of *Standard Lead Solution*.
Acceptance criteria: NMT 5 ppm
- **RELATED SUBSTANCES**
Mobile phase and Chromatographic system: Prepare as directed in the Assay.
Sample solution: 10 mg/mL of Trehalose
Standard solution: 0.1 mg/mL of *Sample solution*
System suitability solution: Dissolve 2.5 mL of *Sample solution*, 25 mg of maltotriose, and 25 mg of glucose, and dilute with water to 10.0 mL.
System suitability
Sample: *System suitability solution*
 [NOTE—The relative retention times for maltotriose, trehalose, and glucose are about 0.9, 1.0, and 1.2, respectively.]
Suitability requirements
Resolution: NLT 1.5 between trehalose and maltotriose
Relative standard deviation: NMT 2.0% for the trehalose peak

Analysis

Samples: *Sample solution* and *Standard solution*
 Determine the peak areas for all peaks.
Acceptance criteria: For the *Sample solution*, the areas of any peaks corresponding to maltotriose and other polysaccharides and eluting before trehalose are NMT half of the area of the peak corresponding to trehalose in the chromatogram of the *Standard solution* (0.5%). The areas of any peaks corresponding to glucose and eluting after trehalose are NMT half of the area of the peak corresponding to trehalose in the chromatogram of the *Standard solution* (0.5%).

SPECIFIC TESTS

- **COLOR AND CLARITY OF SOLUTION**
Sample solution: 33 g of Trehalose in 67 g of recently boiled water
Analysis: Using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)), measure the absorbances of the *Sample solution* at 420 and 720

nm in a 10-cm cuvette. The absorbance of the *Sample solution* at 720 nm is NMT 0.050.
 Determine the absorbance difference:

$$\text{Result} = A_{420} - A_{720}$$

A_{420} = absorbance of the *Sample solution* at 420 nm
 A_{720} = absorbance of the *Sample solution* at 720 nm
Acceptance criteria: The absorbance difference is NMT 0.100.

- **OPTICAL ROTATION, Specific Rotation** (781S): +197° to +201° at 20°
Sample solution: 100 mg/mL
- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count is NMT 100 cfu/g, and the total combined molds and yeasts count is NMT 100 cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **pH** (791)
Sample solution: 100 mg/mL
Acceptance criteria: 4.5–6.5
- **WATER DETERMINATION, Method I** (921): For the anhydrous form, NMT 1.0%; for the dihydrate form, 9.0%–11.0%
Sample: 0.1 g
- **BACTERIAL ENDOTOXINS TEST** (85): If labeled for use in preparing parenteral dosage forms, it also meets the following requirements. The level of bacterial endotoxins is such that the requirement in the relevant dosage form monograph(s) in which Trehalose is used can be met. Where the label states that Trehalose must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirement in the relevant dosage form monograph(s) in which Trehalose is used can be met.
- **CHLORIDE AND SULFATE, Chloride** (221): A 2.0-g sample shows no more chloride than corresponds to 0.70 mL of 0.01 M hydrochloric acid (NMT 0.0125%).
- **CHLORIDE AND SULFATE, Sulfate** (221): A 2.0-g sample shows no more sulfate than corresponds to 0.83 mL of 0.005 M sulfuric acid (NMT 0.0200%).
- **NITROGEN CONTENT, Method I** (461)
Sample: 5.0 g
Analysis: Proceed as directed for *Method I*, increasing the sulfuric acid used for digestion to 30 mL and reducing the sodium hydroxide solution (2 in 5) to 45 mL.
Acceptance criteria: NMT 0.005%
- **SOLUBLE STARCH**
Sample solution: 10% Trehalose (w/v)
Analysis: Add several drops of iodine TS to the *Sample solution*.
Acceptance criteria: No blue color develops.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.
- **LABELING:** Where Trehalose is intended for use in the manufacture of injectable dosage forms, it is so labeled. Where Trehalose must be subjected to further processing during the preparation of injectable dosage forms to ensure acceptable levels of bacterial endotoxins, it is so labeled.
- **USP REFERENCE STANDARDS** (11)
 USP Endotoxin RS
 USP Glycerin RS
 USP Trehalose RS

Triacetin—see *Triacetin General Monographs*

Tributyl Citrate

C₁₈H₃₂O₇

360.44

DEFINITION

Tributyl Citrate contains NLT 99.0% of tributyl citrate (C₁₈H₃₂O₇), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *System suitability solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

System suitability solution: 30 mg/mL each of USP Tributyl Citrate RS and USP Acetyltributyl Citrate RS in toluene

Sample solution: 30 mg/mL of Tributyl Citrate in toluene

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC, equipped with an on-column, temperature-programmable injector

Detector: Flame ionization

Column: 0.32-mm × 30-m, bonded with a 0.5-μm layer of phase G42

Temperatures

Injector: See *Table 1*.

Detector: 275°

Column: See *Table 2*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
85	—	85	0.5
85	20	225	10

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
80	—	80	0.5
80	20	220	10

Carrier gas: Helium

Flow rate: 2.3 mL/min

Injection volume: 1 μL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for tributyl citrate and acetyltributyl citrate are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between tributyl citrate and acetyltributyl citrate

Relative standard deviation: NMT 2.0%, determined from both the tributyl citrate and acetyltributyl citrate peaks

Analysis

Sample: *Sample solution*

Calculate the percentage of tributyl citrate (C₁₈H₃₂O₇) in the portion of sample taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of tributyl citrate from the *Sample solution*

r_T = sum of all peaks excluding the solvent peak

Acceptance criteria: NLT 99.0% on the anhydrous basis

IMPURITIES

- **HEAVY METALS**, *Method II* <231>: NMT 10 μg/g

SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>: 1.037–1.045

- **REFRACTIVE INDEX** <831>: 1.443–1.445

• ACIDITY

Sample: 32.0 g

Analysis: Dissolve the *Sample* in 30 mL of isopropyl alcohol, previously neutralized to bromothymol blue. Add bromothymol blue TS, and titrate with 0.10 N sodium hydroxide to a faint blue endpoint.

Acceptance criteria: NMT 1.0 mL of 0.10 N sodium hydroxide is required.

- **WATER DETERMINATION**, *Method I* <921>: NMT 0.2%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS** <11>

USP Acetyltributyl Citrate RS

USP Tributyl Citrate RS

Trichloromonofluoromethane

CCl₃F

137.37

Methane, trichlorofluoro-

Trichlorofluoromethane [75-69-4].

DEFINITION

Trichloromonofluoromethane contains NLT 99.6% and NMT 100.0% of trichloromonofluoromethane (CCl₃F), calculated on the anhydrous basis.

IDENTIFICATION

- **A.** The IR absorption spectrum, determined in a 10-cm cell with sodium chloride windows, at atmospheric pressure, exhibits maxima, among others, at the following wavelengths, in μm: 4.67 (m), 5.95 (m), 7.28 (s), 8.06 (m), 9.2 (vs), 10.7 (vs), 11.8 (vs), and 13.4 (m). The stronger maxima are best obtained at pressures less than 10 mm of mercury.

ASSAY

• PROCEDURE

System suitability solution: Introduce a liquid-phase mixture of dichlorodifluoromethane, dichlorotetrafluoroethane, and trichloromonofluoromethane into an evacuated headspace vial.

Sample solution: Introduce the liquid phase of Trichloromonofluoromethane into an evacuated headspace vial.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: GC
 Detector: Flame ionization
 Column: 2-mm × 1.8-m stainless steel; 1% phase G25 on support S12
 Temperatures
 Injection port: 110°
 Detector: 200°
 Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	10	170	5

Carrier gas: Helium

Flow rate: 20 mL/min

Headspace sampler: The bath temperature is 100°, the valve/loop temperature is 105°, and the sampling time is 3 s. Make adjustments as necessary to optimize peak areas to record trace-level impurities.

System suitability

Sample: Gas phase headspace of the *System suitability solution*

[NOTE—The relative retention times for dichlorodifluoromethane, dichlorotetrafluoroethane, and trichloromonofluoromethane are 0.5, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between dichlorotetrafluoroethane and trichloromonofluoromethane

Analysis

Sample: Gas phase headspace of the *Sample solution*
 Calculate the percentage of trichloromonofluoromethane (CCl₃F) in the portion of Trichloromonofluoromethane taken.

Acceptance criteria: 99.6%–100.0% on the anhydrous basis

IMPURITIES

• INORGANIC CHLORIDES

Sample: 7 g

Analysis: Place 5 mL of anhydrous methanol in a test tube, add 3 drops of a saturated solution of silver nitrate in anhydrous methanol, shake, and add the *Sample*.

Acceptance criteria: No opalescence or turbidity is produced.

• CHROMATOGRAPHIC PURITY

Analysis: In the chromatogram from the *Assay*, identify the dichlorodifluoromethane and dichlorotetrafluoroethane peaks from relative retention times of those peaks in the chromatogram of the *System suitability solution*.

Acceptance criteria

Sum of the peak areas for dichlorodifluoromethane and dichlorotetrafluoroethane: NMT 0.2% of the total of all peak areas

Sum of the areas of all peaks other than that for trichloromonofluoromethane: NMT 0.4% of the total of all peak areas.

SPECIFIC TESTS

• BOILING TEMPERATURE

Analysis: Determine as directed in *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601), *Approximate Boiling Temperature*.

Acceptance criteria: Approximately 24°

• WATER

Analysis: Determine as directed in *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601), *Water Content, and Water Determination, Method Ic* (921).

Acceptance criteria: NMT 0.001%

• HIGH-BOILING RESIDUES

Analysis: Determine as directed in *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601), *High-Boiling Residues, Method I*.

Acceptance criteria: NMT 0.01%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight cylinders, and avoid exposure to excessive heat.

Triethyl Citrate

C₁₂H₂₀O₇

276.28

DEFINITION

Triethyl Citrate contains NLT 99.0% and NMT 100.5% of C₁₂H₂₀O₇, calculated on the anhydrous basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197F)

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of a similar preparation of USP Triethyl Citrate RS, as obtained in the *Assay*.

ASSAY

• PROCEDURE

System suitability solution: 30 mg/mL each of USP Triethyl Citrate RS and USP Acetyltriethyl Citrate RS in toluene

Sample solution: 30 mg/mL of Triethyl Citrate in toluene

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m; 0.5-μm layer of phase G42

USP Acetyltriethyl Citrate RS

USP Triethyl Citrate RS

Medium-Chain Triglycerides

Glycerides, mixed decanoyl and octanoyl; Caprylic and capric triglycerides.

DEFINITION

Medium-Chain Triglycerides consist of a mixture of triglycerides of saturated fatty acids, mainly of caprylic acid ($C_8H_{16}O_2$) and capric acid ($C_{10}H_{20}O_2$). The fatty acids are derived from the oil extracted from the hard, dried fraction of the endosperm of *Cocos nucifera* L. or from the dried endosperm of *Elaeis guineensis* Jacq. They contain NLT 95% of saturated fatty acids with 8 and 10 carbon atoms.

IDENTIFICATION

- **A.** Meet the requirements in *Specific Tests for Fats and Fixed Oils, Saponification Value* (401)
- **B.** Meet the requirements in *Specific Tests for Fats and Fixed Oils, Fatty Acid Composition* (401)

IMPURITIES

- **HEAVY METALS**, *Method II* (231)

[NOTE—Use this test for Medium-Chain Triglycerides intended for use other than in parenteral nutrition.]

Sample solution: Transfer 2.0 g of Medium-Chain Triglycerides to a quartz crucible. Add 0.5 g of magnesium oxide. Ignite the crucible to dull redness until a homogeneous white or grayish-white mass is obtained. Ignite at 800° for 1 h, cool, and dissolve the residue by adding two 5-mL portions of diluted hydrochloric acid. Add 0.1 mL of phenolphthalein TS and then ammonium hy-

droxide until a pink color is obtained. Cool, add glacial acetic acid until the solution is decolorized, then add 0.5 mL in excess, and dilute with water to 20.0 mL.

Standard solution: To 0.5 g of magnesium oxide add 2.0 mL of *Lead Standard Solution*, and evaporate to dryness at 105° for 1 h. Using the same conditions as prescribed for the *Sample solution*, ignite, dissolve in diluted hydrochloric acid, add ammonia and then acetic acid, and dilute with water to 20.0 mL.

Analysis: To 12 mL of the *Sample solution* add 2.0 mL of pH 3.5 *Acetate Buffer* and 1.2 mL of thioacetamide–glycerin base TS. To 10 mL of the *Standard solution* add 2.0 mL of the *Sample solution*, and add 2.0 mL of pH 3.5 *Acetate Buffer* and 1.2 mL of thioacetamide–glycerin base TS. Prepare a blank, using a mixture of 10 mL of water and 2.0 mL of the *Sample solution*. Compared to the blank, the *Standard solution* shows a light brown color. Dilute both the *Sample solution* and the *Standard solution* with water to 50 mL, allow to stand for 2 min, and view downward over a white surface.

Acceptance criteria: NMT 10 µg/g; any brown color of the *Sample solution* is not darker than that of the *Standard solution*.

- **LIMIT OF CHROMIUM**

[NOTE—Use this test for Medium-Chain Triglycerides intended for use in parenteral nutrition.]

Sample stock solution: 500 mg/mL of Medium-Chain Triglycerides in diisobutyl ketone

Sample solution: 200 mg/mL of Medium-Chain Triglycerides in diisobutyl ketone, from *Sample stock solution*

Chromium standard stock solution: 0.283 mg/mL of potassium dichromate in water, using potassium dichromate previously dried at 105° for 4 h

Chromium standard solution: Immediately before use, prepare 0.283 µg/mL of potassium dichromate in water, from the *Chromium standard stock solution*. This solution contains the equivalent of 0.1 µg/mL of chromium.

Standard solutions: Into each of three 10-mL volumetric flasks, transfer 4.0 mL of *Sample stock solution*, add 0.5, 1.0, and 2.0 mL, respectively, of *Chromium standard solution*, and dilute with diisobutyl ketone to volume. These solutions contain 0.005, 0.01, and 0.02 µg/mL of chromium.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a graphite furnace

Analytical wavelength: 357.8 nm

Lamp: Chromium hollow-cathode

Carrier gas: Argon

Analysis

Samples: *Standard solutions* and *Sample solution*
Determine the absorbances of the *Standard solutions* and the *Sample solution* in triplicate, and determine the average of the steady readings for each. Plot the average absorbances of the *Standard solutions* and the *Sample solution* versus the concentration of added chromium. Draw the straight line best fitting the points, and extrapolate the line until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of chromium in the *Sample solution*.

Acceptance criteria: NMT 0.05 µg/g

- **LIMIT OF COPPER**

[NOTE—Use this test for Medium-Chain Triglycerides intended for use in parenteral nutrition.]

Sample stock solution and Sample solution: Proceed as directed in the test for *Limit of Chromium*.

Copper standard stock solution: 0.393 mg/mL of cupric sulfate in water

Copper standard solution: Immediately before use, prepare 0.393 µg/mL of cupric sulfate in water, from the *Copper standard stock solution*. This solution contains the equivalent of 0.1 µg/mL of copper.

Standard solutions: Into each of three 10-mL volumetric flasks, transfer 4.0 mL of *Sample stock solution*. Add 1.0, 2.0, and 4.0 mL, respectively, of *Copper standard solution*, and dilute with diisobutyl ketone to volume. These solutions contain 0.01, 0.02, and 0.04 µg/mL of copper.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a graphite furnace

Analytical wavelength: 324.7 nm

Lamp: Copper hollow-cathode

Carrier gas: Argon

Analysis

Samples: *Standard solutions* and the *Sample solution*
Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution* in triplicate. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the concentration of added copper. Draw the straight line best fitting the points, and extrapolate the line until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of copper in the *Sample solution*.

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT OF LEAD**

[NOTE—Use this test for Medium-Chain Triglycerides intended for use in parenteral nutrition.]

Sample stock solution and Sample solution: Proceed as directed in the test for *Limit of Chromium*.

Lead standard stock solution: Dissolve 160 mg of lead nitrate in 100 mL of water that contains 1 mL of lead-free nitric acid, and dilute with water to 1000 mL. Pipet 10 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume.

Lead standard solution: Immediately before use, prepare 0.16 µg/mL of lead nitrate from the *Lead standard stock solution*. This solution contains the equivalent of 0.1 µg/mL of lead.

Standard solutions: Into each of three 10-mL volumetric flasks, transfer 4.0 mL of *Sample stock solution*. Add 1.0, 2.0, and 4.0 mL, respectively, of *Lead standard solution*, and dilute with diisobutyl ketone to volume. These solutions contain 0.01, 0.02, and 0.04 µg/mL of lead.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a graphite furnace coated inside with palladium carbide

[NOTE—Calcination is carried out in the presence of oxygen at a temperature below 800°.]

Analytical wavelength: 283.3 nm

Lamp: Lead hollow-cathode

Carrier gas: Argon

Analysis

Samples: *Standard solutions* and the *Sample solution*
Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution* in triplicate. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the concentration of added lead. Draw the straight line best fitting the points, and extrapolate the line until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of lead in the *Sample solution*.

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT OF NICKEL**

[NOTE—Use this test for Medium-Chain Triglycerides intended for use in parenteral nutrition.]

Sample stock solution and Sample solution: Proceed as directed in the test for *Limit of Chromium*.

Nickel standard solution: Immediately before use, dilute 10 mL of nickel standard solution TS with water to 1000 mL. This solution contains the equivalent of 0.1 µg/g of nickel.

Standard solutions: Into each of three 10-mL volumetric flasks, transfer 4.0 mL of *Sample stock solution*. Add 1.0, 2.0, and 4.0 mL, respectively, of *Nickel standard solution*, and dilute with diisobutyl ketone to volume. These solutions contain 0.01, 0.02, and 0.04 µg/mL of nickel.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a graphite furnace

Analytical wavelength: 232 nm

Lamp: Nickel hollow cathode

Carrier gas: Argon

Analysis

Samples: *Standard solutions* and the *Sample solution*
Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution* in triplicate. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the concentration of added nickel. Draw the straight line best fitting the points, and extrapolate the line until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution*.

Acceptance criteria: NMT 0.1 µg/g

• **LIMIT OF TIN**

[NOTE—Use this test for Medium-Chain Triglycerides intended for use in parenteral nutrition.]

Sample stock solution and Sample solution: Proceed as directed in the test for *Limit of Chromium*.

Tin standard stock solution: Dissolve 500 mg of metallic tin (Sn) in a mixture of 5 mL of water and 25 mL of hydrochloric acid, and dilute with water to 1000 mL.

Tin standard solution: Immediately before use, dilute 10 mL of *Tin standard stock solution* with dilute hydrochloric acid (2.5 in 100) to 1000 mL, and then dilute 10 mL of the solution with water to 500 mL. This solution contains the equivalent of 0.1 µg/g of tin.

Standard solutions: Into each of three 10-mL volumetric flasks, transfer 4.0 mL of *Sample stock solution*. Add 1.0, 2.0, and 4.0 mL, respectively, of *Tin standard solution*, and dilute with diisobutyl ketone to volume. These solutions contain 0.01, 0.02, and 0.04 µg/mL of tin.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometer equipped with a graphite furnace coated inside with palladium carbide

Analytical wavelength: 286.3 nm

Lamp: Tin hollow-cathode

Carrier gas: Argon

Analysis

Samples: *Standard solutions* and the *Sample solution*
Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution* in triplicate. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the concentration of added tin. Draw the straight line best fitting the points, and extrapolate the line until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of tin in the *Sample solution*.

Acceptance criteria: NMT 0.1 µg/g

• **ALKALINE IMPURITIES**

Sample solution: Dissolve 2.0 g of Medium-Chain Triglycerides in a mixture of alcohol and ethyl ether (1.5: 3.0).

Analysis: Add 0.05 mL of bromophenol blue TS to the *Sample solution*, and titrate with 0.01 N hydrochloric acid to a yellow endpoint.

Acceptance criteria: NMT 0.15 mL of 0.01 N hydrochloric acid is required.

SPECIFIC TESTS

- **FATS AND FIXED OILS, Unsaponifiable Matter** <401>
Sample: 5.0 g
Acceptance criteria: NMT 0.5%
- **SPECIFIC GRAVITY** <841>: 0.93–0.96 at 20°
- **WATER, Method I** <921>: NMT 0.2%
- **APPEARANCE**
Diluent: Hydrochloric acid and water (2.75%: 97.25%)
Sample: 10 mL
Standard solution: Prepare immediately before use by mixing 2.4 mL of ferric chloride CS and 0.6 mL of cobaltous chloride CS with *Diluent* to make 10.0 mL, and diluting 5.0 mL of the solution with *Diluent* to make 10.0 mL.
Analysis: Compare the *Sample* and the *Standard solution* by viewing them downward in matched color-comparison tubes against a white surface (see *Color and Achromicity* <631>).
Acceptance criteria: The *Sample* is clear and not more intensely colored than the *Standard solution*.
- **FATS AND FIXED OILS, Acid Value (Free Fatty Acids)** <401>: NMT 0.2
- **FATS AND FIXED OILS, Fatty Acid Composition** <401>: The fatty acid fraction of Medium-Chain Triglycerides exhibits the following composition as seen in *Table 1*. Disregard any peak with an area less than 0.05% of the total area.

Table 1

Carbon-Chain Length	Number of Double Bonds	Percentage (%)
6	0	≤2.0
8	0	50.0–80.0
10	0	20.0–50.0
12	0	≤3.0
14	0	≤1.0

- **FATS AND FIXED OILS, Hydroxyl Value** <401>: NMT 10
- **FATS AND FIXED OILS, Iodine Value** <401>: NMT 1.0
- **FATS AND FIXED OILS, Peroxide Value** <401>: NMT 1.0
- **FATS AND FIXED OILS, Saponification Value** <401>
Sample: 1.0 g
Acceptance criteria: 310–360
- **VISCOSITY—CAPILLARY VISCOMETER METHODS** <911>
Analysis: Determine at 20 ± 0.1° with a capillary viscometer.
Acceptance criteria: 25–33 centipoises
- **REFRACTIVE INDEX** <831>: 1.440–1.452 at 20°
- **ARTICLES OF BOTANICAL ORIGIN, Total Ash** <561>
Sample: 2.0 g
Acceptance criteria: NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at temperatures not exceeding 25°.
- **LABELING:** Where it is intended for use in parenteral nutrition, it is so labeled.

Trolamine

C₆H₁₅NO₃ 149.19
Ethanol, 2,2',2''-nitrilotris-;
2,2',2''-Nitrilotriethanol [102-71-6].

DEFINITION

Trolamine is a mixture of alkanolamines consisting largely of triethanolamine [N(C₂H₄OH)₃] containing some diethanolamine [NH(C₂H₄OH)₂] and monoethanolamine [NH₂(C₂H₄OH)]. It contains NLT 99.0% and NMT 107.4%

of alkanolamines, calculated on the anhydrous basis as N(C₂H₄OH)₃.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197F>
- **B.**
Analysis 1: To 1 mL add 0.1 mL of cupric sulfate TS.
Acceptance criteria 1: A deep blue color is produced.
Analysis 2: Add 5 mL of 1 N sodium hydroxide, and concentrate to one-third of the original volume by boiling.
Acceptance criteria 2: The blue color remains.
- **C.**
Analysis: To 1 mL add 0.3 mL of cobaltous chloride TS.
Acceptance criteria: A carmine red color is produced.

ASSAY

- **PROCEDURE**
Sample: 2 g of Trolamine
Analysis: Transfer the *Sample* to a 300-mL conical flask. Add 75 mL of water and 2 drops of methyl red TS, and titrate with 1 N hydrochloric acid VS. Each mL of 1 N hydrochloric acid is equivalent to 149.2 mg of triethanolamine, expressed as N(C₂H₄OH)₃.
Acceptance criteria: 99.0%–107.4% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.05%

SPECIFIC TESTS

- **SPECIFIC GRAVITY** <841>: 1.120–1.128
- **REFRACTIVE INDEX** <831>: 1.481–1.486 at 20°
- **WATER DETERMINATION, Method I** <921>: NMT 0.5%, using a mixture of glacial acetic acid and methanol (1:4) as the solvent

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** <11>
USP Trolamine RS

Tromethamine—see *Tromethamine General Monographs*

Tyloxapol—see *Tyloxapol General Monographs*

Vanilla**DEFINITION**

Vanilla is the cured, full-grown, unripe fruit of *Vanilla planifolia* Andrews, often known in commerce as Mexican, Bourbon, or Madagascar vanilla, or of *Vanilla tahitensis* J. W. Moore, known in commerce as Tahitian vanilla (Fam. Orchidaceae). Vanilla yields NLT 12.0% of anhydrous, diluted alcohol-soluble extractive.

ASSAY

- **CONTENT OF ANHYDROUS, DILUTED ALCOHOL-SOLUBLE EXTRACTIVE**

Sample: 2 g of Vanilla

Analysis: Place the *Sample*, finely cut or coarsely powdered and accurately weighed, in a suitable flask. Add 70 mL of diluted alcohol, shake by mechanical means for 2 h or for 8 h at 30-min intervals, and allow to stand overnight. Decant the liquid into a filter, and

wash the flask and residue with small portions of diluted alcohol, passing the washings through the filter until the filtrate measures 100.0 mL. Mix the filtrate well, evaporate a 50.0-mL portion in a suitable tared container on a steam bath to dryness, and dry the residue at 105° for 4 h. The weight obtained represents the yield of anhydrous, diluted alcohol-soluble extractive from one-half of the portion of Vanilla taken. Calculate the yield for the entire *Sample* taken.

Acceptance criteria: NLT 12.0%

SPECIFIC TESTS

BOTANIC CHARACTERISTICS

Unground Vanilla

Macroscopic: Linear, flattened capsules of 12–35 cm in length and 5–9 mm in width, with an apex terminating in a flat, circular scar and a gradually tapering base that is more or less curved or hooked; or in Tahitian vanilla, broad in the middle and tapering toward either end, the base closely resembling the summit. It is flexible and tough, nearly black, dusky brown to moderate brown externally, longitudinally wrinkled, moist, glossy, and occasionally has efflorescence of acicular or prismatic crystals of vanillin. Internally it is unilocular, with a brownish-black pulp and numerous minute seeds. Occasional capsules are split near the summit into three parts.

Microscopic: The epidermis has a distinct cuticle and occasional stomata. The epidermal cells contain red to brown bodies and occasional prisms of calcium oxalate or crystals of vanillin. It has a collenchyma layer of one or two rows of cells, a thick sarcocarp composed of parenchyma and an interrupted circle of fibrovascular bundles, the latter leptocentric with a few vessels, and an outer circle of fibers with thin, strongly lignified walls and numerous transverse simple pits. The vessels with walls have slit-like pits or spiral thickenings; the parenchyma cells are usually thin-walled and deeply undulate, some thick-walled with oblique, slit-like pits or broad spiral bands, and contain occasional bundles of acicular crystals of calcium oxalate, up to 400 µm in length, or a thin protoplasmic layer enclosing numerous oil globules. It has an endocarp composed of placental and interplacental regions; the placental region consists of six bifid placentas extending into the cavity of the fruit and bears irregularly trianguloid, black to reddish, flattened seeds, up to about 250 µm in diameter, having a deeply reticulate seed coat; the interplacental regions show long, nearly straight hairs more or less matted together by their gummy, resinous secretion.

Powdered Vanilla

Macroscopic: Dusky brown to nearly black

Microscopic: The principal elements of identification are fragments of parenchyma of the sarcocarp with long, oblique, slit-like walls or broad spiral bands, calcium oxalate crystals of acicular outline and up to 400 µm in length, and monoclinic prisms up to 35 µm in length. It has numerous unicellular, nearly straight, glandular hairs, fragments of the seed coat with polygonal stone cells, and slender crystals of vanillin.

TEST FOR VANILLIN

Analysis: Place a few of the crystals, occurring as an efflorescence on the fruit, on a microslide or watch glass, and add 1 drop of phloroglucinol TS and 1 drop of hydrochloric acid.

Acceptance criteria: The solution immediately acquires a red color.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store in a cold place.
- **LABELING:** The label states the Latin binomial and, following the official name, the part of the plant contained in

the article. The commercial variety of Vanilla, whether Mexican, Bourbon, Madagascar, or Tahitian, is also stated on the label. The label states that Vanilla that has become brittle is not to be used.

Vanilla Tincture

DEFINITION

Prepare Vanilla Tincture as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Vanilla, cut into small pieces	100 g
Purified Water	200 mL
Alcohol	207 mL
Sucrose, in coarse granules	200 g
Diluted Alcohol, a sufficient quantity to make	1000 mL

Add *Purified Water* to the comminuted *Vanilla* in a suitable covered container, and macerate for 12 h, preferably in a warm place. Add *Alcohol* to the mixture, mix, and macerate for about 3 days. Transfer the mixture to a percolator containing *Sucrose*, and drain. Pack the drug firmly, and percolate slowly, using *Diluted Alcohol* as the menstruum.

OTHER COMPONENTS

- **ALCOHOL DETERMINATION, Method I (611):** 38.0%–42.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers, and avoid exposure to direct sunlight and excessive heat.
- **LABELING:** The label states the Latin binomial name and, following the official name, the part of the plant source from which the article was derived.

Vanillin

C₈H₈O₃
Benzaldehyde, 4-hydroxy-3-methoxy-;
Vanillin [121-33-5].

152.15

DEFINITION

Vanillin contains NLT 97.0% and NMT 103.0% of vanillin (C₈H₈O₃), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B. ULTRAVIOLET ABSORPTION (197U)**
Sample solution: 8 µg/mL in methanol
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**
Standard solution: 8 µg/mL of USP Vanillin RS in methanol
Sample solution: 8 µg/mL of Vanillin in methanol
Blank: Methanol
Instrumental conditions
(See *Spectrophotometry and Light-Scattering* (851).)

Mode: UV

Analytical wavelength: 308 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Calculate the percentage of vanillin ($C_8H_8O_3$) in the portion of Vanillin taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Vanillin RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.05%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 81°–83°
- **LOSS ON DRYING** (731): Dry the sample over silica gel for 4 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Vanillin RS

Hydrogenated Vegetable Oil

DEFINITION

Hydrogenated Vegetable Oil is a mixture of triglycerides of fatty acids. The melting range, heavy metals limit, iodine value, and saponification value differ, depending on Type, as described in the table below.

	Type I	Type II
Melting Range or Temperature (741), <i>Class II</i>	57°–85°	20°–50°
Heavy Metals (231), <i>Method II</i>	0.001%	0.001%
Fats and Fixed Oils (401), <i>Iodine Value, Method II</i>	0–5	55–80
Fats and Fixed Oils (401), <i>Saponification Value</i>	175–200	175–200

SPECIFIC TESTS

- **LOSS ON DRYING** (731)
Analysis: Dry a sample at 105° for 4 h.
Acceptance criteria: NMT 0.1%
- **FATS AND FIXED OILS, Acid Value** (401)
Sample: 20 g in a conical flask
Analysis: Melt the *Sample* on a steam bath, add 100 mL of hot alcohol previously neutralized with 0.1 N sodium hydroxide to phenolphthalein TS, swirl, and add 1 mL of phenolphthalein TS. Titrate with 0.10 N sodium hydroxide until the solution remains faintly pink after being shaken for 15 s.
Acceptance criteria: NMT 4.0
- **FATS AND FIXED OILS, Unsaponifiable Matter** (401): NMT 0.8%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, in a cool place.
- **LABELING:** Label it to state whether it is Type I or Type II.

Vitamin E Polyethylene Glycol Succinate

DEFINITION

Vitamin E Polyethylene Glycol Succinate is a mixture formed by the esterification of *d*-alpha tocopheryl acid succinate and polyethylene glycol. The ester mixture consists primarily of mono-esterified polyethylene glycol and a small amount of di-esterified polyethylene glycol. It contains NLT 25.0% of *d*-alpha tocopherol ($C_{29}H_{50}O_2$).

IDENTIFICATION

• A. GAS CHROMATOGRAPHIC IDENTIFICATION TEST

Analysis: Proceed as directed in the test for *Content of Alpha Tocopherol*.

Acceptance criteria: The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*.

COMPOSITION

• CONTENT OF ALPHA TOCOPHEROL

Solvent: 0.25 mL of phenolphthalein TS in 1 L of alcohol

Internal standard solution: 12 mg/mL of ethyl arachidate in isooctane

Standard solution: Transfer 32.5 mg of USP Alpha Tocopherol RS to a suitable reaction flask. Add 2 mL of pyridine and 0.5 mL of *N,O*-bis(trimethylsilyl)trifluoroacetamide with 1% trimethylchlorosilane, and heat the flask at 100° for 10 min. Cool the flask, add 5.0 mL of *Internal standard solution* followed by 20 mL of isooctane, and shake.

Sample solution: Transfer a quantity equivalent to 0.100–0.160 g of Vitamin E Polyethylene Glycol Succinate molten at 60° to a culture tube (about 20 cm long and 2.5 cm in diameter) equipped with a screw cap. Add 40–50 mg of ascorbic acid and a few boiling chips, followed by 20 mL of *Solvent*. [NOTE—Reflux the solution gently without emission of contents.] Place the tube in a heating block set at 100°–150°. When the sample is fully dissolved, add 0.25 g of potassium hydroxide, and continue to reflux for 30 min. Remove the tube from heat, and while contents are still hot, add 1–2 mL of hydrochloric acid dropwise until the pink coloration disappears. [CAUTION—Exothermic reaction. Allow the acid to trickle down the inside of the tube to prevent splashing.] Cool the tube, then wash the sides of the tube with 20 mL of water. Add 5.0 mL of *Internal standard solution*, cap, and shake to ensure thorough mixing. Allow the tube to stand until two distinct layers are formed. Transfer 2.5–3.5 mL of the upper layer into a suitable reaction flask, and add 2.0 mL of pyridine followed by 2.5 mL of *N,O*-bis(trimethylsilyl)trifluoroacetamide with 1% trimethylchlorosilane. Heat the flask at 100° for 10 min. Cool, and then add 12 mL of isooctane.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 15-m fused-silica capillary; coated with a 0.25- μm film of phase G27

Temperature

Injector: 280°

Detector: 345°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
260	20	340	1

Carrier gas: Helium
Flow rate: 1.5 mL/min
Injection size: 1 μ L
Injection type: Split ratio, 200:1

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for the alpha tocopherol peak

Relative standard deviation: NMT 2.0% for the ratio of the alpha tocopherol peak area to the internal standard peak area

Analysis

Samples: *Standard solution* and *Sample Solution*

Calculate the percentage of *d*-alpha tocopherol ($C_{29}H_{50}O_2$) in the portion of Vitamin E Polyethylene Glycol Succinate taken:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U) \times 100$$

R_U = internal standard ratio (peak area of alpha tocopherol/peak area of the internal standard) from the *Sample solution*

R_S = internal standard ratio (peak area of alpha tocopherol/peak area of the internal standard) from the *Standard solution*

W_S = weight of USP Alpha Tocopherol RS used to prepare the *Standard solution* (mg)

W_U = weight of Vitamin E Polyethylene Glycol Succinate taken to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 25.0%

SPECIFIC TESTS

• **OPTICAL ROTATION, Specific Rotation (781S)**

[NOTE—This test identifies *d*-alpha tocopherol after saponification.]

Sample solution: Transfer 0.9 g of Vitamin E Polyethylene Glycol Succinate, molten at 60°, to a suitable test tube fitted with a cap, and dissolve in 10.0 mL of alcohol. Place the tube in a heating block set at 100°–105°. [NOTE—Reflux the solution gently without emission of contents.] When the sample is fully dissolved, add 2–3 pellets of sodium hydroxide, and continue to reflux for an additional 30 min. Remove the tube from the heat, and while contents are still hot, neutralize using phenolphthalein as the indicator by slowly adding 10 mL of a mixture of water and hydrochloric acid (1:1) until the pink color disappears.

[**CAUTION**—Exothermic reaction. Allow the acid solution to trickle down the inside of the tube to prevent splashing.] Cool the tube, cap, and shake until contents are well mixed. Add 25.0 mL of heptane, cap, and shake for 1 min to ensure thorough mixing. Allow the tube to stand until two distinct layers are formed.

Transfer the top layer to a clean, dry culture tube, then add 10.0 mL of water to the recovered solution. Cap, shake, and allow the layers to separate. Transfer the upper layer to a clean, dry tube. Add 10.0 mL of potassium ferricyanide solution, prepared by dissolving 2 g of potassium ferricyanide in 10.0 mL of 0.2 M sodium hydroxide, and replace the cap. Shake vigorously for 45 s, and allow the layers to separate for 30 min. If the top heptane layer is clear, proceed with the measurement for specific rotation; if not clear, dry over anhydrous sodium sulfate before proceeding with the test. [NOTE—Use the results of the test for *Content of Alpha Tocopherol* to calculate the specific rotation.]

Acceptance criteria: NLT +24.0°

• **SOLUBILITY IN WATER**

Sample: 20 g of melted Vitamin E Polyethylene Glycol Succinate

Analysis: Place the *Sample* in a glass container on a magnetic stirrer. Immediately add 80 mL of boiling

water while stirring. Allow to cool to room temperature with constant stirring.

Acceptance criteria: The solution becomes clear within 3 h.

• **ACID VALUE**

Sample: 1 g of Vitamin E Polyethylene Glycol Succinate

Analysis: Dissolve the *Sample* in 25 mL of a mixture of alcohol and ether (1:1) that has been neutralized to phenolphthalein with 0.1 N sodium hydroxide. Add 0.5 mL of phenolphthalein TS, and titrate with 0.10 N sodium hydroxide until the solution remains faintly pink after shaking for 30 s.

Acceptance criteria: NMT 0.027 mEq/g, equivalent to NMT 0.27 mL of 0.10 N sodium hydroxide

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store protected from light.
- **LABELING:** The labeling indicates the *d*-alpha tocopherol content, expressed in mg/g.
- **USP REFERENCE STANDARDS** (11)
USP Alpha Tocopherol RS

Water for Injection—see *Water for Injection General Monographs*

Water for Injection, Sterile—see *Sterile Water for Injection General Monographs*

Water for Irrigation, Sterile—see *Sterile Water for Irrigation General Monographs*

Water, Purified—see *Purified Water General Monographs*

Carnauba Wax

DEFINITION

Carnauba Wax is obtained from the leaves of *Copernicia cerifera* Mart. (Fam. Palmae).

IMPURITIES

• **RESIDUE ON IGNITION** (281)

Sample: 2 g

Analysis: Heat the *Sample* in an open porcelain or platinum dish over a flame: it volatilizes without emitting an acrid odor. Ignite.

Acceptance criteria: The weight of the residue is NMT 5 mg, corresponding to NMT 0.25%.

• **HEAVY METALS, Method II** (231): 20 ppm

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE, Class II** (741): 80°–86°

• **ACID VALUE**

Sample: 3 g

Analysis: Weigh the *Sample* into a 250-mL flask attached to a reflux condenser. Add 50 mL of a mixture of isopropyl alcohol and toluene (5:4), and boil gently until the wax is completely dissolved. Remove the flask from the condenser, add 1 mL of phenolphthalein TS, and immediately titrate with 0.5 N alcoholic potassium

hydroxide VS to a faint, reddish-yellow color. [NOTE—Do not allow the solution to cool. Titrate at warm temperature after refluxing.]

Calculate the acid value as the number of mg of potassium hydroxide required to neutralize the free acids in 1 g of Carnuba Wax.

Acceptance criteria: 2–7

• **FATS AND FIXED OILS, Saponification Value (401)**

Sample: Use the solution from the test for *Acid Value*.

Analysis: To the *Sample* add 15.0 mL of 0.5 N alcoholic potassium hydroxide VS, reflux for 3 h, and titrate the excess alkali with 0.5 N hydrochloric acid VS to a yellow-amber color. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*).

Calculate the ester value. The saponification value is the sum of the ester value and the acid value.

Acceptance criteria: 78–95

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Emulsifying Wax

DEFINITION

Emulsifying Wax is a waxy solid prepared from Cetostearyl Alcohol containing a polyoxyethylene derivative of a fatty acid ester of sorbitan.

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE (741)**

Sample: Emulsifying Wax

Analysis: Melt a quantity of the *Sample* slowly, while stirring, until it reaches a temperature of 90°–92°. Remove the source of the heat, and allow the molten substance to cool to a temperature of 8°–10° above the expected melting point. Chill the bulb of a suitable thermometer (see *Thermometers* (21)) to 5°, wipe it dry, and while it is still cold, dip it into the molten substance so that the bulb is completely covered. Withdraw it immediately, and hold it vertically away from the heat until the surface dulls. Fix the thermometer securely in a test tube so that the lower point is 15 mm from the bottom of the test tube. Place the test tube in a water bath at 10°–15°, and allow it to remain at that temperature for 30 min. Raise the temperature of the bath at the rate of 2°/min to 30°, then change to a rate of 1°/min, and note the temperature at which the first drop of melted substance leaves the thermometer. Repeat the determination twice on a freshly melted portion of the sample substance. If the variation of three determinations is less than 1°, take the average of the three as the melting point. Otherwise, make two additional determinations, and take the average of the five.

Acceptance criteria: 50°–54°

• **FATS AND FIXED OILS, Hydroxyl Value (401):** 178–192

• **FATS AND FIXED OILS, Iodine Value (401):** NMT 3.5

• **FATS AND FIXED OILS, Saponification Value (401):** NMT 14

• **pH (791)**

Sample dispersion: Heat 3 g of Emulsifying Wax in 100 mL of water to 55°, with stirring, followed by cooling to 25°.

Acceptance criteria: 5.5–7.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Microcrystalline Wax

DEFINITION

Microcrystalline Wax is a mixture of straight-chain, branched-chain, and cyclic hydrocarbons, obtained by solvent fractionation of the still bottom fraction of petroleum by suitable dewaxing or deoiling means.

IMPURITIES

• **RESIDUE ON IGNITION (281)**

Sample: 2 g

Analysis: Heat the *Sample* in an open porcelain or platinum dish over a flame.

Acceptance criteria: It volatilizes without emitting an acrid odor and on ignition yields NMT 0.1%.

SPECIFIC TESTS

• **COLOR**

Standard solution: Mix 3.8 mL of ferric chloride CS and 1.2 mL of cobaltous chloride CS in a clear-glass, 16- × 150-mm bacteriological test tube.

Sample solution: Melt 10 g of Microcrystalline Wax on a steam bath, and pour 5 mL of the liquid into a clear-glass, 16- × 150-mm bacteriological test tube.

Analysis: Visually compare the contents of both tubes in reflected light against a white background, holding the tubes directly against the background at such an angle that there is no fluorescence.

Acceptance criteria: The *Sample solution* is not darker than the *Standard solution*.

• **MELTING RANGE OR TEMPERATURE, Class III (741):** 54°–102°

• **CONSISTENCY**

Sample: Microcrystalline Wax

Apparatus: Determine the consistency of the *Sample* by means of a penetrometer fitted with a polished metal needle weighing 2.5 ± 0.05 g and having a truncated symmetric tapered angle of $9^{\circ}0' \pm 15'$. The needle is tapered, with a length of 25.4 mm, and the shaft attached to the needle is 58 mm in length and 3.17 mm in diameter. The plunger that fits into the penetrometer and guides the path of the needle weighs 47.5 ± 0.05 g. An additional weight of 50 ± 0.05 g is added to the top of the plunger to give a total load of 100 g.

Analysis: The *Sample* is cast in a brass cylinder open at both ends. The cylinder has an inside diameter of 25.4 mm and is 31.8 mm in height. Place the cylinder on a brass plate wetted with an equal volume mixture of glycerin and water, and place the plate on two corks. Pour the wax, melted at approximately 17° above its congealing point, into the cylinder. Continue pouring the wax until a convex meniscus is formed above the cylinder. Allow the specimen to cool for 1 h at approximately 24°. Shave excess wax from the top of the cylinder, and remove the plate. With the smooth wax surface in the up position, condition the specimen in a water bath at 25° for 1 h.

Arrange the penetrometer so that the wax specimen is completely immersed in the water bath while penetration is run. Lower the needle until the tip just touches the top surface of the specimen. Release the needle for 5 s, and read the depth of penetration in tenths of millimeters. Perform four determinations, and calculate the average value of the four readings.

Acceptance criteria: 3–100 (0.3–10.0 mm)

• **ORGANIC ACIDS**

Sample solution: 20 g of Microcrystalline Wax in 100 mL of a mixture of neutralized alcohol and water (1:2). Agitate thoroughly, and heat to boiling.

Analysis: To the *Sample solution* add 1 mL of phenolphthalein TS, and titrate rapidly with 0.1 N sodium hydroxide VS, with vigorous agitation, to a sharp pink endpoint in the alcohol-water layer.

Acceptance criteria: NMT 0.4 mL of 0.1 N sodium hydroxide is required.

- **FIXED OILS, FATS, AND ROSIN**

Sample: 10 g

Sample solution: Digest the *Sample* with 50 mL of sodium hydroxide solution (1 in 5) at 100° for 30 min. Separate the water layer, and acidify it with 2 N sulfuric acid.

Acceptance criteria: No oily or solid matter separates.

- **ALKALINITY**

Sample: 35 g

Analysis: Introduce the *Sample* into a 250-mL separator, add 100 mL of boiling water, and shake vigorously for 5 min. Draw off the separated water into a casserole, wash further with two 50-mL portions of boiling water, and add the washings to the casserole. To the pooled washings add 1 drop of phenolphthalein TS, and boil.

Acceptance criteria: The solution does not acquire a pink color.

- **ACIDITY**

Analysis: If the addition of phenolphthalein TS in the test for *Alkalinity* produces no pink color, add 0.1 mL of methyl orange TS.

Acceptance criteria: No red or pink color is produced.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label it to indicate the name and proportion of any added stabilizer.

White Wax

DEFINITION

White Wax is the product of bleaching and purifying Yellow Wax that is obtained from the honeycomb of the bee [*Apis mellifera* L. (Fam. Apidae)] and that meets the requirements of the *Saponification Cloud Test*.

SPECIFIC TESTS

- **SAPONIFICATION CLOUD TEST**

Sample: 3.00 g

Alcoholic potassium hydroxide: Dissolve 40 g of potassium hydroxide in about 900 mL of aldehyde-free alcohol maintained at a temperature not exceeding 15°, and then when solution is complete, warm to room temperature, and add aldehyde-free alcohol to make 1000 mL.

Analysis: Place the *Sample* in a 100-mL round-bottom boiling flask fitted with a ground-glass joint. Add 30 mL of *Alcoholic potassium hydroxide*. Reflux the mixture gently for 2 h. At the end of this period, open the flask, insert a thermometer into the solution, and place the flask in a container of water at a temperature of 80°. Rotate the flask in the bath while both the bath and the solution cool.

Acceptance criteria: The solution shows no cloudiness or globule formation before the temperature reaches 65°.

- **MELTING RANGE OR TEMPERATURE, Class II (741):** 62°–65°

- **FATS OR FATTY ACIDS, JAPAN WAX, ROSIN, and SOAP**

Sample: 1 g

Analysis 1: Boil the *Sample* for 30 min with 35 mL of 3.5 N sodium hydroxide contained in a 100-mL beaker, maintaining the volume of solution by the occasional addition of water, and allow the mixture to cool at room temperature for about 2 h.

Acceptance criteria 1: The wax separates, leaving the liquid clear, turbid, or translucent, but not opaque.

Analysis 2: Filter the cool mixture obtained in *Analysis 1*, and acidify the clear filtrate with hydrochloric acid.

Acceptance criteria 2: The liquid remains clear or shows NMT a slight amount of turbidity or precipitate.

- **FATS AND FIXED OILS, Acid Value (401)**

Sample: 3 g

Analysis: Warm the *Sample* in a 200-mL flask with 25 mL of neutralized dehydrated alcohol until melted, then shake the mixture. Add 1 mL of phenolphthalein TS, and titrate the warm liquid with 0.5 N alcoholic potassium hydroxide VS to produce a permanent, faint pink color. Calculate the acid value as directed in the chapter.

Acceptance criteria: 17–24

- **FATS AND FIXED OILS, Ester Value (401)**

Sample solution: The solution resulting from the determination of *Acid Value*

Analysis: To the *Sample solution* add 25.0 mL of 0.5 N alcoholic potassium hydroxide VS and 50 mL of aldehyde-free alcohol, and reflux the mixture for 4 h. Titrate the excess alkali with 0.5 N hydrochloric acid VS. Perform a blank determination (see *Titrimetry (541)*, *Residual Titrations*). Calculate the ester value as directed in the chapter.

Acceptance criteria: 72–79

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Yellow Wax

DEFINITION

Yellow Wax is the purified wax from the honeycomb of the bee [*Apis mellifera* L. (Fam. Apidae)]. The crude beeswax used to prepare Yellow Wax conforms to the *Saponification Cloud Test*.

SPECIFIC TESTS

- **SAPONIFICATION CLOUD TEST**

Sample: 3.00 g

Alcoholic potassium hydroxide: Dissolve 40 g of potassium hydroxide in about 900 mL of aldehyde-free alcohol maintained at a temperature not exceeding 15°, and then when solution is complete, warm to room temperature, and add aldehyde-free alcohol to make 1000 mL.

Analysis: Place the *Sample* in a 100-mL round-bottom boiling flask fitted with a ground-glass joint. Add 30 mL of *Alcoholic potassium hydroxide*. Reflux the mixture gently for 2 h. At the end of this period, open the flask, insert a thermometer into the solution, and place the flask in a container of water at a temperature of 80°. Rotate the flask in the bath while both the bath and the solution cool.

Acceptance criteria: The solution shows no cloudiness or globule formation before the temperature reaches 65°.

- **MELTING RANGE OR TEMPERATURE, Class II (741):** 62°–65°

- **FATS OR FATTY ACIDS, JAPAN WAX, ROSIN, and SOAP**

Sample: 1 g

Analysis 1: Boil the *Sample* for 30 min with 35 mL of 3.5 N sodium hydroxide contained in a 100-mL beaker, maintaining the volume of solution by the occasional addition of water, and allow the mixture to cool at room temperature for about 2 h.

Acceptance criteria 1: The wax separates, leaving the liquid clear, turbid, or translucent, but not opaque.

Analysis 2: Filter the cool mixture obtained in *Analysis 1*, and acidify the clear filtrate with hydrochloric acid.

Acceptance criteria 2: The liquid remains clear or shows NMT a slight amount of turbidity or precipitate.

- **FATS AND FIXED OILS, Acid Value (Free Fatty Acids) (401)**

Sample: 3 g

Analysis: Warm the *Sample* in a 200-mL flask with 25 mL of neutralized dehydrated alcohol until melted,

then shake the mixture. Add 1 mL of phenolphthalein TS, and titrate the warm liquid with 0.5 N alcoholic potassium hydroxide VS to produce a permanent, faint pink color. Calculate the *Acid Value* as directed in the chapter.

Acceptance criteria: 17–24

• **FATS AND FIXED OILS, *Ester Value* (401)**

Sample solution: The solution resulting from the determination of *Acid Value*

Analysis: To the *Sample solution* add 25.0 mL of 0.5 N alcoholic potassium hydroxide VS and 50 mL of aldehyde-free alcohol, and reflux the mixture for 4 h. Titrate the excess alkali with 0.5 N hydrochloric acid VS. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*). Calculate the *Ester Value* as directed in the chapter.

Acceptance criteria: 72–79

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Xanthan Gum

DEFINITION

Xanthan Gum is a high molecular weight polysaccharide gum produced by a pure-culture fermentation of a carbohydrate with *Xanthomonas campestris*, then purified by recovery with Isopropyl Alcohol, dried, and milled. It contains D-glucose and D-mannose as the dominant hexose units, along with D-glucuronic acid, and is prepared as the sodium, potassium, or calcium salt. It yields NLT 4.2% and NMT 5.0% of carbon dioxide, calculated on the dried basis, corresponding to NLT 91.0% and NMT 108.0% of Xanthan Gum.

IDENTIFICATION

• **A.**

Sample: Prepare a dry blend of 1.5 g of Xanthan Gum and 1.5 g of locust bean gum.

Control: 3.0 g of Xanthan Gum

Analysis

Samples: *Sample* and *Control*

To two separate 400-mL beakers add 300 mL of water, and heat to 80°. Stir rapidly by mechanical means. Add the *Sample* to one of the beakers and the *Control* to the other beaker at the point of maximum agitation. Stir until the mixtures dissolve, and then continue stirring for 30 min longer. Do not allow the temperature of the mixtures to drop below 60° during the stirring. Discontinue stirring, and allow the mixtures to cool at room temperature for NLT 2 h.

Acceptance criteria: A firm, rubbery gel forms with the *Sample* after the temperature drops below 40°, but no such gel forms with the *Control*.

ASSAY

• **PROCEDURE**

Sample: 1.2 g

Analysis: Proceed as directed in *Alginates Assay* (311).

Acceptance criteria: 4.2%–5.0% of carbon dioxide on the dried basis, corresponding to 91.0%–108.0% of Xanthan Gum

IMPURITIES

- **ARSENIC, *Method II* (211):** NMT 3 µg/g

- **LEAD (251)**

Sample: Prepare a *Test Preparation* as directed in the chapter

Control: Use 5 mL of *Diluted Standard Lead Solution* (5 µg of Pb).

Analysis: Proceed as directed in the chapter.

Acceptance criteria: NMT 5 µg/g

- **HEAVY METALS, *Method II* (231):** NMT 30 µg/g. Use a platinum crucible for the ignition.

- **LIMIT OF ISOPROPYL ALCOHOL**

Internal standard solution: 1 mg/mL of tertiary butyl alcohol

Standard stock solution: 1 mg/mL of isopropyl alcohol

Standard solution: Pipet 4 mL of the *Standard stock solution* and 4 mL of the *Internal standard solution* into a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: Disperse 1 mL of a suitable antifoam emulsion in 200 mL of water contained in a 1000-mL, round-bottom distilling flask having a 24/40 standard taper ground joint. Add 5 g of Xanthan Gum, and shake for 1 h on a wrist-action mechanical shaker. Connect the flask to a fractionating column, and distill 100 mL, adjusting the heat so that foam does not enter the column. Add by pipet 4 mL of the *Internal standard solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 3.2-mm × 1.8-m stainless steel column packed with 80- to 100-mesh surface-silanized packing S3, or equivalent

Temperatures

Column: 165°

Detector: 200°

Injection port: 200°

Carrier gas: Helium

Injection volume: 4–5 µL

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—The retention time of tertiary butyl alcohol is 1.5 relative to that of isopropyl alcohol.]

Calculate the percentage of isopropyl alcohol in the portion of Xanthan Gum taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of isopropyl alcohol to tertiary butyl alcohol from the *Sample solution*

R_S = peak response ratio of isopropyl alcohol to tertiary butyl alcohol from the *Standard solution*

C_S = concentration of isopropyl alcohol in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.075%

- **PYRUVIC ACID**

Solution A: 5 mg/mL of 2,4-dinitrophenylhydrazine in 2 N hydrochloric acid

Standard stock solution: 90 µg/mL of pyruvic acid

Standard solution: Transfer 10.0 mL of the *Standard stock solution* to a glass-stoppered, 50-mL flask. Add 20.0 mL of 1 N hydrochloric acid, weigh the flask, and reflux for 3 h, taking precautions to prevent loss of vapors. Cool, and add water to make up for any weight loss during refluxing. Transfer 2.0 mL of this solution to a 30-mL separator containing 1.0 mL of *Solution A*. Mix, and allow to stand for 5 min. Extract the mixture with 5 mL of ethyl acetate, and discard the aqueous layer. Extract the hydrazone from the ethyl acetate with three 5-mL portions of sodium carbonate TS, collect the extracts in a 50-mL volumetric flask, and dilute with sodium carbonate TS to volume.

Sample stock solution: 6 mg/mL of Xanthan Gum

Sample solution: Transfer 10.0 mL of the *Sample stock solution* to a glass-stoppered, 50-mL flask. Proceed as directed in the *Standard solution*, beginning with "Add 20.0 mL of 1 N hydrochloric acid..."

Blank: Sodium carbonate TS

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: Spectrophotometry

Analytical wavelength: 375 nm

Cell: 1 cm

Analysis

Samples: Standard solution, Sample solution, and Blank

Acceptance criteria: The absorbance of the Sample solution is NLT that of the Standard solution, corresponding to NLT 1.5% of pyruvic acid.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: It meets the requirements of the tests for *Salmonella* species and *Escherichia coli*.

- **LOSS ON DRYING** <731>

Analysis: Dry at 105° for 2.5 h.

Acceptance criteria: NMT 15.0%

- **ASH**

Sample: Weigh 3 g in a tared crucible.

Analysis: Incinerate the Sample at 650° until free from carbon. Cool the crucible and its contents in a desiccator, and weigh.

Acceptance criteria: The weight of the ash is between 6.5%–16.0%, calculated on the dried basis.

- **ROTATIONAL RHEOMETER METHODS** <912>

Sample: Prepare a dry blend of 3.0 g of Xanthan Gum and 3.0 g of potassium chloride.

Instrumental conditions

Instrument: Rotational viscometer

Spindle cylinder dimensions

Diameter: 1.27 cm

Height: 0.16 cm

Shaft diameter: 0.32 cm

Distance from top of cylinder to lower lip of shaft: 2.54 cm

Immersion depth: 5.00 cm (No. 3 spindle)

Spindle rotation speed: 60 rpm

Analysis: To a 400-mL beaker add 250 mL of water. Add the Sample slowly while stirring at 800 rpm, using a low-pitched, propeller-type stirrer. Add 44 mL of water, rinsing the walls of the beaker. Approximately 10 min after the addition of the Sample to the water, remove the beaker from the propeller-type stirrer, and vigorously stir the solution by hand to ensure that all the particles around the edge of the beaker are in solution. Return the beaker to the stirrer, and agitate at 800 rpm for a total mixing time of 2 h. Adjust the temperature to $24 \pm 1^\circ$, and stir by hand in a vertical motion to eliminate any thixotropic effects or layering. Each hand mixing should be NMT 15–30 s, and the last hand mixing should occur immediately before measuring the viscosity. With the spindle rotating at 60 rpm, immediately observe and record the scale reading. Convert the scale readings to centipoises by multiplying the readings by the constant for the viscometer spindle and speed used.

Acceptance criteria: NLT 600 centipoises at 24°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Xanthan Gum Solution

DEFINITION

Prepare Xanthan Gum Solution of the designated percentage strength as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Xanthan Gum (for a 0.1% solution)	100 mg
Xanthan Gum (for 1.0% solution)	1.0 g
Methylparaben	100 mg
Propylparaben	20 mg
Purified Water, a sufficient quantity to make	100 mL

Dissolve a weighed quantity of Propylparaben in Purified Water with heating to 50° and stirring. Cool, and dilute quantitatively, and stepwise if necessary, with Purified Water to obtain 90 mL of solution containing 20 mg of Propylparaben. Heat to 50°, and add the Methylparaben, with stirring, to dissolve. Cool, stir with a blender, slowly sift the Xanthan Gum into the vortex, and continue to blend for 2 min after the Xanthan Gum has been added. Add 10 mL of Purified Water, and blend for 5 min. Allow to stand for 1 h for excess foam to subside, and remove most of the remaining foam by passing the solution through a strainer. Add Purified Water, if necessary, to make the final volume 100 mL, and stir. [NOTE—Depending on the volume needed and the equipment available, adjust the formula proportionately.]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.
- **LABELING:** Label it to state, as part of the official title, the percentage content of Xanthan Gum.
- **BEYOND-USE DATE:** Six weeks after the day on which it was compounded

Xylitol

C₅H₁₂O₅
Xylitol.

152.15

DEFINITION

Xylitol contains NLT 98.5% and NMT 101.0% of C₅H₁₂O₅, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>

Sample: Undried

- **B.** The retention time of the xylitol peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

ASSAY

- **PROCEDURE**

Mobile phase: Acetonitrile and water (20:80)

System suitability solution: 2.5 mg/mL of USP Galactitol RS and 25 mg/mL of USP Xylitol RS in Mobile phase

Standard solution: 25 mg/mL of USP Xylitol RS in Mobile phase

Sample solution: 25 mg/mL of Xylitol in Mobile phase

Chromatographic system

(See *Chromatography* <621>, System Suitability.)

Mode: LC

Detector: UV 192 nm

Column: 8.0-mm × 30-cm; 7-μm packing L34

Column temperature: 80°

Flow rate: 0.5 mL/min

Injection size: 25 μL

System suitability

Sample: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for xylitol and galactitol are about 1.0 and 1.10, respectively.]

Suitability requirements

Resolution: NLT 2.0 between galactitol and xylitol, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of xylitol (C₅H₁₂O₅) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of xylitol from the *Sample solution*

r_S = peak response of xylitol from the *Standard solution*

C_S = concentration of USP Xylitol RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 98.5%–101.0% on the anhydrous basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.5%

• **HEAVY METALS** (231): NMT 10 ppm, using 2 g of Xylitol dissolved in 25 mL of water

• REDUCING SUGARS

Sample: 500 mg

Analysis: Dissolve the *Sample* in 2.0 mL of water in a 10-mL conical flask. Into a similar flask, pipet 2 mL of a 0.5 mg/mL dextrose solution. To each flask add 1 mL of alkaline cupric tartrate TS, heat to boiling, and cool.

Acceptance criteria: Any turbidity in the xylitol flask is NMT that in the dextrose flask, in which a reddish-brown precipitate forms (0.2% reducing sugars, as dextrose).

• LIMIT OF OTHER POLYOLS

Mobile phase: Acetonitrile and water (20:80)

System suitability solution: 0.5 mg/mL each of USP L-Arabinitol RS, USP Galactitol RS, USP Mannitol RS, and USP Sorbitol RS, and 100 mg/mL of USP Xylitol RS in *Mobile phase*

Standard solution: 0.5 mg/mL each of USP L-Arabinitol RS, USP Galactitol RS, USP Mannitol RS, and USP Sorbitol RS in *Mobile phase*

Sample solution: 100 mg/mL of Xylitol in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 192 nm

Column: 8.0-mm × 30-cm; 7-μm packing L34

Column temperature: 80°

Flow rate: 0.5 mL/min

Injection size: 25 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for L-arabinitol, mannitol, xylitol, galactitol, and sorbitol are about 0.76, 0.81, 1.0, 1.12, and 1.22, respectively.]

Suitability requirements

Resolution: NLT 1.5 between all adjacent polyol peaks, *System suitability solution*

Relative standard deviation: NMT 5.0% for the galactitol peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each polyol (L-arabinitol, galactitol, mannitol, or sorbitol) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the individual polyol from the *Sample solution*

r_S = peak response of the individual polyol from the *Standard solution*

C_S = concentration of the individual polyol in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: The sum of the polyols is NMT 2.0%, calculated on the anhydrous basis.

SPECIFIC TESTS

• **WATER DETERMINATION**, *Method I* (921): NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** (11)

USP L-Arabinitol RS

USP Galactitol RS

USP Mannitol RS

USP Sorbitol RS

USP Xylitol RS

Xylose—see *Xylose General Monographs*

Zein

[9010-66-6].

DEFINITION

Zein is a prolamine derived from corn [*Zea mays* Linné (Fam. Gramineae)].

IDENTIFICATION

• A.

Sample solution: Dissolve 0.1 g in 10 mL of 0.1 N sodium hydroxide.

Analysis: To the *Sample solution* add a few drops of cupric sulfate TS. Warm in a water bath.

Acceptance criteria: A purple color develops.

• B.

Sample solution: In a test tube add 1 mL of nitric acid to 25 mg of Zein.

Analysis: Agitate the *Sample solution* vigorously.

Acceptance criteria: The solution becomes light yellow. Further addition of about 10 mL of 6 N ammonium hydroxide produces an orange color.

• C. SDS-POLYACRYLAMIDE GEL ELECTROPHORESIS

Solvent: 55% isopropyl alcohol with 2% beta mercaptoethanol

Sample loading buffer:¹ 0.5 M Tris hydrochloride pH 6.8, 20% glycerin, 4% sodium dodecyl sulfate (SDS), and 0.005% bromophenol blue

Gel running buffer stock solution:² 0.25 M Tris base pH 8.6, 1.92 M glycine, and 1.0% SDS

Gel running buffer: *Gel running buffer stock solution* and water (1:9)

¹ Available from Invitrogen as Tris-Glycine SDS Sample Buffer (2X), catalog number LC2676.

² Available from Invitrogen as Tris-Glycine SDS Running Buffer (10X), catalog number LC2675.

Gel staining solution: A suitable Coomassie blue-based solution³

Molecular weight marker: Use a suitable molecular weight marker⁴ containing protein bands at 10–190 kDa. [NOTE—A molecular weight marker with protein bands at 10–100 kDa can also be used.]

Molecular weight standard solution: Dilute the *Molecular weight marker* (1:1) with the *Sample loading buffer*. Incubate the mixture in a closed microcentrifuge tube for 10 min at 95°. After incubation, allow the tube to flash-cool on ice. Place the tube in a microcentrifuge, spin at a top speed for a few seconds, and allow to stop on its own to collect any condensation on the sides and top of the tube.

Sample stock solution: 10 mg/mL of Zein in *Solvent*. Mix on a vortex mixer until the sample is fully dissolved. Centrifuge at 10,000–12,000 rpm in a microcentrifuge with a fixed rotor for 10 min to pellet any undissolved material.

Sample solution: Dilute the *Sample stock solution* (1:1) with the *Sample loading buffer*. Incubate the mixture in a closed microcentrifuge tube for 10 min at 95°. After incubation, allow the tube to flash-cool on ice. Place the tube in a microcentrifuge, spin at a top speed for a few seconds, and allow to stop on its own to collect any condensation on the sides and top of the tube.

Electrophoretic system

(See *Electrophoresis* (726).)

SDS-PAGE gel and apparatus setup: Following the manufacturer's instructions, assemble and fill a precast 16% Tris-Glycine Gel⁵ in an appropriate electrophoresis module.

Running buffer: *Gel running buffer*

Voltage: 100 V

Run time: 2.5 h or until the upper dye front is at the bottom of the gel. [NOTE—The total run time may need to be altered, depending on the molecular weight standards as well on as laboratory equipment variability, because the dye front may co-migrate with or close to the lowest bands of the set.]

Analysis

Samples: *Molecular weight standard solution* and *Sample solution*

Gel loading: Load 25 µL of the *Molecular weight standard solution*. Load a volume of the *Sample solution*, equal to approximately 25 µg of calculated Zein. [NOTE—The actual amount of Zein extracted from the starting material cannot be quantified. Therefore, an estimated amount is derived.]

Gel staining: After electrophoresis, carefully remove the gel from the plates. Rinse the gel three times with water. Stain the gel by following the manufacturer's directions for the stain used.

Destaining: After staining as directed by the manufacturer, destain as directed by the manufacturer.

Gel scan procedure: Set up a gel scanner according to the manufacturer's instructions. Place the gel in the detector, and obtain a single image of all loaded lines of the gel.

Acceptance criteria: Zein has two major bands: the α band is at 21–25 kDa, and the β band is at 17–18 kDa.

³ Available from Invitrogen as SimplyBlue Stain, catalog number LC6065.

⁴ Available from Invitrogen as BenchMark Prestained Protein Ladder, catalog number 1074810.

⁵ Available from Invitrogen, catalog number EC6495. However, these are readily available from several other manufacturers.

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION** (281): NMT 2.0%, using an ignition temperature of $800 \pm 25^\circ$

• **HEAVY METALS, Method II** (231): NMT 20 ppm

Organic Impurities

• LIMIT OF HEXANE-SOLUBLE MATTER

Sample: 15 g of Zein

Solvent: Alcohol and water (17:3, w/w)

Analysis: Dissolve the *Sample* in 150 mL of *Solvent*. Stir the mixture, using a magnetic stirrer, and heat the solution to 30°. Once the *Sample* is dissolved, transfer the solution to a 500-mL separatory funnel.

Add 60 mL of *n*-hexane. Shake the mixture, and allow the phases to separate. Discharge the bottom layer (alcohol) to a beaker, and transfer the top layer (hexane) to a first 500-mL flask. Weigh the first 500-mL flask, and record the weight. Pour the bottom layer of alcohol back into the separatory funnel. Repeat this step four more times.

After the five 60-mL hexane solutions have been added to the first 500-mL flask, attach it to a rotary evaporator to distill the hexane. Collect the hexane in a second 500-mL flask.

The first 500-mL flask contains a yellow to reddish oil. Record the weight of the flask containing this oil.

Calculate the percentage of hexane-soluble matter in the portion of Zein taken:

$$\text{Result} = [(W_T - W_F)/W] \times 100$$

W_T = weight of the flask (g)

W_F = weight of the first 500-mL flask (g)

W = weight of the *Sample* (g)

Acceptance criteria

For Zein from normal dent corn: NMT 12.5% for hexane-soluble matter

For Zein from waxy corn: NMT 16.0% for hexane-soluble matter

SPECIFIC TESTS

• **LOSS ON DRYING** (731): Dry a sample at 105° for 2 h: it loses NMT 8.0% of its weight.

• **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total bacterial count does not exceed 10^3 cfu/g, and the tests for *Salmonella* species and *Escherichia coli* are negative.

• PROTEIN CONTENT

Analysis: Proceed as directed in *Nitrogen Determination, Method I* (461). Calculate the weight percentage of the protein content in Zein by multiplying the percentage of nitrogen found by 6.25.

Acceptance criteria: 81.9%–100.0% on the dried basis

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.

• **LABELING:** Label it to indicate the corn source from which it is derived.

Zinc Stearate—see *Zinc Stearate General Monographs*

General chapters

- Acetic acid in peptides (503), 208
- Acid-neutralizing capacity (301), 162
- Acoustic emission (1005), 449
- Aerosols, nasal sprays, metered-dose inhalers, and dry powder inhalers (601), 242
- Alcohol determination (611), 264
- Alginate assay (311), 163
- Alpha tocopherol assay (551), 216
- Alternative microbiological sampling methods for nonsterile inhaled and nasal products (610), 263
- Aluminum (206), 140
- Analysis of biological assays (1034), 521
- Analytical data—interpretation and treatment (1010), 452
- Analytical instrument qualification (1058), 650
- Ancillary materials for cell, gene, and tissue-engineered products (1043), 540
- Antibiotics—microbial assays (81), 76
- Antimicrobial agents—content (341), 164
- Antimicrobial effectiveness testing (51), 54
- Apparent intrinsic dissolution—dissolution testing procedures for rotating disk and stationary disk (1087), 717
- Applications of nuclear magnetic resonance spectroscopy (1761), 1066
- Application of water activity determination to nonsterile pharmaceutical products (1112), 779
- Arsenic (211), 145
- Articles of botanical origin (561), 216
- Assay for citric acid/citrate and phosphate (345), 166
- Assay for steroids (351), 167
- Assessment of drug product performance—bioavailability, bioequivalence, and dissolution (1090), 729
- Automated methods of analysis (16), 43
- Automated radiochemical synthesis apparatus (1015), 464
- Auxiliary packaging components (670), 291
- Bacterial endotoxins test (85), 90
- Barbiturate assay (361), 167
- The biocompatibility of materials used in drug containers, medical devices, and implants (1031), 487
- Biological assay validation (1033), 510
- Biological indicators—resistance performance tests (55), 56
- Biological indicators for sterilization (1035), 536
- Biological reactivity tests, in vitro (87), 94
- Biological reactivity tests, in vivo (88), 95
- Biologics (1041), 539
- Biotechnology-derived articles (1045), 547
- Biotechnology-derived articles—amino acid analysis (1052), 619
- Biotechnology-derived articles—capillary electrophoresis (1053), 629
- Biotechnology-derived articles—isoelectric focusing (1054), 634
- Biotechnology-derived articles—peptide mapping (1055), 636
- Biotechnology-derived articles—polyacrylamide gel electrophoresis (1056), 641

- Biotechnology-derived articles—total protein assay (1057), 646
- Botanical extracts (565), 234
- Bovine serum (1024), 465
- Bulk density and tapped density (616), 265
- Bulk pharmaceutical excipients—certificate of analysis (1080), 700
- Bulk powder sampling procedures (1097), 741
- Calcium pantothenate assay (91), 102
- Cellular and tissue-based products (1046), 558
- Characterization of crystalline and partially crystalline solids by X-ray powder diffraction (XRPD) (941), 443
- Chloride and sulfate (221), 146
- Chromatography (621), 268
- Cleaning glass apparatus (1051), 619
- Cobalamin radiotracer assay (371), 167
- Color and achromicity (631), 275
- Color—instrumental measurement (1061), 664
- Completeness of solution (641), 276
- Congeeing temperature (651), 279
- Containers—glass (660), 282

Inhalation

Acetylcysteine and isoproterenol hydrochloride solution, 2335
 Cromolyn sodium powder, 3111
 Cromolyn sodium solution, 3111
 Dexamethasone sodium phosphate aerosol, 3181
 Epinephrine aerosol, 3417
 Epinephrine bitartrate aerosol, 3420
 Epinephrine solution, 3418
 Ergotamine tartrate aerosol, 3438
 Isoetharine mesylate aerosol, 3979
 Isoetharine solution, 3978
 Isoproterenol hydrochloride aerosol, 3993
 Isoproterenol hydrochloride and phenylephrine bitartrate aerosol, 3995
 Isoproterenol solution, 3992
 Isoproterenol sulfate aerosol, 3997
 Isoproterenol sulfate solution, 3999
 Levalbuterol solution, 4080
 Metaproterenol sulfate aerosol, 4265
 Metaproterenol sulfate solution, 4266
 Racepinephrine solution, 4999
 Ribavirin for solution, 5032
 Sodium chloride, solution, 5159
 Sterile water for, 5590
 Terbutaline sulfate aerosol, 5319
 Tobramycin solution, 5412

Injection

Acepromazine maleate, 2291
 Acetazolamide for, 2327
 Acyclovir for, 2340
 Adenosine, 2347
 Alcohol, dehydrated, 2360
 Alcohol in dextrose, 2361
 Alfentanil, 2365
 Alprostadil, 2383
 Alteplase for, 2386
 Amifostine for, 2434
 Amikacin sulfate, 2436
 Aminocaproic acid, 2445
 Aminohippurate sodium, 2449
 Aminopentamide sulfate, 2449
 Aminophylline, 2451
 Amitriptyline hydrochloride, 2463
 Ammonium chloride, 2469
 Ammonium molybdate, 2472
 Amobarbital sodium for, 2472
 Amphotericin B for, 2488
 Ampicillin for, 2492
 Ampicillin and sulbactam for, 2496
 Anileridine, 2505
 Aprotinin, 2524
 Arginine hydrochloride, 2526
 Articaine hydrochloride and epinephrine, 2529
 Ascorbic acid, 2531
 Atenolol, 2550
 Atracurium besylate, 2559
 Atropine sulfate, 2561
 Azaperone, 2567
 Azathioprine sodium for, 2571
 Azithromycin for, 2576
 Aztreonam, 2584
 Aztreonam for, 2584
 Bacitracin for, 2588
 Bacteriostatic sodium chloride, 5158
 Bacteriostatic water for, 5590
 Benztropine mesylate, 2628
 Benzylpenicilloyl polylysine, 2632
 Betamethasone sodium phosphate, 2646
 Bethanechol chloride, 2653
 Biperiden lactate, 2667
 Bleomycin for, 2683
 Bretylium tosylate, 2686
 Bretylium tosylate in dextrose, 2687
 Brompheniramine maleate, 2696
 Bumetanide, 2700
 Bupivacaine hydrochloride, 2703
 Bupivacaine hydrochloride in dextrose, 2704
 Bupivacaine hydrochloride and epinephrine, 2704
 Butorphanol tartrate, 2726
 C 11, flumazenil, 2798
 C 11, mespiperone, 2799
 C 11, methionine, 2800
 C 11, raclopride, 2800
 C 11, sodium acetate, 2801
 Caffeine citrate, 2732
 Caffeine and sodium benzoate, 2733
 Calcitonin salmon, 2740
 Calcitriol, 2742
 Calcium chloride, 2756
 Calcium gluceptate, 2758
 Calcium gluconate, 2761
 Calcium levulinate, 2766
 Capreomycin for, 2779
 Carbenicillin for, 2792
 Carboplatin for, 2805
 Carboprost tromethamine, 2807
 Carmustine for, 2816
 Cefamandole nafate for, 2842
 Cefazolin, 2846
 Cefazolin for, 2847
 Cefepime for, 2857
 Cefmenoxime for, 2862
 Cefmetazole, 2863
 Cefmetazole for, 2864
 Cefonicid for, 2865
 Cefoperazone, 2866
 Cefoperazone for, 2867
 Ceforanide for, 2868
 Cefotaxime, 2870
 Cefotaxime for, 2871
 Cefotetan, 2872
 Cefotetan for, 2873
 Cefotiam for, 2875
 Cefoxitin, 2877
 Cefoxitin for, 2877
 Cefpiramide for, 2879
 Ceftazidime, 2887
 Ceftazidime for, 2887
 Ceftizoxime, 2890
 Ceftizoxime for, 2890
 Ceftriaxone, 2891
 Ceftriaxone for, 2892
 Cefuroxime, 2896
 Cefuroxime for, 2896
 Cephalothin, 2906
 Cephalothin for, 2907
 Cephapirin for, 2910
 Cephadrine for, 2912
 Chloramphenicol, 2927
 Chloramphenicol sodium succinate for, 2934
 Chlordiazepoxide hydrochloride for, 2939
 Chloroprocaine hydrochloride, 2950

Injection (continued)

- Chloroquine hydrochloride, 2951
- Chlorothiazide sodium for, 2956
- Chlorpheniramine maleate, 2958
- Chlorpromazine hydrochloride, 2965
- Chorionic gonadotropin for, 3764
- Chromic chloride, 2978
- Chromium Cr 51 edetate, 2979
- Cimetidine, 2990
- Cimetidine in sodium chloride, 2991
- Ciprofloxacin, 2998
- Cisplatin for, 3004
- Clavulanic acid and ticarcillin, 5392
- Clindamycin, 3034
- Clindamycin for, 3035
- Cloprostenol, 3066
- Codeine phosphate, 3090
- Colchicine, 3095
- Colistimethate for, 3099
- Corticotropin, 3104
- Corticotropin for, 3105
- Corticotropin, repository, 3106
- Cr 51, sodium chromate, 2978
- Cupric chloride, 3114
- Cupric sulfate, 3116
- Cyanocobalamin, 3117
- Cyclophosphamide for, 3123
- Cyclosporine, 3129
- Cysteine hydrochloride, 3134
- Cytarabine for, 3135
- Dacarbazine for, 3137
- Dactinomycin for, 3139
- Dantrolene sodium for, 3144
- Daunorubicin hydrochloride for, 3148
- Deferoxamine mesylate for, 3150
- Dehydrated alcohol, 2360
- Deslanoside, 3163
- Desmopressin acetate, 3166
- Desoxycorticosterone acetate, 3171
- Dexamethasone, 3175
- Dexamethasone sodium phosphate, 3183
- Dextran 40 in dextrose, 3193
- Dextran 40 in sodium chloride, 3193
- Dextran 70 in dextrose, 3195
- Dextran 70 in sodium chloride, 3195
- Dextrose, 3201
- Dextrose and sodium chloride, 3201
- Diatrizoate meglumine, 3202
- Diatrizoate meglumine and diatrizoate sodium, 3203
- Diatrizoate sodium, 3205
- Diazepam, 3210
- Diazoxide, 3212
- Dibucaine hydrochloride, 3215
- Dicyclomine hydrochloride, 3227
- Diethylstilbestrol, 3238
- Digitoxin, 3245
- Digoxin, 3247
- Dihydroergotamine mesylate, 3251
- Dihydrostreptomycin, 3253
- Dimenhydrinate, 3265
- Dimercaprol, 3268
- Dinoprost tromethamine, 3272
- Diphenhydramine hydrochloride, 3276
- Dipyridamole, 3282
- Dobutamine, 3298
- Dobutamine for, 3299
- Dobutamine in dextrose, 3299
- Docetaxel, 3303
- Dolasetron mesylate, 3314
- Dopamine hydrochloride, 3322
- Dopamine hydrochloride and dextrose, 3323
- Doxapram hydrochloride, 3325
- Doxorubicin hydrochloride, 3332
- Doxorubicin hydrochloride for, 3332
- Doxycycline for, 3334
- Droperidol, 3348
- Dyphylline, 3360
- Edetate calcium disodium, 3369
- Edetate disodium, 3371
- Edrophonium chloride, 3371
- Electrolytes and dextrose type 1, multiple, 3380
- Electrolytes and dextrose type 2, multiple, 3382
- Electrolytes and dextrose type 3, multiple, 3384
- Electrolytes and dextrose type 4, multiple, 3385
- Electrolytes and invert sugar type 1, multiple, 3386
- Electrolytes and invert sugar type 2, 3387
- Electrolytes and invert sugar type 3, 3388
- Electrolytes type 1, multiple, 3377
- Electrolytes type 2, multiple, 3379
- Elements, trace, 3389
- Emetine hydrochloride, 3393
- Enalaprilat, 3400
- Enoxaparin sodium, 3406
- Ephedrine sulfate, 3415
- Epinephrine, 3418
- Ergonovine maleate, 3435
- Ergotamine tartrate, 3439
- Erythromycin, 3446
- Erythromycin ethylsuccinate, 3453
- Erythromycin lactobionate for, 3457
- Estradiol cypionate, 3480
- Estradiol valerate, 3484
- Ethacrynate sodium for, 3496
- Ethiodized oil, 3505
- Etomidate, 3521
- Etoposide, 3525
- Famotidine, 3529
- Fenoldopam mesylate, 3551
- Fentanyl citrate, 3556
- Ferumoxides, 3570
- Floxuridine for, 3591
- Fluconazole, 3594
- Fludarabine phosphate, 3602
- Fludarabine phosphate for, 3603
- Fludeoxyglucose F18, 3622
- Flumazenil, 3608
- Flunixin meglumine, 3613
- Fluorescein, 3620
- F 18, sodium fluoride, 3626
- F 18, fluorodopa, 3624
- Fluorouracil, 3631
- Fluphenazine decanoate, 3639
- Fluphenazine enanthate, 3641
- Fluphenazine hydrochloride, 3642
- Folic acid, 3667
- Fosphenytoin sodium, 3680
- Fructose, 3682
- Fructose and sodium chloride, 3682
- Furosemide, 3686
- Gadodiamide, 3696
- Gadopentetate dimeglumine, 3697
- Gadoteridol, 3701
- Gadoversetamide, 3704
- Gallamine triethiodide, 3711
- Gallium citrate Ga 67, 3712
- Ganciclovir for, 3713
- Gemcitabine for, 3718
- Gentamicin, 3722
- Glucagon for, 3741
- Glycopyrrolate, 3754
- Gold sodium thiomalate, 3757
- Gonadorelin for, 3761
- Gonadotropin, chorionic for, 3764
- Granisetron hydrochloride, 3772
- Guaifenesin for, 3780
- Haloperidol, 3796
- Heparin sodium, 3805
- Histamine phosphate, 3811
- Hyaluronidase, 3816
- Hyaluronidase for, 3817
- Hydralazine hydrochloride, 3819
- Hydrochloric acid, 3820
- Hydrocortisone sodium phosphate, 3843
- Hydrocortisone sodium succinate for, 3844
- Hydromorphone hydrochloride, 3851
- Hydroxocobalamin, 3856
- Hydroxyprogesterone caproate, 3860
- Hydroxyzine hydrochloride, 3863
- Hyoscyamine sulfate, 3870
- I 123, iobenguane, 3926
- I 123, iodohippurate sodium, 3928
- I 125, iothalamate sodium, 3930
- I 125 albumin, iodinated, 3930
- I 131, iobenguane, 3927
- I 131, iodohippurate sodium, 3932
- I 131, rose bengal sodium, 3932
- I 131 albumin, iodinated, 3931
- I 131 albumin aggregated, iodinated, 3931
- Idarubicin hydrochloride for, 3881
- Ifosfamide for, 3884
- Imipenem and cilastatin for, 3886
- Imipramine hydrochloride, 3889
- Inamrinone, 3890
- Indigotindisulfonate sodium, 3894
- Indium In 111 capromab pendetide, 3896
- Indium In 111 ibritumomab tiuxetan, 3898
- Indium In 111 pentetate, 3899
- Indium In 111 pentetreotide, 3900
- Indium In 111 satumomab pendetide, 3901
- Indocyanine green for, 3902
- Indomethacin for, 3910
- Insulin, 3913
- Insulin human, 3914
- Human insulin and human insulin isophane suspension, 3915
- Insulin lispro, 3920
- Inulin in sodium chloride, 3924
- Invert sugar, 5207
- Iodipamide meglumine, 3935
- Iodixanol, 3939
- Iohexol, 3946
- Iopamidol, 3948
- Iophendylate, 3951
- Iopromide, 3953
- Iothalamate meglumine, 3954
- Iothalamate meglumine and iothalamate sodium, 3954
- Iothalamate sodium, 3955
- Ioversol, 3957
- Ioxaglate meglumine and ioxaglate sodium, 3958
- Ioxilan, 3961
- Iron dextran, 3974
- Iron sorbitex, 3975

Injection (*continued*)

- Iron sucrose, 3976
- Isoniazid, 3988
- Isoproterenol hydrochloride, 3994
- Isoxsuprine hydrochloride, 4015
- Ivermectin, 4022
- Ivermectin and clorsulon, 4026
- Kanamycin, 4033
- Ketamine hydrochloride, 4035
- Ketorolac tromethamine, 4041
- Labetalol hydrochloride, 4046
- Leucovorin calcium, 4075
- Levocarnitine, 4093
- Levorphanol tartrate, 4104
- Lidocaine hydrochloride, 4113
- Lidocaine hydrochloride and dextrose, 4114
- Lidocaine hydrochloride and epinephrine, 4114
- Lincomycin, 4119
- Lorazepam, 4150
- Magnesium sulfate, 4190
- Magnesium sulfate in dextrose, 4190
- Mangafodipir trisodium, 4195
- Manganese chloride, 4197
- Manganese sulfate, 4199
- Mannitol, 4200
- Mannitol in sodium chloride, 4201
- Mechlorethamine hydrochloride for, 4210
- Menadiol sodium diphosphate, 4233
- Menadione, 4235
- Menotropins for, 4237
- Meperidine hydrochloride, 4239
- Mezivacaine hydrochloride, 4243
- Mepivacaine hydrochloride and levonordefrin, 4244
- Meropenem for, 4253
- Mesoridazine besylate, 4261
- Metaraminol bitartrate, 4268
- Methadone hydrochloride, 4281
- Methocarbamol, 4295
- Methohexital sodium for, 4296
- Methotrexate, 4300
- Methotrexate for, 4300
- Methotrimeprazine, 4302
- Methyldopate hydrochloride, 4319
- Methylene blue, 4320
- Methylene blue, veterinary, 4321
- Methylergonovine maleate, 4322
- Methylprednisolone sodium succinate for, 4333
- Metoclopramide, 4338
- Metoprolol tartrate, 4346
- Metronidazole, 4355
- Mezlocillin for, 4361
- Miconazole, 4363
- Midazolam, 4367
- Minocycline for, 4375
- Mitomycin for, 4387
- Mitoxantrone, 4389
- Morphine sulfate, 4410
- Morrhuate sodium, 4412
- Mycophenolate mofetil for, 4423
- N 13, ammonia, 4522
- Nafcillin, 4434
- Nafcillin for, 4435
- Nalorphine hydrochloride, 4439
- Naloxone hydrochloride, 4440
- Nandrolone decanoate, 4444
- Nandrolone phenpropionate, 4445
- Neomycin for, 4464
- Neostigmine methylsulfate, 4490
- Netilmicin sulfate, 4492
- Niacin, 4497
- Niacinamide, 4500
- Nitroglycerin, 4524
- Norepinephrine bitartrate, 4532
- O 15, water, 4650
- Ondansetron, 4585
- Orphenadrine citrate, 4600
- Oxacillin, 4607
- Oxacillin for, 4608
- Oxaliplatin, 4613
- Oxaliplatin for, 4615
- Oxymorphone hydrochloride, 4654
- Oxytetracycline, 4656
- Oxytetracycline for, 4659
- Oxytocin, 4664
- Paclitaxel, 4667
- Pamidronate disodium for, 4672
- Papaverine hydrochloride, 4688
- Paricalcitol, 4692
- Particulate matter in injections (788), 350
- Penicillin G potassium, 4713
- Penicillin G potassium for, 4714
- Penicillin G sodium for, 4723
- Pentazocine, 4734
- Pentobarbital sodium, 4737
- Perphenazine, 4748
- Phenobarbital sodium, 4762
- Phentolamine mesylate for, 4770
- Phenylbutazone, 4773
- Phenylephrine hydrochloride, 4775
- Phenytoin sodium, 4790
- Physostigmine salicylate, 4792
- Phytonadione injectable emulsion, 4795
- Piperacillin for, 4811
- Piperacillin and tazobactam for, 4813
- Plicamycin for, 4821
- Polymyxin B for, 4827
- Potassium acetate, 4832
- Potassium chloride concentrate for, 4839
- Potassium chloride in dextrose, 4841
- Potassium chloride in dextrose and sodium chloride, 4842
- Potassium chloride in lactated Ringer's and dextrose, 4843
- Potassium chloride in sodium chloride, 4844
- Potassium phosphates, 4857
- Pralidoxime chloride for, 4863
- Prednisolone sodium phosphate, 4885
- Prednisolone sodium succinate for, 4886
- Prilocaine and epinephrine, 4891
- Prilocaine hydrochloride, 4891
- Procainamide hydrochloride, 4903
- Procaine hydrochloride, 4906
- Procaine hydrochloride and epinephrine, 4907
- Procaine and tetracaine hydrochlorides and levonordefrin, 4908
- Prochlorperazine edisylate, 4911
- Progesterone, 4914
- Promazine hydrochloride, 4921
- Promethazine hydrochloride, 4923
- Propofol injectable emulsion, 4932
- Propoxycaïne and procaine hydrochlorides and levonordefrin, 4834
- Propoxycaïne and procaine hydrochlorides and norepinephrine bitartrate, 4934
- Propranolol hydrochloride, 4948
- Protamine sulfate, 4958
- Protamine sulfate for, 4958
- Pyridostigmine bromide, 4974
- Pyridoxine hydrochloride, 4977
- Quinidine gluconate, 4989
- Ranitidine, 5010
- Ranitidine in sodium chloride, 5013
- Repository corticotropin, 3106
- Reserpine, 5021
- Riboflavin, 5036
- Rifampin for, 5043
- Ringer's, 5053
- Ringer's and dextrose, 5054
- Ringer's and dextrose, half-strength lactated, 5057
- Ringer's and dextrose, lactated, 5056
- Ringer's and dextrose, modified, lactated, 5058
- Ringer's, lactated, 5055
- Ritodrine hydrochloride, 5069
- Ropivacaine hydrochloride, 5084
- Rose bengal sodium I 131, 3932
- Rubidium chloride Rb 82, 5087
- Sargramostim for, 5109
- Scopolamine hydrobromide, 5113
- Secobarbital sodium, 5117
- Secobarbital sodium for, 5118
- Selenious acid, 5121
- Sisomicin sulfate, 5146
- Sm 153 lexidronam, samarium, 5105
- Sodium acetate, 5148
- Sodium bicarbonate, 5152
- Sodium bromide, veterinary, 5154
- Sodium chloride, 5157
- Sodium chloride, bacteriostatic, 5158
- Sodium chromate Cr 51, 2978
- Sodium lactate, 5167
- Sodium nitrite, 5170
- Sodium nitroprusside for, 5171
- Sodium phosphates, 5174
- Sodium sulfate, 5177
- Sodium thiosulfate, 5178
- Somatropin for, 5180
- Strontium chloride Sr 89, 5200
- Streptomycin, 5199
- Streptomycin for, 5199
- Succinylcholine chloride, 5202
- Succinylcholine chloride for, 5203
- Sufentanil citrate, 5206
- Sugar, invert, 5207
- Sulfadiazine sodium, 5219
- Sulfamethoxazole and trimethoprim, 5227
- Sumatriptan, 5243
- Technetium Tc 99m albumin, 5280
- Technetium Tc 99m albumin aggregated, 5281
- Technetium Tc 99m albumin colloid, 5282
- Technetium Tc 99m apcitide, 5284
- Technetium Tc 99m arcitumomab, 5284
- Technetium Tc 99m bisate, 5285
- Technetium Tc 99m depreotide, 5286
- Technetium Tc 99m disofenin, 5286
- Technetium Tc 99m etidronate, 5287
- Technetium Tc 99m exametazime, 5287
- Technetium Tc 99m fanolesomab, 5288
- Technetium Tc 99m gluceptate, 5289
- Technetium Tc 99m lidofenin, 5290
- Technetium Tc 99m mebrofenin, 5291
- Technetium Tc 99m medronate, 5292
- Technetium Tc 99m mertiatide, 5292

Injection (continued)

- Technetium Tc 99m nofetumomab merpentan, 5293
 Technetium Tc 99m oxiseonate, 5294
 Technetium Tc 99m pentetate, 5294
 Technetium Tc 99m pertechnetate, sodium, 5295
 Technetium Tc 99m pyrophosphate, 5296
 Technetium Tc 99m (pyro- and trimeta-) phosphates, 5297
 Technetium Tc 99m red blood cells, 5297
 Technetium Tc 99m sestamibi, 5298
 Technetium Tc 99m succimer, 5299
 Technetium Tc 99m sulfur colloid, 5300
 Technetium Tc 99m tetrofosmin, 5300
 Terbutaline sulfate, 5320
 Testosterone cypionate, 5327
 Testosterone enanthate, 5328
 Testosterone propionate, 5329
 Tetracaine hydrochloride, 5332
 Tetracaine hydrochloride for, 5333
 Tetracaine hydrochloride in dextrose, 5334
 Tetracycline hydrochloride for, 5339
 Thallous chloride TI 201, 5348
 Theophylline in dextrose, 5354
 Thiamine hydrochloride, 5362
 Thiopental sodium for, 5374
 Thiotepa for, 5378
 Thiothixene hydrochloride, 5381
 Thiothixene hydrochloride for, 5382
 Ticarcillin and clavulanic acid, 5392
 Ticarcillin and clavulanic acid for, 5392
 Ticarcillin for, 5391
 Tiletamine and zolazepam for, 5397
 Tilmicosin, 5399
 Tobramycin, 5411
 Tobramycin for, 5411
 Tolazoline hydrochloride, 5421
 Tolbutamide for, 5422
 Trifluoperazine hydrochloride, 5477
 Triflupromazine hydrochloride, 5480
 Trimethobenzamide hydrochloride, 5488
 Tripelennamine hydrochloride, 5494
 Tromethamine for, 5501
 Tubocurarine chloride, 5509
 Tylosin, 5511
 Urea for, 5517
 Valproic acid, 5532
 Vancomycin, 5545
 Vancomycin hydrochloride for, 5546
 Vasopressin, 5549
 Verapamil hydrochloride, 5557
 Verteporfin for, 5565
 Vinblastine sulfate for, 5568
 Vincristine sulfate, 5570
 Vincristine sulfate for, 5572
 Vinorelbine, 5574
 Warfarin sodium for, 5588
 Water for, bacteriostatic, 5590
 Water for, sterile, 5591
 Water for, 5589

 methoxide, half-normal (0.5 N) in methanol, 1225

Sodium (*continued*)

methoxide, tenth-normal (0.1 N) (in toluene), 1225
 molybdate, 1194
 monofluorophosphate, 5168
 nitrate, 1194
 nitrite, 1194, 5169
 nitrite injection, 5170
 nitrite, tenth-molar (0.1 M), 1225
 nitroferricyanide, 1194
 nitroferricyanide TS, 1217
 nitroprusside, 5170
 nitroprusside for injection, 5171
 1-octanesulfonate, 1194
 oxalate, 1194
 (tri) pentacyanoamino ferrate, 1194
 1-pentanesulfonate, 1195
 1-pentanesulfonate, anhydrous, 1195
 perchlorate, 1195
 peroxide, 1195
 pertechnetate Tc 99m injection, 5295
 phenylbutyrate oral suspension, 5171
 phosphate, dibasic, 1195, 5172
 phosphate, dibasic, anhydrous, 1195
 phosphate, dibasic, dihydrate, 1195
 phosphate, dibasic, dodecahydrate, 1195
 phosphate, dibasic, heptahydrate, 1195
 phosphate, dibasic, TS, 1217
 phosphate, monobasic, 1195, 5173
 phosphate, monobasic, anhydrous, 1195
 phosphate, monobasic, dihydrate, 1195
 phosphate P 32 solution, 4791
 phosphate, tribasic, 2205
 phosphates injection, 5174
 phosphates oral solution, 5174
 phosphates rectal solution, 5174
 phosphate, tribasic, 1195
 phosphite pentahydrate, 1195
 phosphotungstate TS, 1217
 polystyrene sulfonate, 5175
 polystyrene sulfonate suspension, 5175
 and potassium bicarbonates and citric acid effervescent tablets for oral solution, 4835
 propionate, 2206
 pyrophosphate, 1195
 pyruvate, 1195
 salicylate, 1195, 5176
 salicylate tablets, 5176
 selenite, 1195
 starch glycolate, 2207
 stearate, 2208
 stearyl fumarate, 2209
 sulfate, 1195, 5176
 sulfate, anhydrous, 1195
 sulfate decahydrate, 1196
 sulfate injection, 5177
 sulfide, 1196, 5177
 sulfide topical gel, 5177
 sulfide TS, 1217
 sulfite, 1196, 2210
 sulfite, anhydrous, 1196
p-sulfophenylazochromotropate, 1196
 tartrate, 1196, 2211
 tartrate TS, 1217
 tetraphenylborate, 1196
 tetraphenylboron, 1196
 tetraphenylboron, fiftieth-molar (0.02 M), 1225
 tetraphenylboron TS, 1217
 thioglycolate, 1196
 thioglycolate TS, 1217

thiosulfate, 1196, 5178
 thiosulfate injection, 5178
 thiosulfate, tenth-normal (0.1 N), 1225
 thiosulfate TS, 1217
 L-thyroxine, 1196
 3-(trimethylsilyl)-1-propane sulfonate, 1196
 tungstate, 1196
 Solubilities, 1240
 Soluble starch, 1196

Solution

Acetaminophen and codeine phosphate oral, 2316
 Acetaminophen, dextromethorphan hydrobromide, doxylamine succinate, and pseudoephedrine hydrochloride oral, 2319
 Acetaminophen for effervescent oral, 2294
 Acetaminophen oral, 2293
 Acetic acid otic, 2330
 Acetylcholine chloride for ophthalmic, 2333
 Acetylcysteine, 2334
 Acidulated phosphate and sodium fluoride topical, 5164
 Aluminum acetate topical, 2401
 Aluminum chlorohydrate, 2402
 Aluminum dichlorohydrate, 2405
 Aluminum sesquichlorohydrate, 2409
 Aluminum subacetate topical, 2411
 Aluminum sulfate and calcium acetate for topical, 2412
 Aluminum sulfate and calcium acetate tablets for topical, 2412
 Aluminum zirconium octachlorohydrate, 2414
 Aluminum zirconium octachlorohydrate gly, 2416
 Aluminum zirconium pentachlorohydrate, 2418
 Aluminum zirconium pentachlorohydrate gly, 2420
 Aluminum zirconium tetrachlorohydrate, 2422
 Aluminum zirconium tetrachlorohydrate gly, 2424
 Aluminum zirconium trichlorohydrate, 2426
 Aluminum zirconium trichlorohydrate gly, 2427
 Amantadine hydrochloride oral, 2431
 Aminobenzoate potassium for oral, 2442
 Aminobenzoic acid topical, 2444
 Aminocaproic acid oral, 2446
 Aminophylline oral, 2452
 Aminophylline rectal, 2452
 Ammonia, diluted, 1183
 Ammonia, strong, 1882
 Ampromilium oral, 2498
 Anticoagulant citrate dextrose, 2512
 Anticoagulant citrate phosphate dextrose, 2513
 Anticoagulant citrate phosphate dextrose adenine, 2514
 Anticoagulant heparin, 3806
 Anticoagulant sodium citrate, 2515
 Antipyrine and benzocaine otic, 2517
 Antipyrine, benzocaine, and phenylephrine hydrochloride otic, 2517

Apraclonidine ophthalmic, 2521
 Aromatic elixir, 1888
 Ascorbic acid oral, 2532
 Aspirin effervescent tablets for oral, 2540
 Atenolol oral, 2550
 Atropine sulfate ophthalmic, 2563
 Benoxinate hydrochloride ophthalmic, 2613
 Benzaldehyde elixir, compound, 1898
 Benzalkonium chloride, 1900
 Benzethonium chloride topical, 2614
 Benzocaine, butamben, and tetracaine hydrochloride topical, 2620
 Benzocaine otic, 2618
 Benzocaine topical, 2619
 Betamethasone oral, 2637
 Betaxolol ophthalmic, 2650
 Bethanechol chloride oral, 2654
 Bromodiphenhydramine hydrochloride and codeine phosphate oral, 2694
 Bromodiphenhydramine hydrochloride oral, 2694
 Brompheniramine maleate and pseudoephedrine sulfate oral, 2697
 Brompheniramine maleate oral, 2696
 Butabarbital sodium oral, 2715
 Butorphanol tartrate nasal, 2727
 Caffeine citrate oral, 2733
 Calcitonin salmon nasal, 2741
 Calcium glubionate syrup, 2757
 Calcium hydroxide topical, 2762
 Captopril oral, 2783
 Carbachol intraocular, 2787
 Carbachol ophthalmic, 2787
 Carbamide peroxide topical, 2792
 Carbol-fuchsin topical, 2796
 C 13 for oral, urea, 2803
 Carteolol hydrochloride ophthalmic, 2821
 Cefazolin ophthalmic, 2847
 Cetylpyridinium chloride topical, 2922
 Cherry syrup, 1958
 Chloral hydrate oral, 2924
 Chloramphenicol for ophthalmic, 2928
 Chloramphenicol ophthalmic, 2928
 Chloramphenicol oral, 2929
 Chloramphenicol otic, 2929
 Chlorhexidine gluconate, 2943
 Chlorpheniramine maleate and pseudoephedrine hydrochloride oral, 2963
 Chlorpheniramine maleate oral, 2959
 Chlorpromazine hydrochloride syrup, 2966
 Chocolate syrup, 1964
 Cholecalciferol, 2975
 Chymotrypsin for ophthalmic, 2981
 Ciprofloxacin ophthalmic, 3000
 Clindamycin hydrochloride oral, 3030
 Clindamycin palmitate hydrochloride for oral, 3031
 Clindamycin phosphate topical, 3036
 Clobetasol propionate topical, 3044
 Clotrimazole topical, 3073
 Cloxacillin sodium for oral, 3079
 Coal tar topical, 3082
 Cyanocobalamin Co 57 oral, 3082
 Cocaine hydrochloride tablets for topical, 3085
 Cocaine and tetracaine hydrochlorides and epinephrine topical, 3085

Solution (*continued*)

- Cromolyn sodium ophthalmic, 3112
 Cupriethylenediamine hydroxide, 1.0 M, 1156
 Cyclopentolate hydrochloride ophthalmic, 3121
 Cyclosporine oral, 3130
 Cyproheptadine hydrochloride oral, 3131
 Demecarium bromide ophthalmic, 3152
 Dexamethasone elixir, 3174
 Dexamethasone oral, 3177
 Dexamethasone sodium phosphate ophthalmic, 3184
 Dexbrompheniramine maleate and pseudoephedrine sulfate oral, 3185
 Dexchlorpheniramine maleate oral, 3186
 Dextromethorphan hydrobromide oral, 3200
 Diatrizoate meglumine and diatrizoate sodium, 3204
 Diatrizoate sodium, 3206
 Dichlorophenol–indophenol, standard, 1220
 Dicyclomine hydrochloride oral, 3227
 Didanosine for oral, 3231
 Diethyltoluamide topical, 3239
 Digoxin oral, 3248
 Dihydratachysterol oral, 3254
 Diltiazem hydrochloride oral, 3263
 Dimenhydrinate oral, 3266
 Dimethyl sulfoxide topical, 3270
 Diphenhydramine hydrochloride oral, 3277
 Diphenoxylate hydrochloride and atropine sulfate oral, 3279
 Dipivefrin hydrochloride ophthalmic, 3281
 Docusate sodium, 3310
 Docusate sodium syrup, 3310
 Dolasetron mesylate oral, 3314
 Doxepin hydrochloride oral, 3330
 Doxylamine succinate oral, 3344
 Dyclonine hydrochloride topical, 3358
 Dyphylline and guaifenesin oral, 3362
 Dyphylline oral, 3361
 Ecamsule, 3364
 Echothiophate iodide for ophthalmic, 3367
 Emedastine ophthalmic, 3392
 Ephedrine sulfate oral, 3416
 Epinephrine bitartrate for ophthalmic, 3422
 Epinephrine bitartrate ophthalmic, 3421
 Epinephrine ophthalmic, 3419
 Epinephryl borate ophthalmic, 3422
 Ergocalciferol oral, 3429
 Ergolid mesylates oral, 3433
 Erythromycin topical, 3448
 Ethosuximide oral, 3509
 Fehling's, 1213
 Ferric ammonium citrate for oral, 2470
 Ferric subsulfate, 3557
 Ferrous gluconate oral, 3564
 Ferrous sulfate oral, 3567
 Ferrous sulfate syrup, 3568
 Fluocinolone acetonide topical, 3616
 Fluocinonide topical, 3618
 Fluorescein sodium and benoxinate hydrochloride ophthalmic, 3621
 Fluorescein sodium and proparacaine hydrochloride ophthalmic, 3622
 Fluorouracil topical, 3631
 Fluoxetine oral, 3635
 Fluphenazine hydrochloride elixir, 3642
 Fluphenazine hydrochloride oral, 3642
 Flurbiprofen sodium ophthalmic, 3650
 Formaldehyde, 1167, 3669
 Furosemide oral, 3687
 Gentamicin sulfate and betamethasone acetate ophthalmic, 3723
 Gentamicin sulfate and betamethasone valerate otic, 3725
 Gentamicin topical, 3725
 Gentamicin sulfate ophthalmic, 3723
 Gentian violet topical, 3729
 Glutaral disinfectant, 2027
 Glycerin ophthalmic, 3750
 Glycerin oral, 3751
 Guaifenesin and codeine phosphate oral, 3782
 Guaifenesin oral, 3781
 Halazone tablets for, 3792
 Halcinonide topical, 3794
 Haloperidol oral, 3796
 Heparin lock flush, 3800
 Homatropine hydrobromide ophthalmic, 3813
 Hydralazine hydrochloride oral, 3819
 Hydrocortisone and acetic acid otic, 3835
 Hydrogen peroxide, 1169
 Hydrogen peroxide topical, 3849
 Hydroquinone topical, 3855
 Hydroxyamphetamine hydrobromide ophthalmic, 3857
 Hydroxyzine hydrochloride oral, 3863
 Hyoscyamine sulfate elixir, 3869
 Hyoscyamine sulfate oral, 3870
 Hypromellose ophthalmic, 3873
 Idoxuridine ophthalmic, 3882
 Indium In 111 chloride, 3897
 Indium In 111 oxyquinoline, 3899
 Iodine, strong, 3925
 Sodium iodide I 123, 3929
 Sodium iodide I 131, 3934
 Iodine topical, 3925
 Ipecac oral, 3964
 Isoniazid oral, 3988
 Isosorbide oral, 4000
 Ivermectin topical, 4025
 Lactulose, 4050
 Lead, standard, 1217
 Levalbuterol inhalation, 4080
 Levobunolol hydrochloride ophthalmic, 4091
 Levocarnitine oral, 4094
 Levofloxacin oral, 4101
 Lidocaine hydrochloride topical, 4114
 Lincomycin oral, 4119
 Lithium oral, 4133
 Locke–Ringer's, 1214
 Loperamide hydrochloride oral, 4136
 Loratadine oral, 4145
 Mafenine acetate for topical, 4169
 Magnesium carbonate and citric acid for oral, 4176
 Magnesium carbonate, citric acid, and potassium citrate for oral, 4177
 Manganese chloride for oral, 4197
 Magnesium citrate for oral, 4181
 Magnesium citrate oral, 4180
 Maltitol, 2082
 Meperidine hydrochloride oral, 4240
 Mesoridazine besylate oral, 4261
 Metaproterenol sulfate oral, 4266
 Methadone hydrochloride oral, 4281
 Methdilazine hydrochloride oral, 4286
 Methenamine mandelate for oral, 4291
 Methenamine oral, 4288
 Methoxsalen topical, 4304
 Methylcellulose ophthalmic, 4313
 Methylcellulose oral, 4314
 Metoclopramide oral, 4339
 Metoprolol tartrate oral, 4346
 Mibolerone oral, 4362
 Minoxidil topical, 4379
 Mometasone furoate topical, 4397
 Moxifloxacin ophthalmic, 4414
 Myrrh topical, 4429
 Nafcillin sodium for oral, 4435
 Naphazoline hydrochloride ophthalmic, 4447
 Naphazoline hydrochloride and pheniramine maleate ophthalmic, 4447
 Neomycin and polymyxin B sulfates and gramicidin ophthalmic, 4481
 Neomycin and polymyxin B sulfates and hydrocortisone otic, 4482
 Neomycin and polymyxin B sulfates for irrigation, 4474
 Neomycin and polymyxin B sulfates ophthalmic, 4475
 Neomycin sulfate and dexamethasone sodium phosphate ophthalmic, 4467
 Neomycin sulfate oral, 4465
 Nickel standard TS, 1215
 Nitrofurazone topical, 4522
 Nitromersol topical, 4526
 Norfloxacin ophthalmic, 4539
 Nortriptyline hydrochloride oral, 4547
 Ofloxacin ophthalmic, 4559
 Olopatadine hydrochloride ophthalmic, 4567
 Ondansetron, oral, 4586
 Oral, containing at least three of the following—acetaminophen and (salts of) chlorpheniramine, dextromethorphan, and phenylpropanolamine, 2302
 Oral, containing at least three of the following—acetaminophen and (salts of) chlorpheniramine, dextromethorphan, and pseudoephedrine, 2310
 Orange syrup, 2118
 Oxacillin sodium for oral, 4608
 Oxtriphylline oral, 4630
 Oxybutynin chloride oral, 4634
 Oxycodone hydrochloride oral, 4640
 Oxymetazoline hydrochloride ophthalmic, 4652
 Papain tablets for topical, 4687
 Paromomycin oral, 4695
 Penicillin G potassium for oral, 4714
 Penicillin V potassium for oral, 4727
 Perphenazine oral, 4749
 Perphenazine syrup, 4749
 Phenobarbital oral, 4760
 Phenol, topical, camphorated, 4764
 Phenylephrine hydrochloride ophthalmic, 4777
 Phenylpropanolamine hydrochloride oral, 4781
 Phosphate P 32, sodium, 4791
 Physostigmine salicylate ophthalmic, 4793
 Pilocarpine hydrochloride ophthalmic, 4799
 Pilocarpine nitrate ophthalmic, 4802
 Piperazine citrate syrup, 4816

Solution (continued)

- Podophyllum resin topical, 4823
 Polyethylene glycol 3350 and electrolytes for oral, 4825
 Polymyxin B sulfate and hydrocortisone otic, 4828
 Polymyxin B sulfate and trimethoprim ophthalmic, 4829
 Potassium bicarbonate effervescent tablets for oral, 4833
 Potassium bicarbonate and potassium chloride for effervescent oral, 4834
 Potassium bicarbonate and potassium chloride effervescent tablets for oral, 4834
 Potassium bicarbonate, potassium chloride, and potassium citrate effervescent tablets for oral, 4843
 Potassium bromide oral, veterinary, 4837
 Potassium chloride for oral, 4840
 Potassium chloride oral, 4840
 Potassium citrate and citric acid oral, 4846
 Potassium gluconate and potassium chloride for oral, 4850
 Potassium gluconate and potassium chloride oral, 4849
 Potassium gluconate, potassium citrate, and ammonium chloride oral, 4851
 Potassium gluconate and potassium citrate oral, 4850
 Potassium gluconate oral, 4848
 Potassium iodide oral, 4852
 Potassium nitrate, 4854
 Potassium and sodium bicarbonates and citric acid effervescent tablets for oral, 4835
 Povidone-iodine cleansing, 4862
 Povidone-iodine topical, 4862
 Prednisolone oral, 4880
 Prednisolone sodium phosphate ophthalmic, 4885
 Prednisone oral, 4888
 Prochlorperazine oral, 4909
 Promazine hydrochloride oral, 4921
 Promazine hydrochloride syrup, 4921
 Promethazine hydrochloride oral, 4923
 Proparacaine hydrochloride ophthalmic, 4929
 Protein standard (8 g/dL), 1186
 Pseudoephedrine hydrochloride, carbinoxamine maleate, and dextromethorphan hydrobromide oral, 4964
 Pseudoephedrine hydrochloride oral, 4961
 Pyridostigmine bromide oral, 4975
 Ranitidine oral, 5011
 Reserpine oral, 5022
 Risperidone oral, 5064
 Saccharin sodium oral, 5096
 Scopolamine hydrobromide ophthalmic, 5114
 Senna oral, 5125
 Silver nitrate ophthalmic, 5139
 Sodium acetate, 5148
 Sodium bromide oral, veterinary, 5154
 Sodium chloride, isotonic, 1193
 Sodium chloride ophthalmic, 5159
 Sodium chloride tablets for, 5160
 Sodium citrate and citric acid oral, 5161
 Sodium fluoride and acidulated phosphate topical, 5164
 Sodium fluoride oral, 5163
 Sodium hypochlorite, 1194, 5166
 Sodium hypochlorite topical, 5166
 Sodium lactate, 5168
 Sodium phosphate P 32, 4791
 Sodium phosphates oral, 5174
 Sodium phosphates rectal, 5174
 Sorbitol, 5181
 Sorbitol noncrystallizing, 2218
 Sorbitol sorbitan, 2219
 Stavudine for oral, 5196
 Sulfacetamide sodium ophthalmic, 5211
 Sulfaquinoxaline oral, 5232
 Suprofen ophthalmic, 5249
 Syrup, 2262
 Terpin hydrate and codeine oral, 5323
 Terpin hydrate oral, 5323
 Tetracaine hydrochloride ophthalmic, 5333
 Tetracaine hydrochloride topical, 5334
 Tetracycline hydrochloride for topical, 5340
 Tetrahydrozoline hydrochloride ophthalmic, 5346
 Tetramethylammonium hydroxide, in methanol, 1200
 Theophylline and guaifenesin oral, 5357
 Theophylline oral, 5352
 Theophylline sodium glycinate oral, 5358
 Thiamine hydrochloride oral, 5363
 Thiamine mononitrate oral, 5365
 Thimerosal topical, 5370
 Thioridazine hydrochloride oral, 5376
 Thiothixene hydrochloride oral, 5382
 Timolol maleate ophthalmic, 5401
 Tobramycin ophthalmic, 5414
 Tolnaftate topical, 5429
 Tolu balsam syrup, 2265
 Travoprost ophthalmic, 5450
 Tretinoin topical, 5455
 Triamcinolone diacetate oral, 5461
 Tricitrates oral, 5472
 Trifluoperazine oral, 5477
 Trihexyphenidyl hydrochloride oral, 5483
 Trikates oral, 5485
 Trimeprazine oral, 5486
 Triprolidine hydrochloride oral, 5495
 Triprolidine and pseudoephedrine hydrochlorides oral, 5497
 Tropicamide ophthalmic, 5502
 Valproic acid oral, 5535
 Valrubicin intravesical, 5537
 Vancomycin hydrochloride for oral, 5547
 Vehicle for oral, 2116
 Vehicle for oral, sugar free, 2116
 Verapamil hydrochloride oral, 5558
 Vitamins with minerals, water-soluble oral, 1818
 Vitamins, oil- and water-soluble oral, 1683
 Vitamins with minerals, oil- and water-soluble oral, 1736
 Xanthan gum, 2279
 Zidovudine oral, 5615
 Zinc sulfate ophthalmic, 5629
 Zinc sulfate oral, 5630

 Amoxicillin tablets for oral, 2484
 Ampicillin for injectable, 2493

Ampicillin for oral, 2494
 Ampicillin and probenecid for oral, 2495
 Atovaquone oral, 2556
 Aurothioglucose injectable, 2566
 Azathioprine oral, 2569
 Azithromycin for oral, 2579
 Bacampicillin hydrochloride for oral, 2586
 Baclofen oral, 2593
 Barium sulfate, 2601
 Barium sulfate for, 2602
 Betamethasone sodium phosphate and
 betamethasone acetate injectable, 2646
 Bethanechol chloride oral, 2654
 Bisacodyl rectal, 2669
 Bismuth subsalicylate oral, 2677
 Brinzolamide ophthalmic, 2689
 Calamine topical, 2734
 Calamine topical, phenolated, 2735
 Calcium carbonate oral, 2749
 Calcium and magnesium carbonates oral,
 2754
 Captopril oral, 2783
 Carbamazepine oral, 2788
 Cefaclor for oral, 2837
 Cefadroxil for oral, 2840
 Cefdinir for oral, 2852
 Cefixime for oral, 2860
 Cefpodoxime proxetil for oral, 2881
 Cefprozil for oral, 2883
 Cefuroxime axetil for oral, 2893
 Cellulose sodium phosphate for oral, 2901
 Cephalixin for oral, 2904
 Cephadrine for oral, 2913
 Chloramphenicol and hydrocortisone
 acetate for ophthalmic, 2930
 Chloramphenicol palmitate oral, 2933
 Chlorothiazide oral, 2955
 Cholestyramine for oral, 2977
 Chromic phosphate P 32, 4790
 Ciclopirox olamine topical, 2985
 Ciprofloxacin and dexamethasone otic,
 2996
 Clarithromycin for oral, 3018
 Clavulanate potassium and amoxicillin for
 oral, 2479
 Clindamycin phosphate topical, 3036
 Clonazepam oral, 3053
 Colestipol hydrochloride for oral, 3097
 Colistin and neomycin sulfates and
 hydrocortisone acetate otic, 3100
 Colistin sulfate for oral, 3100
 Corticotropin zinc hydroxide injectable,
 3106
 Cortisone acetate injectable, 3108
 Demeclocycline oral, 3154
 Desoxycorticosterone pivalate injectable,
 3173
 Dexamethasone acetate injectable, 3179
 Dexamethasone ophthalmic, 3176
 Diazoxide oral, 3213
 Dicloxacillin sodium for oral, 3225
 Didanosine tablets for oral, 3232
 Diltiazem hydrochloride oral, 3263
 Dipyrindamole oral, 3283
 Dolasetron mesylate oral, 3315
 Doxycycline calcium oral, 3336
 Doxycycline for oral, 3335
 Erythromycin estolate for oral, 3451
 Erythromycin estolate oral, 3450
 Erythromycin estolate and sulfisoxazole
 acetyl oral, 3451

Erythromycin ethylsuccinate for oral, 3454
 Erythromycin ethylsuccinate oral, 3454
 Erythromycin ethylsuccinate and
 sulfisoxazole acetyl for oral, 3456
 Estradiol injectable, 3475
 Estrone injectable, 3493
 Famotidine for oral, 3530
 Ferumoxsil oral, 3572
 Flucytosine oral, 3599
 Fluorometholone ophthalmic, 3629
 Furazolidone oral, 3685
 Ganciclovir oral, 3714
 Gentamicin and prednisolone acetate
 ophthalmic, 3727
 Griseofulvin oral, 3777
 Hydrocortisone acetate injectable, 3838
 Hydrocortisone acetate ophthalmic, 3839
 Hydrocortisone injectable, 3833
 Hydrocortisone rectal, 3834
 Hydroxyzine pamoate oral, 3866
 Ibuprofen oral, 3876
 Imipenem and cilastatin for injectable,
 3887
 Indomethacin oral, 3907
 Isophane insulin human, 3917
 Human insulin isophane and human insulin
 injection, 3915
 Insulin human zinc, 3922
 Insulin human zinc, extended, 3922
 Isophane insulin, 3916
 Insulin zinc, 3920
 Insulin zinc, extended, 3921
 Insulin zinc, prompt, 3921
 Isoflupredone acetate injectable, 3981
 Ketoconazole oral, 4036
 Labetalol hydrochloride oral, 4046
 Loracarbef for oral, 4142
 Magaldrate and simethicone oral, 4172
 Magaldrate oral, 4171
 Magnesium carbonate and sodium
 bicarbonate for oral, 4177
 Mebendazole oral, 4205
 Medroxyprogesterone acetate injectable,
 4217
 Megestrol acetate oral, 4223
 Meloxicam oral, 4228
 Meprobamate oral, 4246
 Mesalamine rectal, 4256
 Methacycline hydrochloride oral, 4279
 Methadone hydrochloride tablets for oral,
 4282
 Methenamine mandelate oral, 4291
 Methyldopa oral, 4315
 Methylprednisolone acetate injectable,
 4332
 Metolazone oral, 4341
 Metoprolol tartrate oral, 4347
 Minocycline hydrochloride oral, 4376
 Nalidixic acid oral, 4438
 Naproxen oral, 4449
 Natamycin ophthalmic, 4457
 Neomycin and polymyxin B sulfates and
 dexamethasone ophthalmic, 4480
 Neomycin and polymyxin B sulfates and
 hydrocortisone otic, 4483
 Neomycin and polymyxin B sulfates and
 hydrocortisone acetate ophthalmic, 4483
 Neomycin and polymyxin B sulfates and
 hydrocortisone ophthalmic, 4482

Suspension (*continued*)

Neomycin and polymyxin B sulfates and prednisolone acetate ophthalmic, 4485
 Neomycin sulfate and hydrocortisone otic, 4470
 Neomycin sulfate and hydrocortisone acetate ophthalmic, 4471
 Neomycin sulfate and prednisolone acetate ophthalmic, 4486
 Nevirapine oral, 4493
 Nitrofurantoin oral, 4518
 Nystatin for oral, 4551
 Nystatin oral, 4551
 Ondansetron hydrochloride oral, 4584
 Oxfendazole oral, 4627
 Oxytetracycline and nystatin for oral, 4657
 Oxytetracycline calcium oral, 4658
 Oxytetracycline hydrochloride and hydrocortisone acetate ophthalmic, 4660
 Pantoprazole oral, 4679
 Penicillin G benzathine injectable, 4709
 Penicillin G benzathine and penicillin G procaine injectable, 4711
 Penicillin G benzathine oral, 4710
 Penicillin G, neomycin, polymyxin B, hydrocortisone acetate, and hydrocortisone sodium succinate topical, 4707
 Penicillin G procaine, dihydrostreptomycin sulfate, chlorpheniramine maleate, and dexamethasone injectable, 4719
 Penicillin G procaine and dihydrostreptomycin sulfate injectable, 4719
 Penicillin G procaine, dihydrostreptomycin sulfate, and prednisolone injectable, 4721
 Penicillin G procaine, neomycin and polymyxin B sulfates, and hydrocortisone acetate topical, 4722
 Penicillin G procaine injectable, 4717
 Penicillin G procaine for injectable, 4718
 Penicillin V benzathine oral, 4726
 Penicillin V for oral, 4725
 Perflutren protein-type A microspheres injectable, 4742
 Pergolide, oral, veterinary, 4745
 Phenytoin oral, 4784
 Phosphate P 32, chromic, 4790
 Prednisolone acetate injectable, 4881
 Prednisolone acetate ophthalmic, 4882
 Prednisone injectable, 4889
 Prednisolone tebutate injectable, 4887
 Primidone oral, 4896
 Progesterone injectable, 4916
 Propoxyphene napsylate oral, 4941
 Propylidone injectable oil, 4955
 Psyllium hydrophilic mucilloid for oral, 4968
 Pyrantel pamoate oral, 4971
 Pyrvinium pamoate oral, 4982
 Quinidine sulfate oral, 4993
 Ractopamine hydrochloride, 5000
 Resorcinol and sulfur topical, 5031
 Rifampin oral, 5044
 Rimexolone ophthalmic, 5053
 Selenium sulfide topical, 5122
 Simethicone oral, 5142
 Sodium polystyrene sulfonate, 5175
 Spectinomycin for injectable, 5186
 Structured vehicle, 2262
 Structured vehicle, sugar-free, 2262

Sulfacetamide sodium and prednisolone acetate ophthalmic, 5213
 Sulfacetamide sodium topical, 5212
 Sulfadimethoxine oral, 5220
 Sulfamethizole oral, 5225
 Sulfamethoxazole oral, 5227
 Sulfamethoxazole and trimethoprim oral, 5229
 Sulfisoxazole acetyl oral, 5238
 Sumatriptan succinate oral, 5247
 Testosterone injectable, 5326
 Tetracycline hydrochloride ophthalmic, 5341
 Tetracycline hydrochloride oral, 5342
 Tetracycline oral, 5336
 Thiabendazole oral, 5360
 Thioridazine oral, 5375
 Tobramycin and dexamethasone ophthalmic, 5415
 Tobramycin and fluorometholone acetate ophthalmic, 5416
 Triamcinolone acetonide injectable, 5460
 Triamcinolone diacetate injectable, 5462
 Triamcinolone hexacetonide injectable, 5463
 Trifluoromazine oral, 5479
 Trisulfapyrimidines oral, 5498
 Vehicle for oral, 2116
 Verapamil hydrochloride oral, 5558
 Zinc sulfide topical, 5631

Suspension structured vehicle, 2262

- Meprobamate, 4246
- Mercaptopurine, 4249
- Mesalamine delayed-release, 4257
- Mesoridazine besylate, 4262
- Metaproterenol sulfate, 4267
- Metformin hydrochloride, 4269
- Metformin hydrochloride extended-release, 4271
- Methadone hydrochloride, 4282
- Methamphetamine hydrochloride, 4283
- Methazolamide, 4285
- Methdilazine hydrochloride, 4286
- Methenamine, 4288
- Methenamine hippurate, 4290
- Methenamine mandelate, 4292
- Methenamine mandelate delayed-release, 4292
- Methimazole, 4293
- Methocarbamol, 4295
- Methotrexate, 4301
- Methscopolamine bromide, 4306
- Methyclothiazide, 4309
- Methylcellulose, 4314
- Methyldopa, 4316
- Methyldopa and chlorothiazide, 4316

Tablets (continued)

- Methyldopa and hydrochlorothiazide, 4317
 Methylergonovine maleate, 4323
 Methylphenidate hydrochloride, 4326
 Methylphenidate hydrochloride extended-release, 4327
 Methylprednisolone, 4330
 Methylsulfonylmethane, 1537
 Methyltestosterone, 4336
 Methysergide maleate, 4337
 Metoclopramide, 4339
 Metolazone, 4341
 Metoprolol succinate extended-release, 4344
 Metoprolol tartrate, 4348
 Metoprolol tartrate and hydrochlorothiazide, 4348
 Metronidazole, 4355
 Metyrapone, 4357
 Midodrine hydrochloride, 4370
 Milk thistle, 1544
 Minerals, 1553
 Minocycline hydrochloride, 4378
 Minoxidil, 4379
 Mirtazapine, 4382
 Mirtazapine orally disintegrating, 4383
 Mitotane, 4388
 Modafinil, 4391
 Molindone hydrochloride, 4393
 Moricizine hydrochloride, 4407
 Mycophenolate mofetil, 4426
 Nabumetone, 4431
 Nadolol, 4432
 Nadolol and bendroflumethiazide, 4433
 Nafcillin sodium, 4436
 Nalidixic acid, 4438
 Naltrexone hydrochloride, 4443
 Naproxen, 4449
 Naproxen delayed-release, 4450
 Naproxen sodium, 4451
 Naratriptan, 4455
 Nateglinide, 4460
 Nefazodone hydrochloride, 4462
 Neomycin sulfate, 4465
 Neostigmine bromide, 4489
 Nevirapine, 4495
 Niacin, 4497
 Niacinamide, 4501
 Niacin extended-release, 4498
 Nifedipine extended-release, 4509
 Nitrofurantoin, 4519
 Nitroglycerin, sublingual, 4524
 Norethindrone, 4533
 Norethindrone acetate, 4537
 Norethindrone acetate and ethinyl estradiol, 4538
 Norethindrone and ethinyl estradiol, 4534
 Norethindrone and mestranol, 4535
 Norfloxacin, 4540
 Norgestimate and ethinyl estradiol, 4543
 Norgestrel, 4545
 Norgestrel and ethinyl estradiol, 4545
 Nystatin, 4551
 Ofloxacin, 4559
 Olanzapine, 4562
 Ondansetron, 4587
 Ondansetron orally disintegrating, 4590
 Orbifloxacin, 4594
 Orphenadrine citrate extended-release, 4601
 Oxandrolone, 4619
 Oxaprozin, 4621
 Oxazepam, 4624
 Oxprenolol hydrochloride, 4628
 Oxprenolol hydrochloride extended-release, 4629
 Oxtriphylline, 4630
 Oxtriphylline delayed-release, 4631
 Oxtriphylline extended-release, 4632
 Oxybutynin chloride, 4634
 Oxybutynin chloride extended-release, 4635
 Oxycodone and acetaminophen, 4645
 Oxycodone and aspirin, 4646
 Oxycodone hydrochloride, 4641
 Oxycodone hydrochloride extended-release, 4642
 Oxymetholone, 4652
 Oxytetracycline, 4656
 Pancreatin, 4674
 Pancrelipase, 4677
 Pantoprazole sodium delayed-release, 4682
 Papain for topical solution, 4687
 Papaverine hydrochloride, 4688
 Paroxetine, 4698
 Penbutolol sulfate, 4702
 Penicillamine, 4706
 Penicillin G benzathine, 4710
 Penicillin G potassium, 4715
 Penicillin V, 4725
 Penicillin V potassium, 4728
 Pentazocine and acetaminophen, 4730
 Pentazocine and aspirin, 4731
 Pentazocine and naloxone, 4733
 Pentoxifylline extended-release, 4739
 Pergolide, 4746
 Perphenazine, 4750
 Perphenazine and amitriptyline hydrochloride, 4750
 Phenazopyridine hydrochloride, 4754
 Phendimetrazine tartrate, 4756
 Phenelzine sulfate, 4757
 Phenmetrazine hydrochloride, 4759
 Phenobarbital, 4761
 Phentermine hydrochloride, 4768
 Phenylbutazone, 4773
 Phenylpropanolamine hydrochloride, 4781
 Phenylpropanolamine hydrochloride extended-release, 4782
 Phenytoin chewable, 4785
 Phytonadione, 4796
 Pilocarpine hydrochloride, 4800
 Pimozide, 4802
 Pindolol, 4804
 Pioglitazone, 4807
 Piperazine citrate, 4816
 Potassium and sodium bicarbonates and citric acid effervescent, for oral solution, 4835
 Potassium bicarbonate effervescent for oral solution, 4833
 Potassium bicarbonate and potassium chloride effervescent, for oral solution, 4834
 Potassium chloride extended-release, 4841
 Potassium chloride, potassium bicarbonate, and potassium citrate effervescent, for oral solution, 4843
 Potassium citrate, 1566
 Potassium citrate extended-release, 4845
 Potassium gluconate, 4848
 Potassium iodide, 4853
 Potassium iodide delayed-release, 4853
 Pravastatin sodium, 4870
 Praziquantel, 4872
 Prednisolone, 4880
 Prednisone, 4889
 Primaquine phosphate, 4893
 Primidone, 4896
 Probenecid, 4898
 Probenecid and colchicine, 4899
 Probuco, 4901
 Procainamide hydrochloride, 4903
 Procainamide hydrochloride extended-release, 4904
 Prochlorperazine maleate, 4912
 Procydine hydrochloride, 4913
 Promazine hydrochloride, 4922
 Promethazine hydrochloride, 4924
 Propantheline bromide, 4928
 Propoxyphene hydrochloride and acetaminophen, 4938
 Propoxyphene napsylate, 4942
 Propoxyphene napsylate and acetaminophen, 4943
 Propoxyphene napsylate and aspirin, 4944
 Propranolol hydrochloride, 4948
 Propranolol hydrochloride and hydrochlorothiazide, 4951
 Propylthiouracil, 4957
 Protriptyline hydrochloride, 4959
 Pseudoephedrine hydrochloride, 4962
 Pseudoephedrine hydrochloride extended-release, 4962
 Pyrazinamide, 4973
 Pyridostigmine bromide, 4975
 Pyridoxine hydrochloride, 4977
 Pyrilamine maleate, 4979
 Pyrimethamine, 4981
 Pyrvinium pamoate, 4983
 Quazepam, 4984
 Quinapril, 4987
 Quinidine gluconate extended-release, 4990
 Quinidine sulfate, 4994
 Quinidine sulfate extended-release, 4994
 Quinine sulfate, 4997
 Raloxifene hydrochloride, 5003
 Ranitidine, 5012
 Rauwolfia serpentina, 5016
 Repaglinide, 5019
 Reserpine, 5023
 Reserpine and chlorothiazide, 5024
 Reserpine hydralazine hydrochloride and hydrochlorothiazide, 5025
 Reserpine and hydrochlorothiazide, 5028
 Ribavirin, 5033
 Riboflavin, 5037
 Rifampin, isoniazid, and pyrazinamide, 5046
 Rifampin, isoniazid, pyrazinamide, and ethambutol hydrochloride, 5047
 Riluzole, 5049
 Rimantadine hydrochloride, 5051
 Risedronate sodium, 5061
 Risperidone, 5065
 Risperidone orally disintegrating, 5067
 Ritodrine hydrochloride, 5069
 Ropinirole, 5080
 Rufinamide, 5089
 Saccharin sodium, 5096

Tablets (continued)

- Salsalate, 5104
 Scopolamine hydrobromide, 5115
 Selegiline hydrochloride, 5120
 Sennosides, 5126
 Sertraline, 5128, 5131
 Simethicone, 5143

 products derived from cell lines of human
 or animal origin (1050), 609
 Virology test methods (1237), 1025
 Viscosity (911), 434
 Vitamin
 A, 5575
 A assay (571), 236
 A capsules, 5576
 A oral liquid preparation, 5576
 A tablets, 5578
 B₁₂ activity assay (171), 132
 C and zinc lozenges, 1851
 D assay (581), 237
 D and calcium with minerals tablets, 1373
 D with calcium tablets, 1372
 E, 5579
 E capsules, 5581
 E polyethylene glycol succinate, 2274
 E preparation, 5582
 Vitamins
 capsules, oil-soluble, 1622
 capsules, oil- and water-soluble, 1664
 capsules, water-soluble, 1775
 with minerals capsules, oil- and water-
 soluble, 1710
 with minerals capsules, water-soluble, 1799
 with minerals oral solution, oil- and water-
 soluble, 1736
 with minerals oral solution, water-soluble,
 1818
 with minerals tablets, oil- and water-
 soluble, 1750
 with minerals tablets, water-soluble, 1827
 with minerals capsules, oil-soluble, 1638

Vitamins (*continued*)

- with minerals oral solution, oil-soluble, 1648
- with minerals tablets, oil-soluble, 1654
- oral solution, oil-soluble, 1628
- oral solution, oil- and water-soluble, 1683
- tablets, oil-soluble, 1631
- tablets, oil- and water-soluble, 1692
- tablets, water-soluble, 1787

Volumetric

- apparatus (31), 53
- solutions, 1218

Voriconazole, 5584

W

Warfarin sodium, 5587

- for injection, 5588
- tablets, 5588

Washed sand, 1205

Water

- Ammonia, stronger, 1141
- Ammonia, 25 percent, 1141
- Ammonia-free, 1205
- Carbon dioxide-free, 1205
- Cetyltrimethylammonium chloride, 25 percent in, 1153
- Deaerated, 1205
- Deuterated, 1157
- D-Gluconic acid, 50 percent in, 1167
- For hemodialysis, 5589
- Hydrazine hydrate, 85% in, 1169
- For inhalation, sterile, 5590
- For injection, 5589
- For injection, bacteriostatic, 5590
- For injection, sterile, 5591
- For irrigation, sterile, 5591
- Methylamine, 40 percent in, 1176
- O 15 injection, 4650
- Peppermint, 2125
- Pure steam, 5592
- Purified, 5591
- Purified, sterile, 5592
- Rose ointment, 5085
- Rose, stronger, 2189
- Soluble vitamins capsules, 1775
- Soluble vitamins with minerals capsules, 1799
- Soluble vitamins with minerals oral solution, 1818
- Soluble vitamins with minerals tablets, 1827
- Soluble vitamins tablets, 1787
- Stronger ammonia, 1197
- Vapor detector tube, 1205
- Vitamins capsules, and oil-soluble, 1664
- Vitamins with minerals capsules, oil-soluble, 1710
- Vitamins with minerals oral solution, oil-soluble, 1736
- Vitamins with minerals tablets, and oil-soluble, 1750
- Vitamins oral solution, oil-soluble, 1683
- Vitamins tablets, oil-soluble, 1692

- Water conductivity (645), 277
- Water determination (921), 439
- Water for hemodialysis applications (1230), 991
- Water for pharmaceutical purposes (1231), 992
- Water–solid interactions in pharmaceutical systems (1241), 1050

Wax

- carnauba, 2275
- emulsifying, 2276
- microcrystalline, 2276
- white, 2277
- yellow, 2277
- Weighing on an analytical balance (1251), 1054
- Weight variation of dietary supplements (2091), 1116
- Weights and balances (41), 53
- Wheat
 - bran, 5592
 - starch, 2246
- Witch hazel, 5593
- Wound matrix small intestinal submucosa, 5594
- Wright's stain, 1205
- Written prescription drug information—guidelines (1265), 1057

X

Xanthan gum, 2278

- solution, 2279
- Xanthine, 1205
- Xanthidrol, 1205
- Xenon Xe 127, 5598
- Xenon Xe 133, 5598
- injection, 5598
- X-ray diffraction (941), 443
- Xylazine, 5599
 - hydrochloride, 5600
 - injection, 5601
- Xylene, 1206
 - m*-Xylene, 1206
 - o*-Xylene, 1206
 - p*-Xylene, 1206
- Xylene cyanole FF, 1206
- Xylenol orange, 1208
 - TS, 1218
- Xylitol, 2279
- Xylometazoline hydrochloride, 5601
 - nasal solution, 5602
- Xylose, 1206, 5603

Y

Yeast extract, 1206

- Yellow mercuric oxide, 1206
- Yohimbine
 - hydrochloride, 5604
 - injection, 5604

Yttrium Y 90 ibritumomab tiuxetan injection, 5605

Z

- Zalcitabine, 5607
 - tablets, 5608
- Zaleplon, 5608
 - capsules, 5610
- meso*-Zeaxanthin, 1846
 - preparation, 1847
- Zein, 2280
- Zidovudine, 5611
 - capsules, 5613
 - injection, 5614
 - and lamivudine tablets, 4052
 - oral solution, 5615
 - tablets, 5616
- Zileuton, 5617
- Zinc, 1206
 - acetate, 1206, 5620
 - activated, 1206
 - amalgam, 1206
 - carbonate, 5620
 - chloride, 5621
 - chloride, anhydrous, powdered, 1206
 - chloride injection, 5622
 - citrate, 1849
 - citrate tablets, 1849
 - determination (591), 241
 - gluconate, 5622
 - gluconate tablets, 5624
 - oxide, 5625
 - oxide neutral, 5625
 - oxide ointment, 5626
 - oxide paste, 5627
 - oxide and salicylic acid paste, 5627
 - stearate, 5627
 - sulfate, 5628
 - sulfate heptahydrate, 1206
 - sulfate injection, 5629
 - sulfate ophthalmic solution, 5629
 - sulfate oral solution, 5630
 - sulfate tablets, 5630
 - sulfate, twentieth-molar (0.05 M), 1226
 - sulfide topical suspension, 5631
 - undecylenate, 5631
 - uranyl acetate TS, 1218
 - and vitamin C lozenges, 1851
- Ziprasidone hydrochloride, 5631
- Zirconyl
 - chloride, octahydrate, basic, 1206
 - nitrate, 1206
- Zolazepam
 - hydrochloride, 5634
 - and tiletamine for injection, 5397
- Zolpidem tartrate, 5635
 - tablets, 5636
 - extended-release tablets, 5637
- Zonisamide, 5639
 - capsules, 5640
